Mangalore, mǎng-ga-lōr', India, a seaport town, on the Malabar coast, capital of the district of South Kanara, Madras presidency. It is clean and well built, surrounded by groves of coconut palms, and stands on the edge of a fine salt-water lake or back-water formed at the mouths of two rivers. The port will not admit of vessels drawing more than 10 feet of water, except in spring tides; but there is good anchorage off the mouth of the river, in 5 to 7 fathoms. The exports are principally coffee, rice, sandal-wood, cassia, and turmeric; the imports sugar, salt, and piece-goods. There is a Roman Catholic college; and the Basel Lutheran mission in India has its headquarters here. The Roman Catholics have a bishop and several churches, a considerable number of the natives belonging to this faith. Pop. (1901) 44,108.

Manganese, mǎn-ga-nēs', a metallic element which is widely distributed in nature, though it never occurs except in combination with other elements. The dioxid was believed to be a compound of iron until 1774, when Scheele proved it to be a compound of a previously unknown metal; and in the same year Gahn prepared the element in its metallic form. It was first called "magnesium," from the fact that it was prepared from a compound then called "magnesia nigra" (and now known as manganese peroxid or dioxid); but in 1808 the name was arbitrarily changed to "manganese," by Buttman.

Manganese may be prepared in the metallic form by reducing any of its oxids with carbon at a white heat, and this is the method followed commercially. For experimental purposes, however, it is easier to obtain it by reducing the chloride with metallic sodium or magnesium. The physical properties of manganese vary somewhat according to the precise way in which the metal is obtained. Its melting-point may be taken as 3500° F., its specific gravity as 7.4, and its specific heat is 0.122. It is a gray, hard,

MANGANESE BRONZE — MANGASARIAN

brittle, lustrous metal, susceptible of taking a high polish, and resembling iron in most respects, both physically and chemically. It is not magnetic, however. The pure metal does not appear to be affected by dry air, but moist air oxidizes it, at least superficially. Some authorities describe it as oxidizing readily in common air, and as decomposing water with almost as great a facility as potassium; but it appears probable that the specimens from which these results were obtained contained impurities of some sort. Metallic manganese is not used in the arts, but some of its alloys with iron, aluminum and copper are valuable. It is particularly valuable in steel, its presence in small amount increasing the hardness, tenacity and elasticity of the metal. It is added to the molten steel, in the process of manufacture, in the form of an iron-manganese alloy containing from 10 to 80 per cent of the latter metal, and known in the arts as "spiegeleisen" or "ferromanganese." The "manganese" of commerce is usually not the metal itself, but a mixture of its oxids.

Chemically, manganese is a dyad. It has the symbol Mn, and an atomic weight of 55 if $O=16$, or 54.6 if $H=1$. It forms numerous oxids, the best known of which are (1) the monoxid, MnO , from which the manganous salts may be prepared, and which is itself obtained by heating manganese carbonate out of contact with the air; (2) the sesquioxid, Mn_2O_3 , which exists in nature as the mineral braunite, and which is also formed when the monoxid is heated in air to a red heat; (3) the red or mangano-manganic oxid, Mn_3O_4 , which corresponds to the magnetic oxid of iron, does not form salts, and exists in nature as the mineral hausmannite; (4) the black oxid, or dioxid, MnO_2 , which occurs in nature as pyrolusite and varvacite, and which is largely used in the arts in the preparation of oxygen and chlorine; (5) the trioxid, MnO_3 , which is difficult of preparation and very unstable; and (6) the heptoxid, Mn_7O_{10} , a heavy, dark green liquid, prepared by treating potassium permanganate with cold concentrated sulphuric acid. Several of these oxids also occur in a hydrated form, as minerals. Of the soluble manganous salts, the chief representatives are the sulphate and the chloride. Manganous sulphate, $MnSO_4$, is prepared by treating the dioxid with sulphuric acid, oxygen being liberated at the same time in accordance with the equation $MnO_2 + H_2SO_4 = MnSO_4 + O + H_2O$. It crystallizes with five molecules of water, as a pink-colored salt, and is used dyeing and in medicine. The chloride, $MnCl_2$, crystallizes with four molecules of water, and is obtained as a by-product in the manufacture of chlorine by the action of hydrochloric acid upon manganese dioxid. It is used in calico printing. Of the insoluble manganese salts we may specially note the sulphid and the carbonate. The sulphid, MnS , is thrown down as a flesh-colored precipitate, when a soluble manganous salt is precipitated by an alkaline sulphid. The carbonate, $MnCO_3$, occurs native as the mineral rhodochrosite, and it may also be obtained as a white precipitate by adding an alkaline carbonate to a solution of manganous sulphate or chloride.

Two other important classes of manganese compounds are known, in which the manganese does not act as a base, but as an acid-forming element. These are the manganates and per-

manganates, which may be regarded as the salts of "manganic acid," H_2MnO_4 , and "permanganic acid," $HMnO_4$, respectively. The potassium salts of these acids are by far the most important ones. Potassium manganate, K_2MnO_4 , may be prepared by melting manganese dioxid with caustic potash and a little potassium chlorate, dissolving the bright green mass so obtained in a small quantity of water, and crystallizing by evaporation in a vacuum. Potassium manganate is used in laboratory operations, but it is very unstable, taking up oxygen with great readiness, and depositing hydrated dioxid of manganese. If the green solution containing potassium manganate be allowed to stand in the air, it absorbs oxygen, changes in color to a bright purple, and deposits hydrated manganese dioxid. The purple color is due to the presence of potassium permanganate, $KMnO_4$, which may be obtained, by crystallization, in the form of purple prismatic crystals. Potassium permanganate is a powerful oxidizing agent, and is extensively used in chemistry, in the arts, and in medicine, on account of the facility with which it parts with oxygen, especially in the presence of organic matter. It forms the basis of "Condy's fluid," which is largely used as a disinfectant.

Manganese Bronze, a metallic element in which the copper forming the base of the alloy is mixed with a certain proportion of ferromanganese, and which has exceptional qualities in the way of strength and hardness. Various qualities are manufactured, each suited for certain special purposes. One quality, in which the zinc alloyed with the treated copper is considerably in excess of the tin, is made into rods and plates, and when simply cast is said to have a tensile strength of about 24 tons per square inch. Another quality has all the characteristics of forged steel without any of its defects. Another quality is in extensive use for toothed wheels, gearing, brackets, and all kinds of machinery supports. From its non-liability to corrosion it is largely employed in the manufacture of propellers.

Man'ganite, native hydrated oxid of manganese, $MnO(OH)$, or $Mn_2O_3 \cdot H_2O$. It crystallizes in the orthorhombic system, but also occurs in columnar and stalactitic forms. It is brittle, and has a hardness of 4 and a specific gravity of about 4.3. It is steel gray to iron black in color, and opaque with a submetallic lustre. It occurs in the Harz region, in Norway and Sweden, and in the British Isles. In the United States it is found in the Lake Superior mining district, and in Douglas County, Colo. It also occurs in Nova Scotia and New Brunswick. Manganite is used as a source of manganese for the preparation of spiegeleisen and other alloys, and also in the manufacture of pigments and dyes.

Mangasa'rian, Mangasar M., American author and lecturer: b. Constantinople, Turkey, 29 Dec. 1869. He was educated in Constantinople and at Princeton Theological Seminary, New Jersey, and has traveled and lectured widely. At the Grand Opera House, Chicago, he at present (1903) lectures weekly to the Independent Religious Society. Among the best known of his writings are: 'Omar Khayyam' (1901); 'Christian Science, a Comedy in Four

MANGATAREN—MANGUANGAS

Acts' (1903); 'European Criticism of America' (1903).

Mangataren, män-gä-tä'rën, Philippines, a pueblo of the province of Pangasinán, Luzon, 18 miles south of Lingayén; it is on the Agno River road. Pop. 10,150.

Mange, a cutaneous disease to which dogs, horses, cattle, etc., are liable. It resembles in some measure the itch in the human subject, ordinary mange being due to the presence of a burrowing parasite. Both local application and internal remedies are used in its cure. Frequent washing of the skin is essential. See ITCH.

Mangel-Wurzel. See BEET.

Mangle, a machine for smoothing linen and cotton goods. See LAUNDRY MACHINERY.

Mango, mǎng'gō, a genus of trees (*Mangifera*) of the order *Anacardiaceæ*. The 30 species are natives of southeastern Asia, whence some of them have been distributed by man throughout the tropics of both hemispheres. The wood of various species is used for boat and canoe making, for house building, and for boxes. It is gray, rather soft, and easily worked. The trees are valued also for shade, being of large size, attractive form and very leafy, the leaves large, leathery and evergreen. It is for their fruits, however, that they are most esteemed. These are widely used for human food especially in the East, either ripe, in which condition they are eaten raw, with or without wine, sugar and spices, or unripe as preserves, jellies, pies or pickles. They are also used for making wine and glucose. The finer varieties are considered equal to the choicest pineapples and even to the mangosteen.

The most commonly planted and most widely distributed species is the common mango (*M. indica*), a native of India. It often exceeds 40 feet in height, bears terminal panicles of rather small pinkish or yellow flowers, followed by smooth kidney-shaped yellow or reddish fruits which often weigh more than half a pound. Each fruit contains one large flattened seed, almost as long and often nearly as wide as the fruit, but flattened like the seed of a melon. The kernel is often roasted and eaten like chestnuts. The pulp of the fruit is soft, luscious in the finer varieties but very fibrous in the inferior sorts. These have a more or less pronounced flavor, suggestive of turpentine, which is characteristic of all parts of the tree. Since 1782, when the mango was introduced into Jamaica with a lot of other plants taken from a French vessel captured on its way to Haiti, the fruit has spread throughout the West Indies and southern Florida. In Florida, however, the freeze of 1886 destroyed all trees except those in the extreme southern part, where the mango is now confined. The market, which seems to be growing but is somewhat limited because of the prevailing ignorance regarding the fruit, is supplied mainly from the West Indies. California supplies little more than its home markets. The trees do best upon well drained sandy land, and should be well supplied with potassic manures. They quickly fail to bear upon wet soils. They may be propagated by grafting, but since a large proportion of the varieties reproduce practically without change by seedage, this method is widely employed.

Several other species of mangoes are culti-

vated. For instance, the horse mango (*M. fetida*), a native of Malacca, is cultivated in India, and *M. sylvatica*, whose fruits are dried and used like prunes.

Mango-bird. Several birds are called mango-birds in various parts of the world because they frequent mango-trees. The East Indian one is an oriole (*Oriolus kundoo*); the West Indian one, so called in Jamaica, is a humming-bird (*Lampornis violaceauda*), which may occasionally visit Florida.

Mango-fish, one of the threadfins (q.v.), a small perch-like sea-fish (*Polynemus plebius*) which is numerous along Oriental coasts, and approaches the shore and is caught at the time when mangoes ripen. The same name is sometimes given to a relative in the West Indies (*Polydactylus virginicus*), called barbudo in the Cuban markets.

Mangosteen, the fruit of an East Indian tree (*Garcinia mangostana*) of the order *Guttifera*, which contains many Oriental trees of useful properties. The mangosteen resembles an orange in size and in the wedge-like segments of its interior; in color its thick rind is reddish brown, and the cool juicy pulp is esteemed as among the most delicious of Oriental fruits. The tree grows to a height of 20 to 30 feet, has large, thick shining leaves, bears large deep-red four-petaled flowers, and is largely cultivated throughout the East. The group contains some 40 African and Oriental trees, which furnish astringent medicinal bark, etc., the oily material called kokum-butter (from *G. indica*), and the pigment-gum called gamboge (q.v.).

Mangrove, mǎng'grōv, a genus of trees and shrubs (*Rhizophora*) of the natural order *Rhizophoraceæ*. The species, of which there are less than half a dozen, are all natives of the tropics, where they inhabit tidal marshes and the mouths of streams. They are remarkable for their aerial roots, which extend from the branches to the mud and then become trunks for the extension of the trees which gradually advance even to low tidal mark; and also for their peculiar method of seed germination, the seeds sprouting while still attached to the twigs. The wood, which in some species is close-grained and durable, is used for fuel and to a small extent for other purposes; the bark, which is rich in tannic acid, is employed in tanning; the fruit of some species is edible and is used for wine making. The trees are important soil builders, their numerous roots serving to catch debris and by checking the current enhance the settling of mud from the water. Hundreds of acres of arable land have thus been formed in Florida, and the Keys where mangrove groves are very common. The best known species is *R. mangle*.

Mangrove Hen, a West Indian clapper-rail (*Rallus longirostris*), which seeks its food in the mangrove swamps.

Mangrove Snapper, the gray snapper, an excellent food-fish, which abounds among the mangroves along the coasts of Florida and the Bahamas, and thence to Brazil. See SNAPPER.

Manguangas, män-gwǎn'gās, a collective name for a number of heathen tribes living in the forests of the island of Mindanao, Philippines. They are of the Malay race. See PHILIPPINE ISLANDS.

MANGUIANES — MANICHÆANS

Manguianes, mǎn-gē-ānz', the natives of the interior of Mindoro, Romblon and Tablas (qq.v.), Philippines; they are divided into four branches, one of which is of Negrito blood, another is Mongoloid, and the other two are of the Malayan race. There are several tribes, including the Bangot, the Buquil, etc. The term is also used in the island of Palawan to designate all wild natives of unknown origin.

Mangum, mǎng'gūm, **Willie Person**, American legislator: b. Orange County, N. C., 1792; d. Red Mountain, N. C., 14 Sept. 1861. He was graduated from the University of North Carolina in 1815, was admitted to the bar in 1817, in 1818 was a member from Orange County of the lower house of the State legislature, and in 1819 became a judge of the superior court. From 1 Dec. 1823 to 18 March 1826 he was a Whig representative in the 18th and 19th Congresses; but this post he resigned, and again he was elected a judge of the superior court. He retired from the court in 1826, but filled the office a third time in 1828-30. He was a United States senator from 5 Dec. 1831 to 1836, when he resigned, and from 9 Dec. 1840 to 3 March 1853; and in 1842-5 was president *pro tempore* of the Senate. Throughout nearly his entire term of service in Congress he was a leader of the Whigs; and in 1837 he received the 11 electoral votes from South Carolina for the presidency of the United States.

Manhat'tan, one of the boroughs comprising the city of New York. See **NEW YORK CITY**.

Manhattan, Kan., city, county-seat of Riley County; on the Kansas River, at the junction of the Big Blue, and on the Chicago, R. I. & P. and the Union P. R.R.'s; about 55 miles west of Topeka. The surrounding region is mainly agricultural; limestone quarries are in the vicinity. The chief industrial establishments are a foundry, machine shops, flour mills, lumber and brick yards. Manhattan is the trade centre for a large section and ships live-stock, grain, and limestone. The city owns and operates the waterworks. Pop. (1900) 3,438.

Manhattan College, an institution in Manhattan borough of New York city directed by the Christian Brothers. It was opened originally (1849) as an academy for young men, under the name of the Academy of the Holy Name, but the constant increase of the student body and the consequent demand for higher branches of study forced the academy to adopt the college courses, which was done in 1853, the academy being then incorporated under the name of Manhattan College. The courses lead to the degrees of B.A., M.A., B.S., and C.E. The resources of the college are derived from tuition only, there being no endowment. The institution reported at the end of 1903: professors and instructors, 25; students, 394; volumes in library, 9,459; value of grounds and buildings, \$625,000; income, \$47,000; number of graduates, 932.

Manhattan Island. See **NEW YORK CITY**.

Mani, mā'nē, the founder of the sect of Manichæans. See **MANICHÆANS**.

Man'ia. See **INSANITY**.

Manicaland, mā-nē'ka-lānd, South Africa, a portion of southern Rhodesia, situated on the border of Portuguese East Africa, east of

Mashonaland, between the parallels of 18° and 21° S., and the meridians of 31° 30' and 33° E. It has an area of some 10,000 square miles, generally fertile, and is traversed by the railroad from Beira to Fort Salisbury. The river Sabi flows southward through Manicaland, and on the eastern side there are mountains of considerable height. Gold is found in the neighborhood of the chief town, New Umtali. The boundary between British and Portuguese territory in this district was finally settled in 1892 after some trouble.

Manichæans, mǎn-i-kē'anz, the followers of Manes, Mani, or Manichæus, as he is variously styled, a Gnostic teacher, whose opinions prevailed in Western Asia and Eastern Europe during the 4th and 5th centuries of our era. Manichæism is generally considered to be the Persian type of gnosis, as it is distinguished by Zoroastrian dualism, and other features of that system. Hebrew elements of religion and Buddhist doctrines were also found in Manichæism, which appears to have been an eclectic jumble of wild fancies, among which the soberest and strongest dogmas of the Christian creed were sometimes seen to be embedded. The dualism of Manes was conceived of by him as manifested in two contiguous realms of light and darkness, good and evil. The kingdom of light included a heaven and an earth, the latter guarded by æons, or good spirits, and presided over by a spirit of goodness. From the kingdom of darkness sprang Satan and his evil angels. This confusion and mixture, in the universe, of light and darkness, originated before the creation of man, a creature of light and darkness combined in proportions varying in each individual. The human race is finally to be purged of darkness and sin. Jesus Christ was looked upon as dual in nature; there was Jesus who did not and could not suffer, *Jesus impatibilis*, a sort of phantom or immaterial personage, and *Jesus patibilis*, who suffered death upon the cross.

The practical side of Manichæism appears in the condemnation of marriage, or sexual indulgence of any sort, and the ascetic purification of hands, mouth, or bosom, which kept the initiated from eating animal food, contracting ceremonial defilement through the touch and indulging the flame of human passion in the heart. There were two classes of disciples, the initiated, or *perfecti*, and the *auditores*, hearers, or novices. St. Augustine of Hippo was, for nine years before his conversion to Christianity, a Manichæan hearer. These hearers lived a much less strict life than the perfecti, and constituted by far the majority of the Manichæan sect. The clergy of this sect were organized after the model of the Christian ministry; their rite of baptism was performed with oil instead of water; they had also a eucharistic meal among their public ceremonies. The system spread rapidly through the Roman empire and competed with Neo-Platonism in hostility to the Church. Diocletian persecuted the Manichæans, and under Justinian the profession of Manichæism was a capital crime. The system, however, flourished in Asia beyond the 10th century and has reappeared in some shape or other, and under different names at different times in subsequent periods of European history. Consult: Routh, (*Acta Disputationis Archelai*) (1848); Eusebius, (*Æclesiastical History*); De Beausobre, (*Histoire*

MANIFESTO — MANILA

critique du Manichéisme' (1734); and Harnack, 'History of Dogma' (1897).

Manifesto, in international law, a declaration publicly issued at the commencement of a war by the contending powers to show the causes which justify such a measure. Manifestoes are in the form of public letters; they commence with a short address to the public in general, and are signed with the name of the person who issues them. See LAW, INTERNATIONAL.

Manifolds, Theory of. See ASSEMBLAGES, GENERAL THEORY OF.

Manigault, Arthur Middleton, American soldier: b. Charleston, S. C., October 1824; d. 16 Aug. 1886. In 1846 he was elected 1st lieutenant of the Charleston company in the "Palmetto" regiment for the Mexican War, throughout which he served. In June 1861 he was elected colonel of the 10th regiment, South Carolina infantry, and in 1861-2 was in command of the 1st South Carolina military district. From the early part of 1862 he served in the army of the West successively under Bragg, Johnston, and Hood, in 1862 was placed in command of a brigade, and in 1863 made brigadier-general. At Chickamauga he distinguished himself by his repeated assaults, and in the retreat before Sherman's invasion he did some vigorous fighting. His death was hastened by a wound received in the battle of Franklin, Tenn. (30 Nov. 1864). Subsequent to the war he was elected by the Democrats adjutant-general of South Carolina, served by two re-elections until his death, and at that time was a candidate for a fourth term.

Man'ihot. See CASSAVA.

Manila, *ma-ni-l'a* or *mā-nē-lā*, the capital of the Philippine Islands, the principal city of Luzon as well as of the archipelago, situated in lat. 14° 35' 31" N. by lon. 120° 58' 08" E., lies on both sides of the Pasig River, and has a frontage of four miles on the bay of Manila. The corporate jurisdiction for police purposes extends three miles from the shore over Manila Bay, making the total area under the police jurisdiction of the city 32 square miles or 20 square miles on land, and 12 on the bay. The name of the city is a corrupt form of a Tagalog word, originally written "Maynila," and means a species of shrub or bush which formerly grew on the site of the city. It is now applied not merely to the town within the walls, but to the whole region and the inhabitants included within the corporate limits. The most important divisions of the city are the walled town, particularly known as Manila, on the left bank of the river and Binondo on the right bank. Other districts, formerly more independent than at present, have retained their names and some degree of individuality. Immediately south of the walled town lies Ermita; farther on along the shore is Malate; and inland directly east of these lie Paco, Pandacan, and Santa Ana. The most northern district on the shore of the bay is Tondo, and between this district and the lower part and mouth of the river lies San Nicolas. The other districts north of the Pasig are Quiapo, San Miguel, Sampaloc, Santa Cruz, and Trozo.

The walled town was occupied chiefly by the members of the Spanish colony. Its streets are straight and run at right angles with one

another, dividing the area within the wall into 54 blocks. The buildings have usually two stories, and are built like the houses of Spanish cities. It contains the cathedral, the principal religious houses and churches of the ecclesiastical orders, various schools, the University of St. Thomas, the hospital of San Juan de Dios, the mint, and the building known as the palace containing the offices of the government. The most imposing of these is the cathedral, a Roman Byzantine structure, which occupies a part of the site of the cathedral destroyed by the earthquake of 1880.

The north wall of the town extends along the bank of the Pasig. Around the outside of the rest of the wall, runs a moat receiving water from the river just east of the town and emptying into the river just west of it. Until 1852 the drawbridges across the moat at the several gates were raised every evening at 11 o'clock, and lowered in the morning at 4. Since then it has not been customary to close the gates.

Only a few of the streets of Manila, of which there are about 80 miles, are paved. The rest are macadamized. European and American retail shops occupy the Escolta, in Binondo. The street called Rosario is almost entirely given up to Chinese shops. The wholesale houses and the banks occupy the district north of the Pasig and west of the Bridge of Spain.

Miguel Lopez de Legaspi established Spanish authority at Manila in 1571, by a treaty with Lacandola, Rajah of Maynila, which was confirmed by the compact of blood made between the contracting parties. On 3 June 1571, he conferred upon Manila the title of "distinguished and ever loyal city." This title was subsequently confirmed by royal decree. He also gave the city a municipal organization, by appointing two *alcaldes*, one *aguacil mayor*, and twelve *regidores*. He also appointed one notary for the *cabildo*, or corporation, and two notaries public for the court of the *alcaldes*. Later there were only eight *regidores*, but in addition a registrar and a constable. The *alcaldes* were justices, and were elected annually from the householders by the corporation. The *regidores* were aldermen and with the registrar and constable held office permanently as a proprietary right. The permanent positions in the *cabildo* could be bought and sold or inherited. This form of organization was maintained throughout the Spanish period.

In 1578 the church and all the inhabitants of Manila were separated from the jurisdiction of the archbishop of Mexico, and the church was erected into a cathedral, but the new bishop was subject to the archbishop of Mexico. On account of the long time needed to communicate between Spain and the Philippines the king ordered the governor of the islands to fill vacancies in the cathedral whenever they might occur.

As early as the beginning of the 17th century the city of Manila was surrounded by a wall of hewn stone about three miles in circuit. It contained a college conducted by the Jesuits, a school for girls called the Santa Potenciana, two hospitals, one for Spaniards and one for Filipinos, a house of mercy for receiving sick slaves and furnishing lodgings to poor women, and a hospital for Chinese. At this time there

MANILA BAY—MANILA HEMP

were within the walls about 600 houses built of stone and mostly occupied by Spaniards. There were also about 2,000 Chinese, with 200 shops, and a garrison of 200 soldiers.

In the war between England and Spain, in 1762, Vice Admiral Samuel Cornish was ordered to proceed against Manila. He carried British and Sepoy forces under Sir William Draper. On 6 Oct. 1762 Archbishop Rajo, as acting governor, surrendered the city, agreeing to pay the British an indemnity of \$4,000,000. Only a part of this was paid. The affairs of Manila were administered by the British military authorities until 10 Feb. 1763. After this Manila remained uninterruptedly under the control of the Spanish until 13 Aug. 1898, when it was surrendered to the authorities of the United States. On 20 August the military government opened the custom-house for business, continuing in force the Spanish tariff and customs regulations. In 1899 the Filipinos in insurrection made several attempts to destroy the city. The attempts on 4 and 22 February resulted disastrously to the insurgents. A similar undertaking was planned for the occasion of General Lawton's funeral.

The political relation of Manila to the central government of the islands is not greatly unlike that which Washington holds to the Federal government of the United States. The city was incorporated by an act passed by the United States Philippine Commission on 31 July 1901. This act vests the government in a municipal board of three members appointed by the civil governor, with the advice and consent of the Commission. The municipal board has certain legislative and executive authority. The organic act provides also for a secretary and other officers, and prescribes their powers and duties. Appropriations for city purposes are made by the Commission on estimates submitted by the board. Thirty per cent of the expenses of the city are paid by the central government, and the balance is met by funds derived from city taxes. All moneys collected in the city are paid into the Insular Treasury, and are there subject to appropriation by the Commission. All municipal accounts of receipts and expenditures are examined by the Insular Auditor.

Vessels approaching Manila by sea from the northwest first sight the Capones Grande light off the southwest coast of Zambales. Vessels from the ports of Indo-China first sight the Corregidor light in the centre. Vessels from Singapore, Java, India, Borneo, and all the southern ports of the Philippine Islands sight the Cabra Island light. All converge on the Corregidor light at the entrance of the bay.

The inhabitants of Manila number 297,154, consisting of 218,900 Filipinos, 60,680 Chinese, 7,852 foreigners, 6,462 Americans, and 3,260 members of the United States army.

Water for Manila is distributed from a reservoir consisting of intersecting tunnels in a low hill about three miles from the city. The reservoir is supplied by pumping the water from the Maraquina River at a point three miles farther away. The waterworks are owned by the city, having been constructed with funds received as a legacy from Francisco Carriedo, who died in 1743. The amount of water consumed in Manila was in 1897, 6,441,011 cubic

metres; in 1900, 8,305,611 cubic metres; in 1901, 9,252,844 cubic metres; in 1902, 10,593,794 cubic metres. The total annual capacity of the present pumping plant is 13,140,000 cubic metres.

The Luneta is an elliptical drive and promenade on the shore of the bay between the city wall and the houses of Ermita. It has been greatly enlarged by the American government, and it has ceased to be a place for public executions. A military band gives a concert here nearly every evening. Between five and eight o'clock the driveway is thronged with carriages, and persons on foot fill the space about the band stands.

Among the statues adorning public places the most noteworthy are that of Charles IV. in the square in front of the "Palace" or Ayuntamiento building, that of Isabella II. in the plaza of Malate, and that of Legaspi and Urdaneta near the Luneta. The several parts of the last mentioned monument were found in the city and erected by the American authorities. Other monuments are the Magellan column standing on the south bank of the river just below the Bridge of Spain, and the Anda monument on the same bank of the river at the end of the Malacaon drive, which runs between the western wall and the shore of the bay. The three other bridges which span the river are the new steel Santa Cruz bridge, the suspension bridge, and the Ayala bridge.

Among the noteworthy establishments or institutions in the city are the civil hospital, the hospitals of San Lazaro and San Juan de Dios, the trade school, the normal school, the public library, the government laboratories, the government printing office, and the government cold storage and ice plant.

BERNARD MOSES,
University of California.

Manila Bay, the largest bay in the Philippine archipelago, indenting the western central coast of the island of Luzon. Its greatest dimensions are from Tutubatu Island in the northwest to Las Pinas on the southeastern shore, 35 miles, and from the delta of the Grande de la Pampanga River southwest to Corregidor Island, 31 miles; circumference 120 miles. The entrance from Pulo Munti Point to Restinga Point is 12½ miles and is divided into two channels by the islands of Corregidor and Pulo Cabello. The bay is surrounded by five provinces, and receives the waters of many rivers, including the Grande de la Pampanga, with its large delta, and the Pasig at Manila. The land on both sides of the bay at the entrance are high and covered with vegetation, but the shores at the head of the bay are low and marshy, intersected by numerous small rivers, estuaries, and tidal lakes. It is one of the finest harbors in the East, being free of obstructions to navigation, and affording excellent anchorage. Manila, the capital of the archipelago, and Cavite, the United States naval headquarters in the Philippines, are on its shores; an artificial port is being constructed at Manila. In this bay Admiral Dewey won a victory over the Spanish fleet 1 May 1898.

Manila Hemp, or *Abaca*, *Musa textilis*. This species belongs to the plantain or banana family, the commercial fibre being derived from

MANILA.

1. La Escolta.

2. The Bridge of Spain.

the stalk or trunk of the wild plantain of the Philippine Islands, and is classed as a structural fibre. The strongest and best of our hard cordage fibres, it is employed in the United States for standard binder twine, and for all sizes of rope from the smallest dimensions to hawsers and cables. The old rope and the waste are employed as paper stock. The fibre is creamy white to reddish white, lustrous, easily separated, stiff and resistant, while its lightness makes it advantageous for employment in cordage for the rigging and running ropes of ships. Structurally the bundles of fibres are very large, but easily separated into fibres of even diameter; the walls of the cells are of uniform thickness, growing slender toward the ends gradually and regularly. In breakage tests for textile strength, with English hemp — made by the British government — Manila stood a strain of 4,669 pounds against 3,885 pounds for hemp, ropes $3\frac{3}{4}$ inches in circumference and 2 fathoms long being used in each test. In the Philippine Islands the finer grades of the fibre are extensively used for fabric manufacture, the product being worn by the natives of both sexes throughout the archipelago. Mixed with cotton a durable fabric is produced well adapted to the climatic conditions of the islands. According to a recent report of the Philippine Bureau of Agriculture, the Manila hemp plant was introduced into India in 1859, and the Andaman Islands in 1873. The plant is also said to be found in Borneo and Java, and attempts have been made to introduce it into other countries. It remains a fact, however, that the commercial fibre is produced only in the Philippines. The culture has been attempted without success in the West Indies, and seed was imported for trial in Florida only a few years ago, by the writer, but it failed to germinate. Several species of banana yielding fair fibre are successfully cultivated throughout tropical and sub-tropical America, and in many other portions of the world. Banana fibre bears no comparison, however, with the Manila hemp of commerce, although the fibre of *Musa basjos* is produced commercially in Japan where it is employed for undergarments for summer wear, as well as for light dresses for the higher classes of Japanese.

Manila hemp first attracted attention commercially early in the last century, and was imported into Salem, and Boston, Mass., about 1824; samples of the fibre, however, were brought to this country by naval officers as early as 1820. The production of the textile had reached about 8,000 tons in 1840, 30,000 tons in 1860, and 50,000 tons in 1880. In 1900 the production was nearly 90,000 tons, and at the present time represents over 62 per cent of the Philippine exports. The United States consumed last year 56,455 tons of the fibre, valued at \$10,558,381.

Regarding the specific localities of production and details of cultivation, preparation, etc., the student is referred to Bulletin of the Royal Gardens Kew (August 1894), to a Descriptive Catalogue of Useful Fibre Plants of the World (Washington 1897), and to Farmer's Bulletin (No. 4, pub. 1903), by the Philippine Bureau of Agriculture, Manila.

The extraction of the fibre is a simple proposition. The *abaca* is cut near the roots when the plant is two to four years old, and just before blossoming; if cut earlier the fibre is finer

but shorter. After striking off the leaves the trunk or stem is slit from end to end, and the sheathing layers of cellular matter, which form the petioles of the leaves are separated, dried a day or two and then cut into strips three inches wide, and finally scraped until the fibre has been cleaned of all extraneous matters, soft cellular tissue, etc. The bundles of wet fibre are shaken into filaments, washed, dried and sorted. This is the export fibre for cordage purposes, the fabric fibre necessitating further treatment by beating, which softens and subdivides the filaments. The export fibre is wrought into hanks and made into bales of about 270 pounds, when it is ready for shipment. Attempts to use machinery for extracting the fibre have not been successful, partly because the machines have not been adequate, and partly on account of native prejudice. There is great waste by the hand methods of preparation which it is thought machine extraction would obviate. See FIBRE; HEMP; JUTE; RAMIE; SISAL.

CHAS. RICHARDS DODGE.

Manila, University of, founded in 1585 by Philip II. of Spain. Later branches or affiliated schools were founded in different parts of the island. A seminary for the sons of Spanish nobles was opened in 1601, and 10 years later departments were added for the sons of those not belonging to the nobility and for the natives. The university was reorganized in 1857. The departments are science, classics, law, medicine, theology, philosophy, pharmacy, arts and music. The usual degrees are granted. In 1901 there were over 1,000 students in attendance.

Manin, mā-nēn', Daniele, Italian patriot: b. Venice 13 May 1804; d. Paris 22 Sept. 1857. He studied at the University of Padua, was admitted to the doctorate of laws, and practised at the bar. In politics he became the leader of the liberal class, and by 1847 had secured a solid reputation as a political economist. For anti-Austrian utterances made during that year and the next he was twice imprisoned, but while awaiting trial was set free by the populace upon arrival of news of the revolution of 1848 in Italy and France, was made President of the Republic of Saint Mark, and given supreme power as head of the patriotic revolt. The Austrians were driven out, and during the siege, which began in the autumn of 1848 and lasted 12 months, Manin was at the head of the civil government, and to his counsels and patriotic spirit it was mainly owing that the Venetians maintained so long and brilliant a defense. After the capitulation Manin retired to Paris, where he maintained himself by giving lessons in Italian, and continued in various pamphlets and through the press to advocate the cause of Italian independence. Consult Martin, 'Daniel Manin and Venice in 1848-9.'

Ma'nioc, or Mandioc. See CASSAVA.

Man'iple, (1) one of the divisions of the ancient Roman army. It consisted of 60 rank and file, two officers called centuriones, and one standard-bearer called vexillarius. (2) In the Roman Catholic ritual a sacred vestment attached to the left arm, to leave the right at liberty for ministering.

Manipur, mān-i-poor', northeast India, a native state consisting principally of an extensive valley situated in the heart of the mountainous

MANIS — MANISTEE

country which lies between Assam, Cachar, Burma, and Chittagong; area, 8,300 square miles. The greater part of the state is covered with forest and jungle, and the wild animals include the elephant, rhinoceros, tiger, leopard, bear, deer and buffalo. The people belong to the Mongolian race. They are governed by a rajah, at whose court resides a British political agent under the control of the chief commissioner of Assam. The capital is Manipur; pop. (1901) 67,093. Most of the work is done by the Manipuri women, the men being lazy. The chief crop is rice. There is a special breed of ponies in the country, which are much employed in the game of polo, the national sport of Manipur. There has been a political agent in Manipur since 1835. In 1891, in an outbreak headed by a member of the reigning family, the chief commissioner of Assam and the political agent were murdered; but the disturbance was soon put down and avenged. Pop. (1901) 283,957. Consult Grimwood, 'Three Years in Manipur' (1891).

Ma'nis, Pangolin, or Scaly Ant-eater, an edentate mammal, belonging to the group *Squamata*, co-extensive with which is the family *Manidae*. The body and long, thick tail are covered with horny, imbricated scales. The legs are short and very strong, and the toes are armed with powerful claws, enabling the animals to burrow rapidly. These animals can roll themselves into a ball, and are then protected by their scales, and they exhibit remarkable strength in holding their bodies in this protective attitude. The scales are regarded as formed of agglutinated hairs; and in the Asiatic species true hairs grow between the scales and extend beyond them. All dwell in burrows, come abroad only at night and subsist almost altogether on ants and termites, which they capture by means of their long, rope-like, sticky tongues. They have no trace of teeth; and in general structure show a close resemblance to the American ant-eaters. The latest review of the family shows that it contains seven species, scattered through Africa and tropical Asia, all referable to the genus *Manis*. The best-known species is probably the Indian pangolin (*M. pentadactyla*), which is about two feet long. See Beddard, 'Mammalia' (1902).

Manistee, măn-is-tē', Mich., city, county-seat of Manistee County, on Lake Michigan, and the Manistee River, and on the Manistee & N. E., the Pere Marquette, Manistee & L., and Manistee & G. R. R.R.'s.

History.—Its name is derived from the river which passes through it, the Indian interpretation of which is "The Spirit of the Woods." A mission house is said to have been built here in 1826 but not until 1830 have we positive proof of the white man's presence. In 1832 a party of white men landed here and proceeded up the river. John Stronach and his son Adam chartered a schooner, and came here with machinery, supplies, and about 15 men. They arrived at the mouth of the river 16 April 1841. From that day dates the first permanent settlement of Manistee County. There were at that time about 1,000 Indians here, and soon after a reservation was set apart for them, the government allowing all the land the Chief desired.

The territory selected extended six miles north and south, and 22 miles east and west, embracing the valley of Manistee River. In 1848 a mill at the mouth of the river was built by John Canfield, and for several years thereafter, business had a tendency to settle west of what is known as "the big sandhill." In 1849 the Indian reservation was taken up by treaty, and the tribal relations of the Indians broken up, although an Indian settlement remained for many years at Eastlake, and one on the point of land projecting into Manistee Lake near the east end of River Street. In 1855 by the passage of a bill in the Legislature, Manistee County became organized, having the townships of Stronach, Brown, and Manistee, and at the first county election 136 votes were cast. In 1861 Manistee's population numbered but 1,000 persons, and between the Civil War and a disastrous fire its progress was greatly retarded. After the close of the war things became more prosperous. In 1869 the town outgrew itself and became a city, with 3,343 inhabitants. Manistee was again visited by fire, 8 Oct. 1871, and almost entirely destroyed, but with great energy the citizens began the work of reconstruction which resulted in the Manistee of to-day. Its western confines are bounded by Lake Michigan. On the southeast is Lake Manistee, 5 miles in length and $1\frac{1}{2}$ miles wide. Passing through the centre of the city, a distance of $1\frac{1}{2}$ miles, and uniting the two lakes, is Manistee River, 175 feet wide, with a minimum depth of $12\frac{1}{2}$ feet and a current running about 4 miles an hour.

Industries, etc.—With the exception of Chicago and Milwaukee, Manistee is the largest shipping port on Lake Michigan. The total number of vessels entered and cleared from this port in 1903, was 1,100 and their combined tonnage was 435,820. Of this, there were 393,806 tons of salt, and 134,382,000 feet of lumber, besides the large quantities of both that were shipped by rail. Manistee's chief industries are the manufacture of salt and lumber. Underlying here at a depth of more than 1,900 feet is a strata of rock salt 32 feet in depth, and from wells 2,000 feet deep, with an opening of but six inches in diameter, is pumped brine, from which immense quantities of salt are manufactured. Two and one half million barrels of salt are shipped from here annually. The Buckley & Douglas Salt block is the largest under one roof in the world. Four lines of passenger steamers connect the city with Chicago, Milwaukee, and points north. There are two telegraph lines, a telephone exchange, the Holly system of water-works, with 23 miles of mains, 14 miles of electric street railway, over 42 miles of streets, two daily papers, six weeklies, one of which is printed in Swedish, and one in German.

Education.—There are six modern and well-equipped school buildings beside six parish schools, a Carnegie library, 16 churches and 2 missions.

Parks.—Orchard Beach, situated $2\frac{1}{2}$ miles north of the city, is Manistee's chief beauty spot. Among the attractions of this park is a theatre 70 x 102 feet, which seats comfortably about 700 persons.

Suburbs.—Situated on Lake Manistee are Oak Hill, Filer City, Stronach, and Eastlake.

MANISTIQUE—MANITOBA

The Vacuum Pan Salt Works at Eastlake are the largest in the world, producing 3,500 barrels of salt per day. Pop. (1904) 14,260; including suburbs, 20,000.

Manistique, măn-is-těk', Mich., city, county-seat of Schoolcraft County; on Lake Michigan, at the mouth of the Manistique River, and on the Manistique & N. and the Minneapolis, St. P. and S. Ste. M. R.R.'s; about 70 miles southeast of Marquette. It is in the vicinity of the forests which furnish considerable of the marketable lumber. Iron ore and limestone are abundant in this region. The chief manufacturing establishments are foundries, lime-kilns, lumber mills, chemical works, and distilleries. Charcoal is one of the important products made just outside the city, and fishing is a prominent industry. The opportunities for trade are excellent, and Manistique is a commercial centre for a large portion of the southeastern part of the Upper Peninsula. The city has good public and parish schools and a public library established in 1894. Pop. (1890) 2,940; (1900) 4,126.

Manitoba, Canada, the central province of the Dominion, begins near lon. 95° W., on the international boundary line, and extends to 101½° W.—a distance of 276 miles. It reaches north from the boundary line for 264 miles and being in the shape of an oblong contains area of 73,732 miles. The water surface contained in its inland fresh water lakes is computed at 9,890 square miles. Pop. (1871) 25,228; (1881) 62,260; (1891) 152,506; (1901) 255,211. The capital is the city of Winnipeg, lying almost equally distant from the Atlantic and Pacific oceans. The city (1901) contained a population of 42,340, by the civic census (1904) 67,000. Other centres are, (1) the city of Brandon (1901) pop. 5,620; (2) the town of Portage La Prairie (1901) pop. 3,901. The province lies at a varying elevation of from 760 to 1,500 feet above the sea.

Topography and Geology (including soils).—The eastern part of Manitoba consists of Laurentian rocks, bare of soil, the region having been the source of supply, when worn down by glacial action, of the deposits to the west. This Archæan region stretches for seventy or eighty miles from the eastern boundary, where begins the terrane of the Red River and Assiniboine valleys, varying from 60 to 170 miles in width. The valley region is underlain by limestone deposits of the Silurian and Devonian period. On the west side of this valley extends at an elevation of from 100 to 150 feet the second prairie steppe, the eastern escarpment of which is the Pembina Mountain, Tiger Hills, Riding Mountain, and Duck Mountain. Underlying this elevated plane the rocks, largely of shale and sandstone, are of the Cretaceous period. The rocks of Manitoba contain deposits of iron, gypsum, cement, limestone for building. The Silurian, Devonian and Cretaceous rocks of Manitoba are overtopped by beds of drift or soil from 60 to 200 feet in thickness. This drift had been chiefly deposited in a series of lakes formed by the great melting ice-lobes of the glacial period. In these post-glacial lakes—Agassiz, Souris, and Saskatchewan—the drift beginning at the underlying rock is generally made up of boulders, boulder clay, blue clay, a layer of marly clay called

“white mud” and on the surface a rich deposit of humus from two to four feet thick. This upper layer being well supplied with phosphates and nitrogenous components is probably the most fertile soil in North America. Manitoba is well watered by Lakes Winnipeg, Manitoba, Dauphin and Winnipegosis, and by the Red River, Assiniboine and Winnipeg, their affluents. Along the lakes and rivers, and in protected elevations, considerable areas of trees grow. These are chiefly cedar, spruce, tamarack, aspen (poplar), balsam, cottonwood, elm and oak. Indigenous fruits are the strawberry, raspberry, plum, cherry, high bush cranberry, huckleberry and wild grape. The rivers and lakes teem with fish—white fish (largely exported), cat fish, gold eyes, pike, pickerel and sturgeon. The wild life of the region is made up of moose, jumping deer, antelope, Arctic hare, rabbit, fox, prairie wolf, prairie chicken, partridge, swan, pelican, wild goose, duck, crane, snipe, and a great variety of carnivorous and insectivorous birds. The province is in consequence a famous resort of hunters. Buffalo, once numerous, are now extinct.

Climate.—The climate in winter is cold, but dry, and though the mercury occasionally falls to 40° below zero, yet it is a pleasant winter climate. Being of a comparatively low level there are few violent storms, and the country is most healthful. The summer months are warm, the days are long, having in midsummer 18 hours of sunshine, the temperature rises at times, but there is almost continuously a slight breeze, and the nights are always cool.

Pioneer History and Development.—Prior to the efforts made by the Earl of Selkirk in the ten years following 1811 Manitoba had practically no history apart from the fur-hunting, Indian trading, records of the Hudson's Bay Company with its administration, from 1670 onwards, of regions stretching from the shores of Lake Superior to the waters of the Pacific and far into the wilds of Alaska. Up to that time Manitoba had no separate identity and was merely a part of the great and ill-defined territory known as Rupert's Land.

After studying the position of affairs in the Northwest and in Montreal Lord Selkirk made up his mind that the Hudson's Bay Company were the eventual masters of the situation and decided to throw in his lot with them. He purchased, in 1811, a controlling interest in its stock—some £40,000 out of £100,000—and obtained from the directors, amongst whom were many of his friends or relatives, a grant of 116,000 square miles of territory on the condition that he would establish a colony and furnish the company with laborers as required. This was practically the founding of the province of Manitoba. The pioneer nobleman at once brought out a ship-load of the Duchess of Sutherland's tenants and after varied difficulties and dangers reached the junction of the Red and Assiniboine rivers where, near the site of the present city of Winnipeg, the Red River settlement was established. The Nor'-Westers, a rival company to that of Hudson's Bay, claimed this land and every means of annoyance in the power of a strong corporation was freely used, as occasion arose, to injure the settlement. Finally, in 1816, the dispute

culminated in a skirmish in which Governor Semple, who was acting for Lord Selkirk, and a number of his colonists, were killed by an armed band of Nor'-Westers.

It was a typical incident, though an unusually violent one, of the conflict which was waged all over the Northwest during the first twenty years of the 19th century between these two great companies. In this case, however, it aroused the lion that was in Lord Selkirk and, though just recovering from illness, he obtained a force of 80 soldiers and a couple of small cannon. With this troop he rushed around the Great Lakes from Montreal, and through the wilderness, captured the chief agent and several partners of the Northwest Company, and sent them to York, in Upper Canada, for trial upon various charges of murder, arson and robbery. They could not well be convicted at such a distance from the scene and under the irregular conditions of their arrest, but the lesson was a good one and for the next few years, until the Hudson's Bay Company absorbed its rival in 1821, there was more of peace and quietness in the vast region of their rivalry.

As the years passed the settlement grew in size and importance and Fort Garry, founded in 1835, became the headquarters of the Hudson's Bay Company. The latter, in 1836, purchased for £84,000 the land granted to Lord Selkirk in 1811. Gradually the population was added to by French trappers and hunters and by half-breeds who came from the unions of the French with Indian women and, in time, constituted a population of thousands. Sir George Simpson assumed control of much of the company's affairs after its absorption of the Nor'-Westers and from 1821, for 35 years, he was the leading spirit of the Northwest. He organized the interests of the company, explored and extended its vast territories, reconciled conflicting conditions and established a vigorous personal control. A network of trading posts was constructed across the continent and, when the governor retired in 1856, the Hudson's Bay Company, with 152 regular establishments and over 3,000 permanent servants, dominated the religious, political and social life of the Northwest.

Projected Union with Canada.—Sir Edmund W. Head, lately governor-general of British America, was then governor of the company, and in favor of a complete sale of rights and ownership to the United Provinces of Canada—now the provinces of Ontario and Quebec. Various negotiations followed between the British and Canadian and Company authorities, including a fruitless mission to London in 1865 by the Hon. George Brown, and finally, on 14 Dec. 1857, after the confederation of the old provinces into a dominion had taken place, the Hon. William McDougall introduced in the new House of Commons a series of resolutions upon the subject. They declared that the Dominion of Canada should be extended to the shores of the Pacific; that the colonization of the Northwest, the development of its mineral resources, and the extension of trade within its bounds were alike dependent upon a stable government; and that the welfare of its sparse population would be promoted by the

extension of Canadian government and institutions over the entire region. In the following year Mr. McDougall and Sir George Cartier went to England to settle terms of acquisition and, in 1869, the arrangements were finally consummated between the governments concerned.

Canada claimed the whole region as of right; it now accepted the territory upon the condition of paying £300,000 sterling to the company. It granted at the same time to the company a twentieth part of all lands surveyed for settlement in what was called Rupert's Land, and gave certain guarantees against undue taxation. The company, on its side, retained possession of its historic trading-posts and maintained its influence with the natives and its special facilities for the fur-trade. Though the trading monopoly was lost, and the progress of settlement and railways in time changed the nature of much of its business, the Hudson's Bay Company continued to be, and is to-day, a great power in the commerce and upbuilding of the Northwest.

Provincial Institutions and Government.—The affairs of Manitoba are directed by a lieutenant-governor, appointed for a term of five years by the Canadian governor-general-in-council, with an executive of five ministers of the crown, and a legislative assembly consisting of 40 members, who are chosen every four years by popular vote, unless the house is dissolved before that time elapses under the crown's prerogative as expressed by the lieutenant-governor. The province is represented in the Dominion Parliament by four senators appointed for life by the governor-general-in-council; and by ten members in the House of Commons, elected by popular vote. The judiciary consists of a chief justice, four judges of the court of king's bench and five county judges.

The development of these institutions, however, took time. The first event in the history of Manitoba as a province was the purchase in 1869 by Canada of Rupert's Land from the Hudson's Bay Company for \$300,000; the consequent suspicion and easily aroused fears of the ignorant half-breed population; the action of Louis Riel—a clever and unscrupulous half-breed—in playing upon their feelings and gradually stirring them into the rebellion stage; the driving over the frontier of the governor sent from Ottawa; the subsequent period of "provisional" government at Fort Garry under Riel; the murder of young Scott by his orders and the arousing of Ontario; the despatch of an expedition under Colonel Wolseley early in 1870; the entry into Fort Garry and flight of Riel and his associates to the other side of the line. Arrangements were then proceeded with for the reconstruction of affairs and Canada's position clearly placed before the people.

The Canadian government's policy—which might have averted the insurrection had it been properly placed before all the people of the settlement at an earlier period—included the declaration that civil and religious liberties and the privileges of the whole population would be sacredly preserved; that properties, rights and equities, as enjoyed under the company's rule, would be maintained; that a liberal system in the granting of titles to land now occupied by

settlers would be pursued; that all classes of the residents would be fully and fairly represented in the government; that municipal self-government would be at once established and the country ruled by a constitution based upon British laws and precedents and practices. On 15 July 1870 the province was duly constituted by royal and parliamentary enactment with Mr. (afterwards Sir) Adams G. Archibald as its first lieutenant-governor. An executive council of not less than five persons was to be appointed, with a legislative council of seven members which was to be increased to 12 after four years and a legislative assembly of 24 members, elected to represent certain electoral districts as constituted by the lieutenant-governor. The duration of the legislature and its functions were to be controlled by the same provisions as applied in the British North America act to the other provinces. Either the French or English language—a privilege afterwards abolished so far as French was concerned—could be used in debates and official records. The legislative council was abolished in 1876 and the number of members in the assembly was afterwards raised to 40. The first organized ministry in the infant province was constituted on 16 Sept. 1870 with the Hon. Alfred Boyd as premier.

Progress and Politics of the People.—The story of Manitoba's early progress is one of steady growth. The slow development of the little town of Winnipeg, which took the place of Fort Garry, was greatly changed by the promised appearance of the Canadian Pacific Railway. It rose rapidly into a city of many thousands, while the steady accretion of farmers in the vast and fertile prairies stretching away toward the distant horizon helped to develop the phenomenal "boom," typical in its inception and progress of all western periods of expansion, which came to Manitoba in 1879 and 1880, and merged the solid investments of thousands of Ontario business men in fantastic land schemes and non-existent prairie villages of which surveys had not even been made. The inevitable reaction followed, but after that came a slow, but steady and substantial progress which, latterly, is becoming a rapid development.

For many years local politics were of a purely parish nature, and government consisted in legislating for schools, scattered over a large area amongst isolated settlers, providing the beginnings of municipal life, practising the forms of constitutionalism and guarding the interests of the small, though growing population of farmers. Alfred Boyd, 1870; M. A. Girard, 1871; H. J. H. Clarke, 1872; M. A. Girard, 1874; R. A. Davis, 1874; John Norquay, 1878; D. H. Harrison, 1887; Thomas Greenway, 1888; H. J. Macdonald, 1899; and R. P. Roblin, 1900; succeeded each other as prime ministers. With the Canadian Pacific in the early eighties came development and also questions of monopoly, of the right to establish competitive lines, of the necessity of competition and control of rates, of the location of branch lines and all the complications incident to a time of public expansion and the sudden growth of transportation interests. These problems have all been settled, or are now settling themselves, in one form or another. There has, at times, been

friction between the provincial government and the Dominion authorities, but never violent trouble; except in the brief and passing matter of the Red River Railway effort to cross the tracks of the Canadian Pacific Railway. The Manitoba school question is dealt with elsewhere.

Education.—The school system established by law is undenominational, religious instruction being permitted, should the parent not object. The Dominion government has set apart two sections of land of one square mile each in every surveyed township, for the support of public school education. As fast as settlement progresses, schools are established, and as teachers have to pass a rigid examination before they are appointed, the education of the children is generally of a high class.

At the head of the educational system of the province stands the University of Manitoba (supported by a land grant of 150,000 acres), an examining and degree conferring body, as well as a teaching body in science, affiliated to which are the Episcopal, Presbyterian, Methodist and Roman Catholic colleges; as also the Medical and Pharmacy colleges. Collegiate institutes for higher education are connected with the public school system in Winnipeg, Brandon, and Portage La Prairie. There is also a normal school for the training of teachers in Winnipeg. In 1904 the province had 1,669 schools, 2,218 teachers, 58,547 pupils and an average school attendance of 31,326.

Religion.—The Presbyterian church is the strongest in the province, including in 1901, 65,348 persons. The Methodist church comes next with 49,936. The Church of England has 44,922; the Roman Catholic 35,672; Lutheran, 16,542; Baptist, 9,166; and other denominations aggregate 33,625.

Agriculture and Stockraising.—Wheat, oats, barley, Indian corn, hops and flax grow well. For wheat growing Manitoba presents peculiar advantages, and the principle is here illustrated that the best specimen of a cereal is found along the line of its farthest north development. When compared with the best wheat-growing districts of the United States, the soil of Manitoba is found to produce on an average a greater weight to the bushel. Thirty bushels to the acre is a common crop in Manitoba; while in Southern Minnesota it is 20 bushels, in Pennsylvania and Ohio 15, and in Wisconsin only 14; and while spring wheat (the usual crop) in Manitoba weighs from 63 to 66 pounds to the bushel, that of Minnesota weighs only from 60 to 65 pounds. As to quality also the Manitoba wheat excels; it possesses a large quantity of gluten and sells at ten cents a bushel more than eastern wheat. Potatoes and all other root crops thrive well, while garden vegetables grow with wonderful exuberance. For hay the native prairie grasses in the moist meadows are still largely used, though timothy, which grows freely, is now being considerably cultivated. Cattle.—Shorthorns, Ayrshires, and Galloways—are now largely introduced; stockraising is an established industry. Cheese and butter-making in scientifically managed creameries and factories is followed throughout the province. In western Manitoba wheat growing is, however, the favorite occupation.

MANITOBA — MANITOBA SCHOOL QUESTION

According to the census of 1901 and other official figures the value of Manitoba's agricultural interests, investments and products was as follows:

Lands	\$93,233,535
Buildings	20,049,726
Implements and machinery	12,169,619
Horses	15,763,463
Milk cows	4,754,974
Other horned cattle	3,944,406
Sheep	144,018
Swine	871,627
Poultry	417,586
Bees	6,127
Field crops	16,669,321
Fruits and vegetables	163,958
Nursery stock sold	7,152
Live stock sold	2,869,105
Meats and products of all animals killed on the farm	1,325,289
Dairy products	2,792,606
Wool	15,272
Eggs	605,534
Fisheries	342,990
Forest and furs	966,702
Manufactures	15,749,805

Transportation and Financial Conditions.—

The chief event of late years has been the coming of the Canadian Northern Railway, its construction from Port Arthur to Winnipeg (1902), its construction through the province and building of various branch lines. The provincial government also obtained control of the Northern Pacific Railway and its branch lines in Manitoba and have pursued a useful policy in both cases of checking and lowering rates from time to time. The present Roblin administration has recently (1906) taken action along the lines of provincial acquisition of the telephone service. The grain crop of the province in 1903, including wheat, oats and barley was 82,576,519 bushels; in 1904, 87,302,736 bushels; and the figures for 1905 are somewhat in excess of the preceding year. The provincial indebtedness in 1904 was \$20,684,727, with assets stated at \$20,102,909; its revenue was \$1,486,667 and expenditure \$1,271,732.

J. CASTELL HOPKINS,

Author 'Canadian Annual Review of Public Affairs.'

Manitoba, Canada, a lake situated in Manitoba province, to which it gives its name, about 59 miles southwest of Lake Winnipeg. It is of irregular shape, 119 miles long, with a maximum breadth of 29 miles, a shore-line of 535 miles, an area of 1,171 square miles, and an average depth of 12 feet. It is 810 feet above sea-level, and 40 feet higher than Lake Winnipeg, into which it drains through the Saskatchewan or Dauphin River. The name is a contraction of two Cree words, *Manito-waban*, meaning "the spirit's strait," and was originally applied on account of a peculiar agitation of the waters of a strait in the lake. The first European to visit the lake was the Chevalier de la Verendrye in 1739.

Manitoba School Question. In 1871, shortly after becoming a Province of the Dominion a law was passed by the Manitoba Legislature which established a system of denominational education in what were then called the common schools. By this Act 12 electoral divisions comprising in the main a Protestant population, were to be considered as constituting 12 Protestant school districts under the management of the

Protestant Section of the Board of Education. Similarly 12 districts, made up chiefly of a Roman Catholic population, were constituted an equal number of Catholic school districts, and were placed under the control of the Catholic section of the Provincial Board of Education. Each school division raised the contribution required, in addition to the amount given from the public funds, as might be decided at its annual meeting. And, without the special sanction of its Section of the Board of Education, only one school could be established in each district. Changes suited to the differing proportions of the population were made in 1875; but the general principle was still maintained. The system cannot be said to have worked badly or to have caused any serious trouble between the religious divisions of the Province.

Abolition of the Separate Schools.—In 1890 sectarian feeling was aroused by the eastern agitation over the Jesuits' Estates affair and showed itself in a local movement against Separate Schools. The Premier, Mr. Thomas Greenway, with his lieutenant, Attorney-General Joseph Martin, seized the favorable and popular moment to establish a common school system. By the Act then passed, all school taxes, whether derived from Protestants or Catholics, were appropriated to the support of the new public schools and the old arrangement constituting two Boards of Education was, of course, abolished. Needless to say, the Roman Catholics all over the Dominion were seriously aroused by this action. It seemed to threaten their rights everywhere as well as those they claimed in Manitoba.

Strenuous pressure was brought to bear upon the Dominion Government to disallow the Act as infringing the rights of the minority. A petition dated 6 March 1891, and signed by the Roman Catholic Archbishops and Bishops of the Dominion was presented, stating that both the Schools' Act and the one abolishing the dual language system in Manitoba were "contrary to the dearest interests" of a large portion of the loyal subjects of Her Majesty; contrary to "the assurance given during the negotiations" which determined the entry of the Province into Confederation; contrary to the terms of the British North America Act and of the Manitoba Act; contrary to the principles of public good faith. A little later, on 4 April, the French press of Quebec, published a pastoral letter, issued by Cardinal Taschereau and the hierarchy of the Province, which was read in all the Catholic Churches and claimed that the legislation in question would "despoil the Church of its sacred rights." It urged once more "the control of the Church over the education of Catholic children in the schools," and called upon all Catholics "to pray and to work for justice."

The Question in the Courts.—Following, however, the precedent set in the Jesuits' Estates Case, the Manitoba Schools' Bill was allowed by the Federal Government to go into operation. The Government, however, intimated its willingness to pay the expenses involved in testing the constitutionality of the measure. Meantime, appeal had been entered by Mr. J. K. Barrett of Winnipeg, in the interest of the local Catholic ratepayers and against two city by-laws which imposed a rate of taxation upon Catholics and Protestants, alike, for

MANITOBA SCHOOL QUESTION

the support of the public schools. He claimed that the old law was still in force, and based his case upon the 22d section of the Manitoba Act, under which the Province entered the Union, and which stated that "nothing in any such law (Provincial) shall prejudicially affect any right or privilege, with respect to denominational schools, which any class of persons may have by law or practice in the Province at the Union."

The Manitoba Government maintained, as against this plea that a Separate School system was not really in existence prior to the Province entering the Confederation and that, consequently, the Roman Catholic minority possessed no guarantee whatever. On 2 Feb. 1891 the Court of Queen's Bench in Manitoba sustained the validity of the Act, three Judges being favorable and one opposed. The case was at once appealed to the Supreme Court of Canada. Towards the end of October judgment was unanimously given by the latter body declaring the Act *ultra vires*, allowing the appeals, and quashing the city by-laws. The local Government then announced its intention of appealing the case to the Judicial Committee of the Imperial Privy Council. Late in July, 1892, the decision of the highest British Court of Appeal upheld the Manitoba Courts, declared the legality of the Act of 1890 and reversed the judgment of the Supreme Court of the Dominion.

The Law Affecting Federal Intervention.—The Catholic minority then fell back upon sub-section 2 of Section 22 of the Manitoba Act which, it was claimed, provided for an appeal to the Governor-General-in-Council from any act or decision of the Legislature of the Province, or of any Provincial authority, affecting any right or privilege of the Protestant or Roman Catholic minority of the Queen's subjects in relation to education. Their appeal was sent to the Dominion Government by way of petition on 26 Nov. 1892. They admitted that no rights or privileges had been acquired previous to the Union, but pointed out that the second sub-section was wider in its terms than the first and provided for an appeal to the Governor-General-in-Council against the legislation affecting rights acquired at any time, including rights or privileges conferred at the Union. They contended that the Act passed by the Manitoba Legislature in 1871, and amending Acts, established a system of Separate Schools and conferred rights and privileges which were taken away by the Act of 1880. They asked for an Order-in-Council restoring Separate School rights.

Before entertaining the appeal asked for by the minority, the Governor-General-in-Council decided to ask the Courts if the appeal was one which could be heard under the terms of sub-section 2 of Section 22 of the Manitoba Act. On 20 Feb. 1894, the Supreme Court of Canada held that no appeal lay and that the Governor-General-in-Council had not the power to make the order asked for. On 29 Jan. 1895, the Judicial Committee of the Privy Council reversed the judgment of the Supreme Court. They decided that the Governor-General-in-Council had power to hear the appeal, inasmuch as the Acts of 1890 affected rights or privileges of the Roman Catholic minority in relation to education within the meaning of sub-section 2 of Sec-

tion 22 of the Manitoba Act. The Court was not asked to determine what particular rights or privileges of the minority had been affected, and purposely refrained from doing so. It was intimated, however, that it was certainly not essential that the statutes repealed by the Act of 1890 should be re-enacted. The "system of education embodied in the Acts of 1890," the judgment stated, "no doubt commends itself to and adequately supplies the wants of the great majority of the inhabitants of the Province." If this system were supplemented by suitable provisions for the minority all ground of complaint would be removed.

Issue of the Remedial Order. After the decision of the Judicial Committee was given the Governor-General-in-Council, or in other words the Thompson Government, proceeded to hear the appeal, on 26 February and the early days of March. The result of their deliberations was the passage of the Remedial Order of 19 March 1895. By this Order the Dominion Government required the Province of Manitoba to restore to the minority the following alleged rights:

(1) The right to build, maintain, equip, manage, conduct and support Roman Catholic schools in the manner provided by the said statutes which were repealed by the two Acts of 1890 aforesaid.

(2) The right to share proportionately in any grant made out of the public funds for the purpose of education.

(3) The right of exemption of such Roman Catholics as contribute to Roman Catholic schools from all payment or contribution to the support of any other schools.

Manitoba's answer to this demand was submitted to the Provincial Legislature on 13 June 1895, and adopted on the 19th day of the same month. It was pointed out that the Remedial Order demanded the restoration of the old school laws which had been inefficient; that the policy of 1890 had been adopted after a careful examination of the system previously prevailing; that under the old system, many people had grown up in a state of illiteracy; that apart from the objections to separate schools on principle, the weight of school taxation and the sparseness of settlement in Manitoba made it impossible to carry on a double system of schools. It was urged also that the Ottawa authorities had demanded the restoration of the old system without obtaining full and accurate information as to its working and the Province expressed its willingness to co-operate with the Dominion Government in making a thorough investigation of the whole subject. Legal difficulties were referred to, hasty action was deprecated and a strong appeal was made to the Dominion Government to exercise the greatest care and deliberation in dealing with a question of such vast importance and affecting the religious feelings and convictions of different classes of the people of Canada as well as the educational interests of the Province of Manitoba.

Upon receipt of the Manitoba Government's reply the Dominion Government, after a short delay, announced itself as being committed to the policy of remedying the alleged wrongs of the Roman Catholics. The announcement was made in Parliament that the Manitoba Govern-

MANITOBA, UNIVERSITY OF

ment would again be requested to act and that in the event of a refusal on the part of the Province the Dominion Government would call Parliament in January 1896, and introduce legislation to enforce compliance with the Catholic demands. The controversy was further embittered by those political considerations which occasionally arise when a Liberal Provincial Government is in opposition to the policy of a Conservative Dominion Government or *vice versa*. The complications became still greater in this case when the Protestant sentiment of the Manitoba majority and of the Ontario Orangemen was found in open conflict with an aggressive Roman Catholic sentiment in Quebec which pressed upon the Dominion Government the demands of their co-religionists in Manitoba. The Session of 1896 was duly held, and Sir Charles Tupper introduced his Government's Remedial legislation. But he could not carry it through the diverse sectarian elements of the House and was beaten in the immediately succeeding general elections. The new Liberal Premier, Sir Wilfred Laurier, had then little apparent difficulty in compromising and settling the issue with the Liberal Premier of Manitoba. The arrangement effected in 1897 may be summarized as follows:

(1) Religious teaching to be permitted in schools if authorized by Resolution of the majority of the Trustees of the district, or if asked for by petition of the parents or guardians of at least 10 children attending a rural school or 25 attending an urban school.

(2) Such religious teaching to take place between the hours of 3:30 and 4 P.M. and to be conducted by any Christian clergyman of the district or person duly authorized by him.

(3) In any rural school where the attendance of Roman Catholic children is 25 or upwards, and in urban schools where it is 40 and upwards, the Trustees may, upon petition, employ at least one duly certified Roman Catholic teacher.

J. CASTELL HOPKINS,
Editor of 'The Canadian Annual Review of Public Affairs.'

Manitoba, University of. The Canadian province of Manitoba, which was formed out of Rupert's Land in 1870, was the outgrowth of the Red River Settlement founded by Lord Selkirk and his immigrants under Hudson's Bay Company auspices in 1812-15. The Scottish settlers were joined from time to time by the Metis, the descendants of French-Canadian voyageurs, who married Indian women, and also by the children of company officers and Orkney employees of the Hudson's Bay Company who had taken Indian wives. This mixed community in 1870 numbered 12,000 souls.

To the Metis came from Lower Canada Priest (afterward Bishop) Provencher, who in 1818 established a school, which grew in later times into Saint Boniface Roman Catholic College. The English-speaking half-breeds belonging to the Church of England were educated at Saint John's College, which was reorganized in 1866 by Bishop (afterward Archbishop) Machray. Just as the new province of Manitoba was forming there was established in 1871, by the writer, in Kildonan, near Winnipeg, among the Selkirk Scottish settlers, a Pres-

byterian college, known since as Manitoba College. This last-named college was in 1874 removed to Winnipeg. These three denominational colleges were all in or near the new city. In 1875 an important meeting was held in the court-house, Winnipeg, by Manitoba College, in which a union of the three colleges under a provincial university was suggested. Governor Morris favored this plan, and in 1877 an act was passed in the legislature of Manitoba establishing the University of Manitoba, to which the three colleges, Saint Boniface, Saint John's, and Manitoba were affiliated. The University was at first to be only an examining body, the teaching being done entirely by the colleges.

The new University was unique. It brought together the largest religious bodies of the province, and kept up the standard of education, it being the only source of degrees. Its first examinations took place in May 1878, when seven candidates presented themselves. In 1878 application was made to the Dominion government for a land grant, and at length, in 1885, under the "Better Terms Settlement" of that year, 150,000 acres of good agricultural wild land was given to the University. This endowment is now valued at \$1,250,000. In 1883 a native of Red River Settlement living in England, Mr. A. K. Isbister, who like many others, was attracted by the broad and cosmopolitan spirit of the young university, bequeathed \$83,000 as a scholarship fund to the University. This fund has proved a great boon to the students, as from it upward of \$3,000 is given annually in scholarships.

In 1882 the Manitoba Medical College was founded and became affiliated to the University. In 1888 a new member of the sisterhood of Arts Colleges—Wesley College of the Methodist Church—was affiliated to the University; a College of Pharmacy was affiliated in 1902. A Baptist college in Brandon, the second city of the Province, though not affiliated, yet sends its students up to the University examinations.

The affiliated colleges have a representation of seven members each on the University council; the graduates of the University, now numbering upward of 400, have ten representatives, and the Provincial Government appoints seven. The University council thus consists of about 50 members. It has a chancellor appointed by the Provincial Government, and a vice-chancellor chosen by the council. The lieutenant-governor of Manitoba is Visitor. The executive of the council is a representative body of 13 members, and is called the "Board of Studies."

In 1893 the university act was changed to allow teaching to be done by the University in natural science, mathematics, and modern languages, the arts colleges taking up the other departments. In 1898 a site of seven acres in the heart of Winnipeg, valued at \$120,000, was given by the Dominion Government to the University, and in 1900 the first building was erected. Teaching in natural science was begun in 1900, and in 1904 six professors in natural science and mathematics were appointed. There is also a large amount of intercollegiate teaching. Degrees are given by the University in arts, law, and medicine, and the several denominational colleges have the power to bestow degrees in theology on students who have passed a certain

arts requirement in the University. These degrees on being reported become *ipso facto* degrees of the University.

Thus the two systems of university education—national and denominational—are combined, and the advantages of both obtained. The denominational colleges have their residences and grounds; and exercise discipline and social control over their students, while the provincial university conducts the examinations, confers degrees, and has taken over science teaching, the most expensive department of education. It may take other subjects in the future.

The University is supported by the revenue from the lands, a Provincial Government grant, fees of students and candidates, and by private benefactions—Lord Strathcona giving it for immediate purposes \$20,000. In 1904 the University examined 812 candidates.

The arts curriculum is a blending of a fixed course, with certain options in the first and second years, and then specializing is allowed in the third and fourth years in one of the departments of classics, mathematics, modern languages, philosophy, natural science, or a general course.

The University building accommodates the department of science, which is generally being well equipped for its work. A library has been begun, but is still in its infancy. The several affiliated colleges have large libraries, and the students have access to the Provincial Library and the new Carnegie Library of the city.

As the University of Manitoba is the only university in Canada west of Lake Superior, it cultivates the whole region of Manitoba, new Ontario, the Northwest Territories, and British Columbia. It holds local examinations at several points in Manitoba, as well as Regina, Calgary, and Edmonton in the Territories, and at Vancouver, Kamloops, and Victoria in British Columbia. On account of the vast territory served, and of its having no rival in western Canada, Manitoba University, should no change take place in its prospects, bids fair to be in 25 years the largest university in Canada.

GEORGE BRYCE, D.D., LL.D.,

Member of Board of Studies University of Manitoba.

Manitou, măn'ī-too, a name given, among the American Indian tribes, to any spirit, good or evil; also applied to any object of religious awe and reverence. "The Illinois," wrote the Jesuit Marest, "adore a sort of genius, which they call manitou; to them it is the master of life, the spirit that rules all things. A bird, a buffalo, a bear, a feather, a skin—that is their manitou." "If the Indian word manitou," says Palfrey, "appeared to denote something above or beside the common aspects and agencies of nature, it might be natural, but it would be rash and misleading to confound its import with the Christian, Mohammedan, Jewish, Egyptian, or Greek conception of Deity, or with any compound of a selection from some or all of those ideas." The word was applied to any object used as a fetish or an amulet. It was common among all western and Mississippi tribes.

Manitou, Colo., town, in El Paso County; on the Denver & R. G. and the Colorado M. R.R.'s; about seven miles northwest of Colorado Springs. It is situated in a region renowned for

the beauty and grandeur of its scenery, and at an altitude of about 6,330 feet above sea-level. It is in three cañons—William's Cañon, Ute Pass, and Engleman's Cañon. Nearby are Pike's Peak and the Garden of the Gods. The medicinal springs, six in number, are visited annually by a large number of health seekers. The wonderful cave or series of caves, which were discovered by George W. Snider in 1881, have been explored for quite a distance. One of the remarkable features of this remarkable underground natural curiosity is the Guadalupe Dome and the Pipe Organ. The group of stalactites which have been named the Pipe Organ give forth the complete musical scale, in sweet, clear notes. Numerous waterfalls are in the vicinity of Manitou, also Monument Park, which like the Garden of the Gods, has many peculiar formations of red and white limestone. The Pike's Peak cog railway terminates at Manitou. A large number of tourists visit the town annually, especially in the summer season. The population in July and August is said to be about five or six times greater than in winter. Pop. (1900) 1,303.

Manitoulin, (măn-ī-too'lin) Islands, Canada, a group of islands in the northeastern part of Lake Huron, which separates the waters of the Lake from Georgian Bay. The name is a corruption of the Indian word Manitowin, which means divinity. Except Drummond Isle, about 25 miles long and 9 miles wide, which belongs to the State of Michigan, the group is a part of the province of Ontario. The largest island of the group is Grand Manitoulin, or Sacred Isle; about 87 miles long and averaging 22 miles wide. Cockburn, or Little Manitoulin, is nearly circular, and about eight miles in diameter. The coast is very irregular, and all are well wooded; Grand Manitoulin and Cockburn have large pine forests. The shore waters abound in fish. Fully half the inhabitants are Indians of the Algonquin race. The cool climate in summer and the striking natural features add to the attractions of the islands and make them a favorite summer resort. Pop. 2,000.

Manitowoc, măn-ī-tō-wōk', Wis., city and county-seat of Manitowoc County; on Lake Michigan, at the mouth of the Manitowoc River, and on the Wisconsin C. and the Chicago & N. W. R. R.'s; about 112 miles northeast of Madison and 77 miles north of Milwaukee. The city, picturesquely surrounded by a semicircle of low hills, was chartered in 1870. It has a good harbor, and regular steamer connection with all of the important lake ports; large grain elevators, ship-building and repair yards, and an extensive export trade in wheat and other grain, lumber, leather, beer, dairy products, etc., and imports of groceries, cloth, and clothing. The manufactures are important, the census of 1900 returning 185 establishments, with \$2,581,869 capital stock, employing 1,230 persons at \$506,943 annual wages, using materials valued at \$1,018,440, and with a product valued annually at \$2,268,348. There are three large breweries; the other industries were brick-yards, hay presses, creameries and cheese-factories, saw- and planing-mills, and manufacturing of leather, flour, furniture, foundry products, machinery, agricultural implements, edge tools, cigars, canned goods, and glue. The

MANIZALES — MANLY

city has national, savings, and other banks, waterworks, gas and electric light; and daily and weekly newspapers, several of which are published in the German language. Manitowoc is the seat of the county asylum, St. Mary's Hospital, St. Felix Industrial and Reform School, Holy Family Hospital, and the James Library, and has a courthouse, a high school, public and parochial schools, and several handsome churches. Pop. (1890) 7,710; (1900) 11,786.

Manizales, mǎ-nē-sǎ-lās, Colombia, town, in the southern part of the department of Antioquia; about 95 miles northwest of Bogota. The altitude is about 7,000 feet. It was founded in 1848 and its situation at the junction of the main passes over the mountains, and near valuable gold mines has contributed to its rapid growth. In the valleys, in the vicinity, stock-raising is an important industry. It has fine churches and schools, a good library and a number of comfortable homes. During the civil war of 1877-8 the town was the headquarters of the rebels. The climate is not severe, although in a high altitude, as higher mountains in the vicinity are a protection. Pop. about 20,000.

Mankato, mǎn-kǎ-tō, Minn., city, county-seat of Blue Earth County; on the Minnesota River at the mouth of the Blue Earth River, and on the Chicago, M. & St. P., the Chicago G. W., the Chicago & N. W., and the Chicago, St. P., M. & O. R.R.'s; about 88 miles southwest of Saint Paul. It is situated in an agricultural and timber region, and in the vicinity are valuable stone quarries. Its chief manufactures are knit goods, lime, cement, beer, butter, candy, flour, lumber, foundry and machine-shop products. There are in manufacturing business about 3,000 employees. The principal buildings are State Normal School, a government building, a Carnegie public library, Saint Joseph's and Tourtellotte hospitals. The city has 20 churches, good public and parish schools, a commercial college, and the State school, which has been mentioned. There are four banks with a combined capital of \$350,000. The business amounts to about \$4,000,000 annually.

The city was first settled in 1852 by eastern people. It was incorporated 15 July 1858, and chartered as a city 6 March 1868. The present government, according to a charter of 1891, is vested in a mayor and in a council composed of six members. Mankato was the scene of several battles during the Sioux Indian War 1862-3. In 1863, 38 Indians were hung for murder. Pop. (1890) 8,838; (1900) 10,599; (1903) 12,000.

J. E. REYNOLDS,
Editor 'Daily Free Press.'

Manley, mǎn'li, John, American naval commander: b. 1734; d. Boston 1793. At the outbreak of the Revolutionary War he had command of the armed schooner Lee, with which he cruised along the coast of Massachusetts Bay, making captures of great value to the American army then investing Boston. In July 1778, his ship, the Hancock, was captured by a British frigate and after a rigorous confinement in Halifax, he was exchanged, and in 1782 was put in command of the Hague frigate, which, after lying in a perilous position on a sand bank off

Guadeloupe for three days, exposed to the fire of four British ships of the line, contrived to effect her escape. This exploit closed the regular maritime operations of the United States during the Revolutionary War.

Manley, Joseph Homan, American journalist and politician: b. Bangor, Maine, 13 Oct. 1842; d. Augusta, Maine, 7 Feb. 1905. He graduated from the Little Blue Abbott Academy at Farmington, Maine, in 1858 and in 1862, at the age of 21, from the Albany Law School. He was admitted to the bar in 1865, being appointed a commissioner of the United States district court, serving one year. In 1866 he was president of the city council of Augusta and in 1881 was appointed postmaster of Augusta by President Garfield, which office he held for seven years. Acquiring a half interest in the 'Maine Farmer' he joined hands with James G. Blaine in aggressive local and national politics, dictating the editorial policy of that paper for three years. He was a delegate to the Republican National conventions of 1880 and 1888, was for many years chairman of the Maine Republican State committee and a member of the Republican National committee and was a notable figure in the executive committees of 1896 and 1900, which aided in the election of McKinley.

Manley, Mary de La Rivière, English author: b. in the island of Guernsey about 1672; d. London 11 July 1724. She succeeded Swift as editor of the 'Examiner' in 1711. She is known for her 'Secret Memoirs and Manners of Several Persons of Quality of Both Sexes: from the New Atlantis' (1709), a licentious satire that caused the arrest of both the author and the publisher, though they were subsequently discharged. This work was continued in the 'Memoirs of Europe' (1710). She also published 'Letters Written by Mrs. Manley' (1696); 'The Secret History of Queen Zarah and the Zarazians' (1705); 'The Adventures of Revella' (1714); 'The Power of Love: in Seven Novels' (1720); and other unimportant books.

Manley, Thomas Henry, American physician and author: b. Tewksbury, Mass., 1 March 1851. He was graduated at the medical department of the University of New York in 1875; and practised his profession in Lawrence, Mass., until 1881, when he removed to New York. He has been a visiting surgeon to many of the hospitals in the latter city; is professor of surgery in the New York School of Clinical Medicine; and has published 'Operations for Hernia' (1890); and 'Local Anæsthetics' (1893).

Manlius, mǎn'li-ūs, Marcus, Roman legendary hero, of the 4th century B.C., called Capitoline because of his successful defense of the Capitoline Hill. Tradition says he was aroused to action by the cackling of Juno's sacred geese just in time to prevent the surprise of the citadel by the Gauls (390 B.C.). Two years before (392 B.C.), he defeated the Æqui; and in six years after (384 B.C.) was thrown from the Tarpeian rock, having been declared guilty of plotting to become king or dictator. This judgment, almost certainly unjust, was due to the envy of the patricians, who distrusted Manlius' philanthropic endeavors to free plebeians sold for debt.

Manly, Basil, American clergyman and educator: b. Pittsborough, Chatham County,

N. C., 28 Jan. 1798; d. Charleston, S. C., 25 Jan. 1865. He was graduated at South Carolina College in 1821, and, after filling several charges, in 1837 he became president of the University of Alabama, remaining there nearly 20 years.

Manly, John Matthews, American educator: b. Sumter County, Ala., 2 Sep. 1865. He was graduated at Harvard in 1889. Professor of English in Brown University 1891-8; and in the University of Chicago after 1898. He has contributed to several periodicals and has edited 'Macbeth' (1896); and 'Specimens of the Pre-Shakespearian Drama' (1897).

Mann, Donald D., Canadian contractor and financier: b. Acton, Ont., 1832. In the later 70's he went West, became manager for a firm of contractors who had a sub-contract on the Canadian Pacific line, and thereafter worked continuously as a contractor until the completion of the main railway. Between 1881 and 1883 he completed various contracts for railroads, and in the two following years began railroad-building in the mountains. He also undertook contracts for construction and tunnels in Columbia Cañon and in the Selkirk Range of the Rocky Mountains. Together with Mr. William Mackenzie (q.v.) he constructed the Canadian Northern Railway (q.v.). In 1887 and a part of 1888 they constructed the Canadian Pacific short line through Maine. In December, 1888, Mr. Mann visited Panama, Ecuador, Peru and Chili with a view of building railways for the Chilean government, but was not satisfied with the prospects there and declined the contracts offered. Later he visited China. From August 1889 to November 1892 he was associated with Mr. James Ross in building the Qu'Appelle, Long Lake & Saskatchewan Railway and was one of the original syndicate which built the Winnipeg electric street railway. He is also interested in many other enterprises.

Mann, Henry, American journalist: b. Glasgow, Scotland, 25 March 1848. He was educated in Scotland and England, but at 15 came to the United States where he served in the Federal army in 1864-5 and later in the wars with the Indians in the Northwest. He has been on the editorial staff of the leading New York and Providence newspapers and was special correspondent in the war with Spain. In 1895-6 he was editor of the 'Home and Country Magazine' and in 1898-9 assistant editor of 'Success.' He has published: 'Ancient and Medieval Republics' (1879); 'Features of Society in Old and New England' (1885); 'Turning Points in History' (1895); 'The Land We Live In' (1896); 'Adam Clarke' (1904).

Mann, Horace, American educationist: b. Franklin, Mass., 4 May 1796; d. Yellow Springs, Ohio, 2 Aug. 1859. He was graduated from Brown University in 1819, studied law at the Litchfield (Conn.) law school and in offices at Dedham, Mass., in 1823 was admitted to the bar, and practised at Dedham from 1827 to 1833, when he removed to Boston. In 1827-33 he was a representative in the State legislature, in 1833-7 State senator, and in 1836-7 president of the senate. From the first he identified himself with philanthropic interests. His first speech in the assembly was on religious liberty;

and one of his enterprises was the establishment of the State lunatic hospital at Worcester (1833), in connection with which he was chairman of the board of commissioners and later of the board of trustees. In 1837, upon the appointment by the State of a board of education to revise and reorganize the Massachusetts common-school system, Mann became secretary to the board (19 June). He withdrew from politics and from a lucrative practice at the bar, and devoted himself entirely to a work which proved of the greatest significance not for Massachusetts only but for the entire United States. This work he accomplished largely in spite of opposition often pronounced. For the reform of State education he founded and edited the monthly 'Common-school Journal,' held teachers' conventions, published 12 most valuable annual reports, and established normal schools. In 1843 at his own expense he visited Europe for the study of Continental methods. He was successful in arousing throughout the country an unprecedented interest in educational affairs. In 1848 he was elected to Congress to succeed John Quincy Adams, deceased; and he served until March 1853. He was strongly opposed to slavery, and fearlessly attacked Webster's course. On 15 Sept. 1852, he declined the nomination for the governorship of Massachusetts, and on the same day accepted the presidency of Antioch College, Yellow Springs, Ohio, in which post he served until his death, greatly influencing the educational development of Ohio. He was a fellow of the American Academy of Arts and Sciences. In addition to his annual reports he published: 'Reply to 31 Boston Schoolmasters' (1844); 'Report of Educational Tour' (1846); 'A Few Thoughts for a Young Man' (1850). 'Slavery: Letters and Speeches' (1852); 'Lectures on Intemperance' (1852); 'Powers and Duties of Woman' (1853); and 'Sermons' (1861). Consult the 'Life' by Mary P. Mann (1865); and Boone, 'Education in the United States' (1890).

Mann, Tom, English socialist: b. Foleshill, Warwickshire, 15 April 1856. His boyhood was spent in farming and mining and from the age of 14 he served an apprenticeship of seven years at engineering in Birmingham; and in 1877 he went to London, where he was prominent in connection with various trade-union affairs, and in 1885 he became a Socialist. Among his works are: 'A Socialist's View of Religion' (1896); 'The Position of the Dockers and Sailors' (1897); 'The International Socialist Movement'; etc.

Manna, a name for several substances, especially a saccharine matter which exudes naturally or from incisions made in the trunk and branches of a species of ash (*Fraxinus ornus*). It first appears as a whitish juice, thickens on being exposed to the air, and when dried forms a whitish or reddish granular substance, which is the manna of commerce. The tree is a native of Italy, and is cultivated extensively in Sicily. June and July are the two months in which the manna is collected. It is detached from the trees with wooden knives and is afterward exposed to the sun for drying. A little rain, or even a thick fog, will often occasion the loss of the collections of a whole day. The taste is sweet, and slightly nauseous. It is a mild pur-

gative, and is principally administered to children. The finest kind of manna is called *flake manna*; it is white or yellowish-white in color, light, porous, and friable. *Sicilian manna* is generally found in small, soft, round fragments; its color is yellowish-brown, and it is generally mixed with more or less impurities. The principal constituent is mannite, chemically separable as a white crystalline substance of a sweetish taste, which also appears as a whitish efflorescence on certain edible seaweeds and fungi. To this, and the saccharine elements, the nutritiousness of manna is due.

Many other sweet tree-juices go by the name of manna, or false manna, since they contain no mannite, but depend for their peculiar qualities upon the possession of melitose or meleztitose. In many cases the exudation of the sap is due to the irritation produced by insects or is the product of the insects themselves. Thus edible exudations are obtained from the oriental teatree, sandal-wood and an Australian grass (*Andropogon*); in Europe from the larch and an oak, and in Persia from the camel's-thorn. American manna is derived in California from the sugar pine and from a rush (*Phragmites*); while in India a species of bamboo secretes it so copiously as to form an important food-resource for the people in periods of famine.

The tamarisk manna, derived from the tamarisk trees about the eastern end of the Mediterranean, is not a direct product of the tree, but of a scale-insect, the manna-insect (*Jossyfraria mannifera*), which abounds upon the tamarisk and secretes the substance, which some persons have regarded as the manna of the Bible. In Australia the waxen larval cases of several species of flea-lice (*Psyllidæ*) that feed upon the gum-trees (*Eucalyptus*) are gathered and eaten by the natives under the name of "lerp."

The Scriptural manna (Heb. Man-hu, what is it?) is described in Exodus (xvi. 15) as covering the ground in such quantities as to supply food for the vast multitude of the Israelites. It was small and round like coriander seed, white and tasting like honey and wafer. It cannot be identified with any of the substances known nowadays as manna; but is called in the Bible "bread from heaven," while the Jewish doctors taught that it became to each person who ate it that meat of whatever kind he liked best.

Mannaia. See GUILLOTINE.

Mannheim, män'him, Germany, a town of Baden on the Rhine, at the confluence of the Neckar, 66 miles by rail southwest of Frankfurt. Dikes protect it from inundation and there are extensive harbors and modern docks. A bridge across the Rhine, here 1,200 feet wide, connects with Ludwigshafen, Bavaria, and there is also a bridge across the Neckar. Mannheim is the first commercial town in the grand-duchy and on the upper Rhine. This it owes to its admirable position on two important navigable rivers, and its railway communications. The principal articles of trade are corn, flour, wood, petroleum, coal, tobacco, cattle, sugar, iron goods, etc. The manufactures consist chiefly of iron-castings, machinery, chemicals, cigars, carpets, woolen goods, celluloid and rubber wares, mirrors, carriages, trinkets, sugar, liqueurs, starch, glue, etc. Mannheim was once strongly

fortified and lying not far from the French frontier, and near the centre of military operations, suffered severely during the wars between France and Germany. In a siege by the Austrians in 1795 only 14 houses remained uninjured. Hence, notwithstanding the antiquity of its foundation, it has become an entirely modern town with regular, straight streets, known, as in America, by numbers, and with fine public squares. The principal buildings are the former Palatine palace, with a museum and picture-gallery in one of its wings, a public library, and good gardens behind it; the Jesuits' church, an imposing edifice, with a profusely decorated interior; the former observatory building; the theatre, one of the best in Germany; several gymnasias and schools; conservatory of music; hospitals and orphanage; town-house; railway-station, etc. Pop. (1895) 97,980; in 1899 the suburb of Neckarau was incorporated with it; pop. (1900) 140,384.

Manning, män'ing, Daniel, American journalist and financier: b. Albany, N. Y., 16 May 1831; d. there 24 Dec. 1887. At 10 he entered the printing-office of the Albany 'Atlas' which shortly after was merged in the 'Argus' upon which paper he became a reporter and in time an authority in State politics. He was associate editor in 1865 and later was part owner of the paper which in his hands was a strong political power and instrumental in breaking up the Tweed ring. He strongly supported Gov. Tilden's administration and through his membership of the New York State committee he was intimately connected with the leaders of his party. Upon Cleveland's inauguration in 1885 Manning was appointed secretary of the treasury, the affairs of which office he conducted with great ability. He resigned in 1887 as a result of ill health, though he was connected with several commercial and banking enterprises until his death in the same year.

Manning, Henry Edward, cardinal of the Roman Catholic Church and archbishop of Westminster: b. Totteridge, Hertfordshire, 15 July 1807; d. Westminster 14 Jan. 1892. He was educated at Harrow, and Balliol College, Oxford, became a fellow of Merton College in 1832, and in that year he was ordained and appointed curate of Woollavington-cum-Graffham in Sussex. In 1833 he became rector of Woollavington, and was appointed archdeacon of Chichester in 1840. In 1842 he was select preacher to the University of Oxford. He took very little part in the tractarian movement and did not write any of the tracts, but he formed friendships with some of the leaders of the movement. In 1851, after the decision in the "Gorham case," he joined the Roman Catholic Church and was ordained priest. He founded the Congregation of the Oblates of St. Charles at Bayswater, London, in 1857, and upon the death of Cardinal Wiseman was consecrated archbishop of Westminster in 1865. At the Ecumenical Council in 1870 he was an ardent supporter of the infallibility doctrine, and in 1875 was made a cardinal by Pius IX. Manning was a trusted leader of the Ultramontane party in his church, and he commended himself to the world in general by his zeal on behalf of temperance, education, and the betterment of the working-classes. He is the author of four volumes of sermons published before 1850; and among his other

writings are: 'Temporal Power of the Popes' (1860); 'The Temporal Mission of the Holy Ghost' (1865 and 1875); 'Petri Privilegium' (1871); 'The Vatican Decrees' (1875); 'The Catholic Church and Modern Society' (1880); 'The Eternal Priesthood' (1883); 'Characteristics' (1885); 'Miscellanies' (1877-88); 'Religio Viatoris' (1889). Consult Lives by Hutton (1894); Purcell (1896); De Pressense (1903); Fitzgerald, 'Fifty Years of Catholic Life and Progress' (1901). See His Memorials (1892).

Manning, James, American Baptist clergyman, first president of Brown University: b. Elizabeth, N. J., 22 Oct. 1738; d. Providence, R. I., 29 July 1791. He was graduated at Princeton College in 1762, in 1763 became pastor of a Baptist church at Morristown, N. J., and about a year later pastor of a church in Warren, R. I. There he almost immediately commenced a Latin school, which seems to have been in some sense the germ of Rhode Island College. He had previously proposed to several influential men in his denomination, assembled at Newport, the organization of "a seminary of polite literature, subject to the government of the Baptists," and had drawn up a plan for such an institution. In 1764 the legislature granted them a charter, and in 1765 he was appointed "president and professor of languages and other branches of learning, with full power to act in these capacities, at Warren or elsewhere." The college went into operation at Warren in 1766, and the first commencement was held there in 1769, when a class of seven was graduated. In 1770 it was determined to remove the college to Providence, and during the Revolution, when the college edifice was occupied as a military barrack, and afterward as a hospital, he was actively engaged in clerical duties, and also rendered important services to the patriotic cause. In 1783 he resumed his duties at the college, and in 1786 represented Rhode Island in Congress, where he exerted himself to secure the adoption of the national Constitution. From 1770 till the year of his death he was also pastor of the first Baptist Church in Providence. He resigned the presidency of the college in 1790. Consult: Guild, 'Life and Times of James Manning and the Early History of Brown University' (1894). See BROWN UNIVERSITY.

Manning, Thomas Courtland, American jurist: b. Edenton, N. C., 1831; d. New York city 11 Oct. 1887. He was graduated from the University of North Carolina, admitted to the bar and for a time practised law in his native place, but in 1855 he went to Alexandria, La., and there established himself in a large practice. He was a delegate to the Secession Convention and at the outbreak of the war entered the Confederate army as lieutenant. He served as adjutant-general in 1863 and attained the rank of brigadier-general. In 1864 he was associate judge of the supreme court of Louisiana. He was a presidential elector in 1872 and 1876 and in 1877 he was chief justice of the State supreme court. He was denied admission to the Senate upon his appointment to that body in 1880, and in 1882-6 he again filled the office of justice of the supreme court. He was appointed minister to Mexico in 1886 and died in office.

Manning, S. C., town, county-seat of Clarendon County, on the Atlantic Coast Line

railroad; about 50 miles southeast of Columbia, and 70 miles north of Charleston. It is situated in an agricultural region, and in the vicinity are large pine forests. Some of the manufactures are flour, lumber, and knit goods. Pop. (1900) 1,430.

Man'nite, or **Mannitol**, a singular chemical compound which has the formula $C_6H_{14}(OH)_6$, and constitutes from 30 to 60 per cent of the weight of the dried juice which exudes from the manna ash (*Fraxinus ornus*), a tree growing in the Mediterranean regions. It occurs also in many other plants, and is formed in the lactic fermentation of sugar, and also in the spontaneous fermentation of the juice of the sugarcane, in tropical countries. It may be prepared by boiling manna with dilute alcohol, the mannite crystallizing out upon cooling. The crystals are then purified by re-crystallization from water. It is a white compound, crystallizing in needles or four-sided prisms, and is readily soluble in water, insoluble in ether, and but slightly soluble in alcohol. It melts at 329° F., and begins to sublime at about 400° F. Mannite has a pleasant, sweet taste, and in some respects it resembles the sugars. It is not a sugar, however, but a hexatomic alcohol. (See ALCOHOL.) Chemically, it is derived from the hydrocarbon hexane, C_6H_{14} , by the replacement of six atoms of hydrogen by six molecules of hydroxyl (OH). Sorbite (or sorbitol) and dulcite (or dulcitol) have the same chemical formula as mannite, and resemble it very closely. They are, in fact, isomers of mannite. Sorbite is prepared from mountain ashberries, and dulcite from Madagascar manna. See MANNA.

Mannlicher, män'lih-ër, **Ferdinand**, RITTER VON, Austrian engineer and inventor: b. Mainz 30 Jan. 1848. He was chief engineer of the Northern railroad for many years, and after the success of the needle-gun at Sadowa in 1866 began experiments which ultimately produced a magazine rifle which was adopted by the Austrian army in 1885. He has become famous for his numerous inventions in small arms and was elected to the Upper House of Austria in 1899 in recognition of his distinguished services.

Manobas, mã-nô'bäs, a native tribe of the Philippines, living chiefly in the valley of the Rio Agusan, island of Mindanao, and at some places in the district of Davao, Mindanao. They are of Malay race, head-hunters, and largely heathen, though the work of the Jesuits among them has resulted in a considerable portion becoming Roman Catholics. The name in earlier times was often applied to other heathen tribes of Mindanao.

Manœuvres, mã-noo'vêrz. See ARMY AND NAVY MANEUVERS.

Manom'eter (Greek, "rarefaction measurer"), an instrument for measuring the pressure exerted by a gas or liquid. It may have many forms, of which the mercurial barometer is one. (See BAROMETER.) One of the commonest designs, for the measurement of pressures not greatly different from that of the atmosphere, consists of a U-tube, one of whose legs is open to the air, while the other is in communication with the gas or liquid whose pressure is to be measured. The lower part of the U is filled with some non-volatile liquid of known density, and the difference between the

pressure of the fluid under examination and that of the atmosphere is found by observing the difference between the levels of the manometric fluid in the two branches of the U-tube. If the absolute pressure of the fluid is desired, it is necessary to add the atmospheric pressure to the differential pressure as read from the manometer. In rough work it may be sufficient to assume the atmospheric pressure to be 14.7 pounds per square inch; but in more refined observations the atmospheric pressure must be determined by reading the barometer, simultaneously with the manometer. Mercury is commonly the liquid that is used in the U-tube, but when the differences in pressure that are to be read are very small, some less dense liquid may be used with advantage. Sulphuric acid is often employed in such cases; and where (as in the measurement of chimney draft) a slight amount of evaporation from the manometric fluid is unimportant, water may be employed. When the pressure to be measured materially exceeds one atmosphere, the siphon manometer, as just described, is modified by sealing one of the ends of the U-tube, instead of leaving it open to the air. In this case the pressure is determined by observing the amount of compression that it produces in the air that is confined in the sealed arm of the siphon, by the manometric fluid; for it is known, by Boyle's law, that the volume of the air in this arm is sensibly proportional to the reciprocal of the absolute pressure, so long as the temperature remains constant. (See GASES, GENERAL PROPERTIES OF.) Boyle's law is not rigorously exact, however, and when a high degree of precision is required from the compression manometer, it is necessary to make allowances for its error. Data for this purpose have been given by Amagat, up to 85 atmospheres, when the temperature of the manometer is maintained at 16° C. (60.8° F.). (See Amagat, 'Comptes Rendus,' Vol. XCIX., p. 1153; Preston, 'Theory of Heat,' p. 403.) In steam engineering the commonest form of manometer is the "Bourdon gauge," which depends for its action upon the elastic deformation of a flattened metallic tube when exposed to an internal pressure. In practice the flattened tube is bent into a circular form, one end of it being fixed while the other communicates, by means of a multiplying gear, with an index hand which travels over the face of a graduated dial. A tube so constructed straightens out slightly when subjected to an internal pressure, returning again to its original form when the pressure is removed. The deformation is approximately proportional to the magnitude of the pressure (so long as the tube is not strained beyond its elastic limit), and hence the dial may be graduated, without difficulty, so as to indicate true pressures, at least to a degree of precision quite sufficient for the purposes of steam engineering. All such gauges should be carefully compared with a standard mercury column, however, before great reliance is placed upon them; for it is found that they are sometimes seriously in error in some parts of the scale, even when sensibly correct in other parts. In using them in connection with steam boilers, care should also be taken to prevent steam or highly heated water from coming in direct contact with the curved tube, since the elastic properties of the tube are injured by overheating. To ensure the proper protection of the gauge, a siphon, or a complete

circular bend, should be placed in the pipe between the gauge and the boiler. The trap so formed will fill with water of condensation the first time the boiler is fired up, and thereafter it will be impossible for steam to enter the gauge directly.

Manon Lescaut, *mā-nōn lēs-kō*, a romance by the Abbé Prévost, published in Amsterdam in 1733, when its author was in exile. It is appended to 'Memoirs of a Man of Quality' as a kind of postscript, and is ranked by critics as the first example in French literature of what may properly be considered a novel.

Man'or (old French *manoir*, *manèir*, from L. *manere*, to remain, being the residence of the owner) a piece of territory held by a lord or great personage, who occupied a part of it, as much as was necessary for the use of his own household, and granted or leased the remainder to tenants for stipulated rents or services. No manors, with all their incidents and franchises, have been granted in England since the reign of Edward III. One of the most important incidents to these ancient manors was the right to hold a court, called a *court-baron*, which was held within the manor, and had jurisdiction of misdemeanors and nuisances within the manor, and disputes about property between the tenants. The manor system was in vogue in the United States only during the British occupation; but many old manor names like Briarcliffe manor, Pelham manor, etc., are still retained by the present owners of large estates. See also TENURE.

Mans, *mān*, **Le**, France, the capital of the department of Sarthe, on a height above the Sarthe, here crossed by three bridges, 115 miles southwest of Paris. It consists of a lower and an upper town. The principal edifice is a fine Gothic cathedral of the 10th century. The chief manufactures are metal-works, tobacco, and woolen and linen goods; and the trade in these and other goods is considerable. Le Mans existed in the time of the Romans under the name of Cenomani, a tribe who inhabited the district. Numerous vestiges of Roman structures (subterranean aqueducts, walls, etc.), still remain. It was long in the possession of the English, and Henry II., the first Plantagenet, was born here. During the Franco-German war (1870-1) Gen. Chanzy was defeated here by Prince Frederick Charles and the Grand-duke of Mecklenburg. Pop. (1901) 52,902.

Mansard, *mān-sār*, or **Mansart**, **François**, *frān-swā*, French architect: b. Paris 23 Jan. 1598; d. there 23 Sept. 1666. He designed many important buildings in Paris, as well as provincial chateaux and country seats. The chateaux at Bolois are partly his work, and he built the Church of Val de Grâce and the Hotel Carnavalet. The Mansard roof is called after him.

Man'sard Roof, in architecture (so called from François Mansard, or Mansart (q.v.), a French architect to whom the invention is attributed), a roof formed of two sets of rafters, of which the upper set are more inclined to the horizon than the lower set, and form an obtuse angle at the ridge. The transverse beams connecting the lower ends of the under set of rafters are called as in ordinary roofs tie-beams; the corresponding beams at the union of

MANSART — MANSFIELD

the upper and under rafters are called collar-beams.

Mansard Roof.

Mansart, Jules Hardouin, zhül är-doo-än män-sär, French architect: b. Paris 16 April 1645; d. Versailles 11 May 1708. He was a nephew of François Mansart, or Mansard (q.v.). He directed all the great building operations of Louis XIV., who heaped favor and wealth upon him. His works include the palace at Versailles; the Maison de Saint-Cyr; the Grand Trianon; the dome of the Invalides; and the Chateau de Clagny, the residence of Madame de Montespan. He also designed the Place Vendôme, and the Place des Victoires.

Manse, in Scotch law, a name given the dwelling house of the minister of the Established Church. In popular use the term is often applied generally to the dwelling house of any minister of a dissenting congregation. In the Established Church every first minister of a rural parish is entitled to a manse, which the heritors or landed proprietors in the parish are bound to build and uphold. When a manse has been built or repaired by the heritors it becomes a free manse, and all ordinary repairs have to be done at the charges of the minister.

Man'sel, Henry Longueville, English logician and theologian: b. Cosgrove, Northamptonshire, 6 Oct. 1820; d. London 30 July 1871. He was educated at St. John's College, Oxford, and took orders in the Anglican Church in 1845. He became Waynflete professor of philosophy at Oxford in 1859; Regius professor of ecclesiastical history 1867; and Dean of St. Paul's, London, 1868. He was made a canon of Christ Church, Oxford, in 1867. Among his publications are: 'The Philosophy of Kant' (1856); 'The Limits of Religious Thought,' being the Bampton lectures for 1858; 'Metaphysics, or the Philosophy of Consciousness' (1860); 'The Philosophy of the Conditioned' (1866); 'Letters, Lectures, and Reviews' (1873).

Mansfeld, mäns'fält, Peter Ernst I., COUNT, Austrian general and statesman: b. 15 July 1517; d. Luxemburg 22 May 1604. He became governor of the Low Countries after the death of the Duke of Parma.

Mansfeld, Peter Ernst II., COUNT, German Protestant military leader: b. Luxemburg, 1580; d. Racowitza, Bosnia, 29 Nov. 1626. He was a natural son of the preceding, but, disappointed in regard to the inheritance of his father's lands, joined the Protestant princes and became the bitter enemy of Austria. He gained a victory over Tilly at Wiesloch in 1622 but was defeated by Wallenstein at Dessau in 1626, and died soon after.

Mansfield, mäns'föld, Edward Deering, American author: b. New Haven, Conn., 17 Aug. 1801; d. Morrow, Ohio, 27 Oct. 1880. He

was graduated at West Point in 1819 and at Princeton in 1822 when he took up the study of law and was admitted to the bar in 1825. He went to Cincinnati and there engaged in practice until 1835 when he accepted the chair of constitutional law and history in Cincinnati College. This post he resigned to enter the field of journalism and was editor of the 'Cincinnati Chronicle,' the 'Atlas,' and the 'Railroad Record.' For many years he was a contributor to the New York newspapers under the title 'Veteran Observer.' Among his many books are: 'Political Grammar' (1834); 'History of the Mexican War' (1848); 'American Education' (1850); 'Personal Memoirs' (1879); etc.

Mansfield, Joseph King Fenno, American soldier: b. New Haven, Conn., 22 Dec. 1803; d. near Sharpsburg, Md., 18 Sept. 1862. He was graduated from West Point in 1822 and was engaged in engineering service under the government until the opening of the Mexican War when he became chief engineer under Gen. Taylor. He took an active part in the engagements at Fort Brown, Monterey and Buena Vista, receiving promotion to the rank of colonel in recognition of his services. In 1853 he was appointed inspector-general of the United States army and served in that capacity until 1861 when he was made brigadier-general and given command of the Department of Washington which he fortified; he was afterward in command at Hatteras, Camp Hamilton, Newport News, and after capturing Norfolk was placed in command at Suffolk, Va., receiving the rank of major-general. He was in command of a corps of the Army of the Potomac at Antietam and while leading his troops fell fatally wounded.

Mansfield, Richard, American actor: b. Heligoland 1857; d. New London, Conn., 30 Aug. 1907. He first studied art, opening in a studio in Boston for a time, but later returned to England, and entered the theatrical profession. He at first played small parts in comic opera, and first appeared in America as Dromez in 'Les Manteaux Noires' at the Standard Theatre, New York. He afterward was very successful in a wide variety of plays, and became the head of his own company. He created such parts as Beau Brummel, Baron Chevril, Dr. Jekyll and Mr. Hyde, and Monsieur Beaucaire; among his other most successful roles were: Cyrano de Bergerac, Shylock in 'The Merchant of Venice,' Henry V., Brutus in 'Julius Caesar,' and Prince Karl in 'Old Heidelberg.' His own acting, as well as the work of his company which he carefully oversaw, was of a high artistic standard, carefully worked out in details. Consult: Strang, 'Famous Actors of To-day in America.'

Mansfield, William Murray, EARL OF, British jurist: b. Scone, Scotland, 2 March 1705; d. London 20 March 1793. One of the youngest sons of Viscount Stormont, he was educated at Christ Church, Oxford; studied law; was called to the bar in 1730; won a large Scottish practice and many literary friends, the foremost being Alexander Pope; and in 1742 was made solicitor-general and entered Parliament. Though of Jacobite descent he unflinchingly upheld the Hanoverian interest in 1745, did special service in 1748 by his defense of the Treaty of Aix-la-

MANSFIELD — MANSLAUGHTER

Chapelle, and was admitted leader of the House. An attempt to prove him guilty of treason or disloyalty to the Crown was unsuccessful, though often obliquely repeated. He was made attorney-general in 1754, and chief justice and Baron Mansfield in 1756. He was a member of the cabinet, without office, for 15 years, but his part in politics waned after he went on the bench. He was still a typical Tory, however, and in 1770 sided violently with the government in the political libel trials and was sharply attacked by Junius. His unpopularity steadily increased because of his opposition to Wilkes, whose sentence, however, he greatly lightened because of a technical flaw which he discovered himself, and in general because of his contention in various famous cases of libel that the jury could decide only on the facts and not on any question of law. In 1774 in the case, *Campbell v. Hall*, he decided that countries acquired by British conquest were governed by the general principles of the British constitution; but in regard to the American colonies he insisted that their complaints could not be considered until they had submitted themselves to Parliament. He became Earl of Mansfield in 1776; proposed the coalition of 1779; and in 1780 suffered at the hands of the Gordon rioters because of his sympathy with Catholic emancipation. In 1788 he retired from the bench. Though so unpopular, and though constitutionally a believer in royal prerogative, Mansfield was a great judge, whose work was not too conservative, and an able, calm, logical debater. Possibly his greatest labor was his revision of the mercantile law.

Mansfield, England, a town in Nottinghamshire, 14 miles north by west of Nottingham, in a deep valley, surrounded by vestiges of Sherwood Forest. There are cotton-mills, manufactures of silk and cotton hosiery, lace thread-mills, etc. Pop. (1901) 21,441.

Mansfield, Ohio, city, county-seat of Richland County; on the Pennsylvania, the Baltimore & O., and the Erie R.R.'s; about 62 miles southwest of Cleveland and the same distance northeast of Columbus. Mansfield was first settled in 1807 by Jacob Newman, and became a borough in 1828 and a city in 1857. It is situated in a fertile agricultural region, and its manufactures and commerce are connected with the farm products of the county. The chief manufactures are boilers, agricultural machinery, pumps, soil pipe, steel harrows, brass goods, electrical supplies, stoves, webbing, suspenders, and wagons. The number of persons employed in the manufactories is about 3,500. The trade is principally in the manufactures of the city, farm and dairy products. The chief buildings are the Ohio State Reformatory, the Public Library, the Children's Home, and the Y. M. C. A. building. The city has 25 church buildings, nine large school buildings and several primary school and kindergarten buildings, one parish school, and two business colleges. Mansfield was the home of John Sherman. There are four banks with a combined capital of \$725,000. The government is vested in a mayor, boards of public service and safety and a council of seven members. Four members of the council are elected from the wards and three at large. The city owns and operates the waterworks, also a

large sewage and garbage disposal plant. Pop. (1890) 13,473; (1900) 17,640.

E. S. HIESTAND,
Editor of Mansfield 'Daily News.'

Mansfield, Pa., borough, in Tioga County; on the Tioga River, and on the Erie railroad; about 108 miles north by west of Harrisburg and 25 miles southwest of Elmira, N. Y. It is in the midst of an agricultural region and near the coal fields and oil region. Its chief manufactures are lumber, glass, sheet-iron, agricultural and mining machinery. It is the seat of a State normal school, and has two libraries, one of about 6,000 volumes belonging to the Normal School, and a city library containing about 2,000 volumes. Pop. (1900) 1,847.

Mansfield College, Oxford, England, a theological institution established in 1889 for the education of men for the Nonconformist ministry. It owes its inception chiefly to Congregational support. Its students must be graduates of some recognized university, or undergraduates of Oxford who have passed Moderations. The staff consists of a principal, a vice-principal, three lecturers, and a bursar. Mansfield House, at Canning Town (West Ham), is a settlement in connection with the college.

Mansfield, Mount, in Vermont, one of the highest elevations of the Green Mountains; in the northwestern part of the State, about 23 miles east of Burlington. The view from its summit includes the Adirondack and White Mountains, Lake Champlain, a large portion of the northern part of Vermont, and some of New Hampshire. See GREEN MOUNTAINS.

Mansilla de García, Eduarda, ã-doo-är'dä män-sel'yä dâ gâr-se'ä, Argentine novelist: b. Buenos Ayres 1838. Her maiden name was Mansilla; at 16 she married Manuel R. García, a diplomat; and at 19 published 'El Médico de San Luis,' possibly her best novel. It was followed by 'Lucia Miranda,' a historical novel on the discovery of La Plata, and by 'Pablo, ó la Vida en las Pampas,' which with its fresh description of Argentine life made a great impression in Paris and was praised by Hugo. She was a musician of much talent and wrote, besides novels, several plays.

Mansion House, in London, England, the official residence of the Lord Mayor, built on the site of the Old Stock Market in 1739, at a cost of \$213,190. It is an oblong building and contains an Egyptian banquet hall accommodating 400 guests.

Man'slaughter, the 2d degree of felonious homicide. Murder and manslaughter are distinguished from each other by the intent which causes or accompanies the act. If a homicide be not justifiable nor excusable, and yet be not committed with malice aforethought, it is manslaughter. It is quite certain that the intent need not be to kill; for while there must be a criminal intent to make a person amenable to law as a criminal, yet if one crime be intended, and in the act of committing it another of a higher character be also committed without intent, the criminal is responsible for this higher crime. The general principle laid down in respect to manslaughter is, that not only a positive intention to commit some crime, but mere negligence, may make one guilty. If any one take upon himself an office or duty requiring

care or skill, he is liable for the want of either; and if death be the consequence of his ignorance or carelessness, he is guilty of manslaughter. So if one driving furiously run over and kill a person whom he did not see, or if one in command of a steamer or sailing-vessel by reason of gross negligence run down a boat and some one in it be drowned, this would be manslaughter. So if any one, whether medical by profession or not, deal with another as a physician, and through gross want of care or skill kill him; or if any one charged with building a house of any kind construct it so badly that it falls and kills persons within or near it; or if in building he drop a stone upon some one passing below, and kill him; in all these cases he would be guilty of manslaughter, provided he were grossly negligent in the act causing the death. This is the essential question.

Blackstone defines manslaughter thus:

Manslaughter is therefore thus defined, the unlawful killing of another without malice either express or implied; which may be either voluntarily, upon a sudden heat, or involuntarily, but in the commission of some unlawful act.

The judicial treatment of this crime, being regulated by statute, varies in the several States. The element of premeditation is not essential to conviction of this crime. There are cases which the law regards as only manslaughter, without evidence of momentary excitement; partly because the law infers that from such a provocation there must be excitement; and partly, perhaps, because the party killed brought his death upon himself by his outrageous wrong. Thus, if a husband detects his wife in adultery, and instantly and purposely takes either her life or the adulterer's, it is only manslaughter. Not so, however, if he waits for a subsequent opportunity, for then the first reason wholly fails, and the killing becomes murder.

In New York State four degrees of manslaughter are defined. The first degree, briefly stated, consists of killing without the purpose of death, when the deceased was engaged in perpetrating or attempting a crime less than felony, and where such killing would be, at common law, murder. Assisting in self-murder is manslaughter in the first degree, as also wilfully killing an unborn quick child by injury to the mother if it would be murder in case the mother died from the injury. The second degree consists in procuring abortion otherwise; killing in the heat of passion without the intent of death, but in a cruel and unusual manner; or killing unnecessarily one attempting to commit felony. The third degree is killing in heat of passion, without intent of death, but with a dangerous weapon; involuntary killing, by procurement or negligence of another, while the person killed is engaged in committing a trespass on property; suffering an animal known to be mischievous to go abroad without care, or keeping it without care, and thereby causing death; receiving wilfully or negligently so many persons into a boat or vessel as to cause death; racing while in command of a steamboat carrying passengers, bursting the boiler, and so killing; killing by a physician while in a state of intoxication. The fourth degree may be said to include all other modes or forms of manslaughter, known as such at common law, and of a milder kind than the preceding. See HOMICIDE.

Mansurah, män-soo'rä, Egypt, a town on the Damietta branch of the Nile, 34 miles southwest of Damietta. It has railway connection with Zagazig and Cairo, and is the chief depot of the bread-stuffs, cotton, indigo, hemp, and flax which this part of the Delta produces. There are also linen and cotton manufactories, etc. Mansurah was founded in 1221 and here in 1250 during the Crusades, Louis IX. of France was captured and imprisoned. Pop. (1900) 27,200.

Manta, män-tä, Ecuador, city, port of entry on the Pacific coast; about 155 miles southwest of Quito. It has an excellent harbor and steamer connection with nearly all the Pacific coast towns of South America. It was founded as early as 1534-5, and for many years its importance has consisted in being the port of Monticristi, which is about 10 miles inland. The chief exports are coffee and rubber. Pop. 4,000.

Mantalini, män-tä-lé'né, a low and affected character in Dickens' 'Nicholas Nickleby' who lives on the labors of his wife, a mantua-maker.

Mantaro, män-tä-rö, a river in Peru which has its rise in the mountains in the western part of the province of Junin. Its source is about 13,000 feet above the sea. It flows south and east to Huanta, near which it breaks through the mountains and turns northwest, which course is continued for about 60 miles, when again it changes and flows northeast to Pisquitini, where it joins the Apurimac River and forms the Ené. The Mantaro is nearly 300 miles long and navigable only a short distance above the junction with the Apurimac. It has extensive water-power which is not used except in a few cities.

Mantegazza, Paolo, pä'ö-lö män-tä-gät'sä, Italian author and physiologist; b. Monza, Italy, 1831. He was educated at the universities at Pisa and Milan, spent several years in traveling, visiting almost every portion of the globe, after which he returned to Milan and practised medicine there. He was appointed professor of physiology at Pavia in 1860 and in 1870 became professor of anthropology at Florence, where he founded the Museum of Anthropology, also a society and a review of anthropology. He was a member of the Italian Parliament 1865-76 and then became senator. He is the author of many medical and philosophical books, among them are: 'Elementi d'igiene' (1875); 'Fisiologia del piacere' (1881); 'Le istasi umane' (1887); 'L'anno 3000' (1897); 'L'amore' (1898); etc. He has also written books of travel and has devoted a share of his attention to political affairs.

Mantegna, Andrea, Italian painter: b. Vicenza 1431; d. Mantua 13 Sept. 1506. His master Squarcione was induced by the talents which he displayed to adopt him as a son. The youth employed himself principally in drawing from antiques, and at the age of 16 painted a picture for the grand altar in the church of St. Sophia at Padua. About 1468 Mantegna entered the service of Ludovico Gonzaga, at Mantua, where he opened a school. Here he painted his great picture, the 'Triumph of Julius Cæsar,' for the tapestry of a palace erected in Mantua. It consists of several cartoons, which have since been transferred to Hampton Court. Gonzaga conferred on him the honor of knighthood in reward for his merit. Innocent VIII. invited the artist to Rome to paint in the Belvedere. One of the latest and best of this artist's works is the 'Madonna della Vittoria,' now in the Louvre

at Paris, in which Giovanni Francesco Gonzaga is seen returning thanks for the victory gained by him in 1496 over the forces of Charles VIII. The genuineness of this picture is, however, sometimes doubted. There are several others of his works in the Louvre, and an 'Annunciation' in the Dresden Gallery.

Man'tell, Gideon Algernon, English geologist: b. Lewis, Sussex, 1790; d. London to Nov. 1852. For many years he practised as a medical man, and employed his leisure time in studying the strata and fossil remains of the weald district, by which he was surrounded. Through his investigations the fossilized skeletons of the *Iguanodon* and *Hylæosaurus* were discovered, the fresh-water origin of the wealden beds demonstrated, and many other important facts established in regard to the geology of that district. He published 'The Fossils of the South Downs' (1822); 'Illustrations of the Geology of Sussex' (1822); and the very popular 'Wonders of Geology' (1838); and 'Medals of Creation' (1844). His magnificent collection of fossils was purchased in 1839 for the British Museum.

Mantell, Robert Bruce, American actor: b. Irvine, Scotland, 7 Feb. 1854. He made his début upon the stage at Rochdale, England, in 1876, and in 1878 played in juvenile roles with Modjeska in the United States. He then spent three years in England as leading man, returning to New York to play with Fanny Davenport. He became a star and plays at the head of his own company, presenting the leading classical and romantic roles, including Hamlet, Macbeth, Romeo, Richelieu, etc.

Mantes, mânt, France, a town in the département of Seine-et-Oise, on the left bank of the Seine, opposite Limay, with which it communicates by two handsome bridges connecting the banks with an island in the river, 29 miles west-northwest of Paris. It contains a fine Gothic church, with two lofty towers; a beautiful Gothic tower, the only remains of the church of St. Maclou; and has manufactures of leather and saltpeter, famous breweries, numerous mills, and a trade in leather, corn, and wine. William the Conqueror (q.v.) received his death-wound at Mantes. Pop. (1901) 8,034.

Manteuffel, män'toif-fél, Edwin Hans Karl, BARON VON, German field-marshal: b. Dresden 24 Feb. 1809; d. Karlsbad 17 June 1885. He entered the army in 1827 and advanced rapidly, becoming lieutenant-general of cavalry 1861. He took part in the Danish war of 1864, and next year was appointed governor of Schleswig. During the war between Prussia and Austria he commanded the army of the Main, and fought at Hemstadt, Vettingen, Rossbrunn, and Würzburg. He served with distinction in the Franco-German War, especially in several actions around Metz, at Amiens, and from June 1871 to July 1873 he commanded the army of occupation in France, and was made field-marshal. In 1879 he was appointed governor-general of Alsace-Lorraine, and in this capacity showed singular want of skill and tact in ruling a conquered people.

Manti, män'ti, Utah, city, county-seat of Sanpete County; on the Rio Grande, and on the Sanpete V. and the Western R.R.'s; about 125 miles south of Salt Lake City. Manti was settled in 1849 and incorporated in 1851. It is sit-

uated in an agricultural region, where sheep raising is one of the principal industries. Large coal mines are in the vicinity. The chief industrial establishments are creameries, flour mills, and machine-shops. The principal buildings are the Mormon temple, which cost \$1,500,000, and the public school building. Pop. (1890) 1,950; (1900) 2,408.

Mantineia, män-ti-ně'a, Greece, one of the most ancient and important cities of Arcadia, on the frontier of Argolis, on the little river Ophis. The site is now known as Palæopolis, and excavations and explorations by the French school at Athens have disclosed the foundations of the walls and buildings of the ancient city. Mantineia was known for its wealth, and famous for the battles fought near it; in 418 B.C., when the Argives, Athenians, and Mantineans were defeated by the Spartans. In 385 B.C., when the city was taken and destroyed by the Spartans and in 362 B.C., when the Thebans under Epaminondas defeated the Spartans, although the victory of the Thebans was purchased with the life of their commander. Mantineia was, in 226 B.C., surprised by Aratus; and in 222 B.C. taken by Antigonus Doson; on this occasion the town was sacked, and the inhabitants sold as slaves. Another battle was fought near Mantineia 207 B.C., between Machanidas, tyrant of Lacedæmon, and Philopœmen, general of the Achean League. The latter was victorious, and slew the tyrant with his own hand.

Mantiqueira, män-tě-kä'ě-rä, Serra Da, Brazil, a mountain range which is in the south-eastern part of the republic. It is about 75 miles from the Atlantic and extends nearly parallel with the coast for about 200 miles. Ranges connected with the Mantiqueira are often included with this range and the name Mitiqueira applied to the whole. Mount Itatiaia, the highest peak, is 9,000 feet above the sea. Several large rivers have their sources in this range.

Man'tis, an orthopterous insect of the family *Mantida*. These curious insects, allied to grasshoppers, abound in many parts of the world, and have always excited popular notice, and have been endowed with many supernatural qualities by the ignorant and superstitious of all countries. They are slender, with long, locust-like legs, oval wings, and a long neck-like prothorax, terminating in an angular head with large protruding eyes. The front legs are stout, spiny, fitted for grasping their prey, and are held up in front of them in an attitude that to some suggest prayer. Hence the names praying insect, prophet and the like often given to the more familiar species; to others they suggest other ideas, as of a horse pawing the air, whence our common species of the Southern States (*Stegomantis carolina*) is known as the "rear-horse," and in Europe these insects are called "camel-crickets." Why it should also be called "mule-killer" is harder to explain, probably it is by confusion with a scorpion also so called. These insects in tropical countries have come to assume various forms and hues similar to the flowers near which they lurk to catch the insects visiting the blossoms,—a protective measure which comes under the head of mimicry. A large proportion of the insects upon which they feed are injurious to crops, so that they may be regarded as beneficial to man. Among the Japanese and Chinese they are made

to minister to human amusement also, being kept in cages and made to engage in combats upon which the spectators bet money. The eggs of the mantis are laid in an oval mass upon the stem of a plant, and covered with a tough case of hardened mucus, which shows a curiously braided pattern of surface, and is easily recognized.

Mantis Shrimp, a large crustacean (*Squilla empusa*) of the order *Siomapoda*, which dwells in burrows between tide-marks along our eastern coast, and seizes marine worms, and the like, that come within its reach. Its general shape is shrimp-like, but it has strong claws on the second pair of legs, which much resemble the forelegs of a mantis (q.v.), are provided with sharp spines, and are so jointed that they can be folded back upon themselves like the blade of a clasp-knife, and so take a firm grip upon the struggling captives. It is quite blind, although the eyes appear to be well formed. A well-known European species is gathered for food by the coast people.

Mantle, (1) a kind of cloak or loose garment to be worn over other garments. (2) In heraldry the name is given to the cloak or mantle which is often represented behind the escutcheon. (3) The name given an invention used on lamps and in gas lighting. See GAS, ILLUMINATING.

Mantling, in heraldry, an ornament depicted as hanging down from the helmet, and behind the escutcheon. It is considered to represent either the cointise, an ornamental scarf which passed around the body, and over the shoulder; or the military mantle, or robe of estate. When intended for the cointise, it is cut into irregular strips and curls of the most capricious forms, whose contortions are supposed to indicate that it has been torn into that ragged condition in the field of battle. When the mantling is treated as a robe of estate, the bearings of the shield are sometimes embroidered on it. A mantling adjusted so as to form a background for the shield and its accessories, constitutes an "achievement of arms."

Mantraps, engines for the terrifying of trespassers and poachers (formerly often indicated by the warning notice "man-traps and spring-guns set here"), resembled gigantic rat-traps four feet long. They may be seen in museums; it is, since 1827, illegal to set them save indoors between sunset and sunrise, as a defense against burglars.

Mantua, mǎn'tū-a, Italy, a fortified northern town, capital of the former duchy, and now of the province of Mantua, 80 miles by rail southeast of Milan, on an almost insular site on the Mincio, which here divides into several arms ending in a marshy and insalubrious lake. Communication is maintained between the islands and mainland by several bridges, the chief of which is Ponte di San Giorgio, 800 yards long. Mantua is the see of a bishop, the seat of a civil, criminal, and mercantile court, and the residence both of a military governor and of a provincial delegate. The most remarkable edifices are the cathedral, after an elegant design by Giulio Romano; the church of Sant' Andrea, conspicuous from a distance by its majestic cupola and Gothic tower; the church of Santa Barbara, containing the mausoleum of Carlo

Gonzaga; the church of San Sebastiano; the Corte Reale, formerly the ducal palace of the Gonzagas, a huge irregular pile, now partly used as barracks; the Castello di Corte or old castle of the Gonzagas; the Torre della Gabbia, the Torre del Orologio, and the Torre dello Zuccharo; the Beccheria and Peschiera, or shambles and fish market, both built by Giulio Romano; the house of Giulio Romano, the Palazzo Coloredoro, with enormous caryatides supporting its façade; the Palazzo del Té, outside the walls of the town, also built by Giulio Romano, and adorned with some of that master's largest frescoes; the Accademia Virgiliana di Scienze e Belle Arti; the Liceo, the military arsenal, two theatres, one called the Teatro Virgiliano, employed for open-air performances in summer, situated in a fine piazza also named after Virgil, and containing a marble pillar surmounted by a bronze bust of the poet; the library, containing 80,000 volumes and 1,000 interesting MSS.; the civic and two foundling hospitals; the Monte di Pietà, the principal house of correction for the whole of Lombardy. The manufactures are of very limited extent. The trade is chiefly in the hands of the Jews, who live in a separate quarter. The principal article of trade is silk. There is also a considerable trade in timber, which is floated down the Mincio. Mantua was an ancient Etruscan settlement, and in the time of Virgil, a native of the region, was a Roman town. Charlemagne built its first fortifications. Soon after 1115 Mantua succeeded in making itself independent, and continued so till 1276, when it fell under the iron rule of Buonacolsi or Bonacossi. In 1328 it found better masters in the Gonzagas, who, first as captains, then (from 1432) as marquises, and finally (from 1530) as dukes of Mantua, governed it with great ability, and distinguished themselves by the splendor of their court and their patronage of literature and art. The last of the Gonzaga family who reigned in Mantua was Ferdinando Carlo, or Carlo IV., who, having taken part with the French in the War of Succession, was declared to have incurred a forfeiture by withdrawing his allegiance from his liege lord the Emperor of Germany. The Mantuan territory was accordingly annexed to the Austrian possessions in Lombardy, and the remaining part of Montferrat was assigned to Savoy (1708). The fortifications of the town, previously formidable, were completed and put into their present form by the Austrians. In 1796 Napoleon, apparently hopeless of reducing it by any other means, contented himself with keeping it under strict blockade, till famine compelled the garrison to capitulate. After the cession of the western part of Lombardy to Sardinia in 1859, Mantua, with what else of Lombardy remained to Austria, was united to Venetia, and with it was given up to Italy in 1866. Pop. (1901) 29,160.

Manu, mā'noo, the reputed author of the most renowned law-book of the ancient Hindus, and likewise of an ancient Kalpa work on Vedic rites. It is matter, however, of considerable doubt whether both works belong to the same individual, and whether the name Manu, especially in the case of the author of the law-book, was intended to designate a historical personage; for, in several passages of the Vedas (q.v.), as well as the Mahābhārata (q.v.), Manu is mentioned as the progenitor of the human race;

MANUAL ACTS—MANUAL TRAINING

and, in the first chapter of the law-book ascribed to him, he declares himself to have been produced by Virāj, an offspring of the Supreme Being, and to have created all this universe. Hindu mythology knows, moreover, a succession of Manus, each of whom created, in his own period, the world anew after it had perished at the end of a mundane age.

The word Manu—akin to “man”—belongs therefore, properly speaking, to ancient Hindu mythology, and it was connected with the renowned law-book in order to impart to the latter the sanctity on which its authority rests.

This work is not merely a law-book in the European sense of the word, it is likewise a system of cosmogony; it propounds metaphysical doctrines, teaches the art of government, and, among other things, treats of the state of the soul after death.

The chief topics of its 12 books are the following: (1) creation; (2) education and the duties of a pupil, or the first order; (3) marriage and the duties of a householder, or the second order; (4) means of subsistence and private morals; (5) diet, purification, and the duties of women; (6) the duties of an anchorite and an ascetic, or the duties of the third and fourth orders; (7) government and the duties of a king and the military caste; (8) judicature and law, private and criminal; (9) continuation of the former and the duties of the commercial and servile castes; (10) mixed castes and the duties of the castes in time of distress; (11) penance and expiation; (12) transmigration and final beatitude.

Bühler has proved that Max Müller was right in regarding the extant work as a versified recast of an ancient law-book, the manual of a particular Vedic school, the Mānavas; and holds that the work, the date of which used to be given at 1200 B.C., was certainly extant in the 2d century A.D., and seems to have been composed between that date and the 2d century B.C. There are many remarkable correspondences between this work and the Mahābhārata, suggesting the use in both of common materials.

Manual Acts, in ecclesiastical and church history, acts performed by the hands of the celebrant in the mass, chiefly the fraction of the host, and making the sign of the Cross over it before consecration. Both were objected to at the Reformation.

Manual Alphabet, the deaf and dumb alphabet; the letters made by deaf and dumb persons with their fingers.

Manual Exercises, the exercise or drill by which soldiers are taught to handle their rifles and other arms properly.

Manual Training, a term which, according to the best usage, signifies the systematic study of the theory and use of common tools; the nature of common materials; elementary and typical processes of construction; and the execution and reading of working drawings; and the study of cookery, sewing, printing, etc. The materials referred to are wood, metals, alloys, and plastic minerals; the drawing includes both freehand and instrumental, with pen, pencil, and brush. The systematic study of tools, processes, and materials is the essential feature of manual training; hence the incidental use of tools without system for some ulterior object, is not man-

ual training. There is of course a suggestion of manual training when the teacher shows a child how to handle a pitch-fork; when a woodman teaches a novice how to swing an axe in cutting down a tree; when a foreman shows a green hand how to head a pin. Yet such cases are usually without system and continuity; and accordingly are excluded from the content of manual training. One does not give a boy manual training by turning him loose in a shop, any more than he gives a literary education to a boy who cannot read by locking him in a library. It follows that the manipulations of the kindergarten, the “busy work” in the primary grades on the one hand, and the science laboratory and the commercial workshop on the other, are beyond the pale of manual training.

Manual training proves to be a far better thing than was expected when the name was first used and when the first manual training school was opened, and the present purpose and object of manual training is stated so broadly and philosophically that the statement published for many years in the catalogue of the Saint Louis manual training school seems very modest; to wit: (1) To furnish a broader and more appropriate foundation for higher technical education. (2) To serve as a developing school where pupils could discover their inborn capacities and aptitudes, whether in the direction of literature, science, engineering, or the practical arts. (3) To furnish to those who look forward to industrial life opportunity to become familiar with tools, materials, the methods of construction, and exact drawing, as well as with mathematics, elementary science, and ordinary English branches.

Manual training is essentially a culture study; its function is to develop the child by developing the brain and increasing its control over materials through the hand and eye. In early years the work of a child is qualitative rather than quantitative. Physiologists tell us that the areas of the brain develop gradually and unequally; that a normal child does not recognize accuracy and that he is incapable of precision either in ideas or deeds until he is several grades along in school. Tool work should result in accuracy in thought and in deed, and hence should not be attempted before the sixth or seventh grade. Dr. C. H. Henderson defines Manual Training as “quantitative handicraft.” He adds: “The brain grows by what it feeds upon. Given perfect health and a wealth of sense-impression, especially a wealth of quantitative sense-impression, that is to say, well-trained senses, and we have the physical basis for a full intellectual life. Without this large quantitative knowledge and developed brain, we live in a world of illusion, a guess-world of very imperfect rationality. To cultivate the hand and eye and ear, even the nose and the tongue, is to enlarge the material of thought and the tool of thought.” In 1882, before the National Educational Association at Saratoga, the writer of this article defined Manual Training as “a new art of expression,” in the concrete, as contrasted with verbal description, and graphical representations. This view of manual training has been much elaborated of late, with the result that “expression” is by many persons regarded as the very essence of

MANUAL TRAINING

manual training. This result is unfortunate, since it confuses "expression" with the "art of expression." The former is a product of manual training; the logical study of the "art" constitutes the sum and substance of the educational feature known as manual training.

All arithmetical operations depend upon the "fundamental rules"; the scientific study of a language begins with declensions and conjugations. So tool-work, drawing, needlework, cooking, etc., begin with fundamental processes with typical appliances upon typical materials. The articles constructed, the figures drawn, the garment sewed, or the dishes cooked, are incidental like blackboard work in long division, and like them they are valuable because they involve effort and result in mastery and power. The real end and aim of all education, whether "manual" or "spiritual," is the developed, strengthened, disciplined, executive person, regardless of the fate of the exercises or products which were the means of his development.

Originally, when manual training first took definite form in school education, it was generally assumed that it was intended to supersede the old form of trade apprenticeship, and not a few people defended and supported it on this ground. Because a boy learned how to use tools, how to keep them in order, and how to treat the common materials of construction, it was claimed that he was learning a trade, or several trades, and so the manual training school was regarded as a trade school. In spite of the fact that this assumption and this claim were both wrong, the practical value of the boy's knowledge of tools and skill in their use was for some years regarded as the chief evidence of the value of manual training.

In all ages men have recognized the value of skill in the use of tools and the processes of construction. The mythical Vulcan, the Jewish Tubal Cain, the Greek Dædalus, Archimedes of Syracuse, the Miltonian Memnon, are familiar examples. The greatest invention of the ages has been the generation, transmission, and utilization of mechanical power, and along with it has come the invention and use of tools. Rousseau advocated systematic instruction and practice in the details of a trade or occupation; and Carlyle in words now familiar to us all declared that man was a tool-using animal; that without tools he was nothing; with tools, he was all. In every land men advocated the learning of a trade for a livelihood, or for culture; witness, Peter the Great of Russia; the King of Prussia; and the New England seer, Emerson—but in all cases it was taken for granted that the only avenue to mechanical skill and culture lay through an apprenticeship to a builder or manufacturer. Schools were for the study and mastery of books. The arts of the schoolroom were for masters and freemen, hence they were noble, and were called the liberal arts. The arts of the mechanic were for serving men, and were acquired only by intimate association with mechanics; so the practical arts were held to be degrading, because requiring a base companionship.

Later the invention of machinery and the use of costly machine tools so far modified and limited apprenticeship as almost to ruin it. Trade schools sprang up all over Europe, and native American skilled mechanics ceased to ex-

ist. Numerous "manual-labor" or "half-time" schools came into being in America, but they involved no forward step, for the manual elements were unsystematic and unprogressive, since the purpose of the labor was to earn a living while gaining literary culture. Engineering schools in Germany, England and America introduced some features of "shop-work" with skilled mechanics engaged upon commercial work as foremen. Next arose a wide-spread demand for an opportunity for American boys to acquire the arts of the mechanic and at the same time avoid the narrowing unscholarly atmosphere of the trade school. It was then that it was first proposed "to put the whole boy to school," a maxim first used in Boston in 1885. The phrase meant to combine manual with mental training; to put the liberal arts and the mechanic arts into the same curriculum; to deal simultaneously with material forces and appliances and with spiritual forces and appliances.

This consummation was helped in a signal manner by an exhibit at the Centennial Exhibition at Philadelphia in 1876. In the educational exhibit from the Imperial School of Moscow there was a full presentation of the method of tool instruction devised by Victor Della-Vos, who gave three years to tool instruction and then three more to actual construction, with engineering students. His systematic analysis of tools and processes offered a practicable basis for such work in the programme of secondary schools. Professor John D. Runkle of the Massachusetts Institute of Technology performed a great service to education by publishing a report upon the Russian Exhibit, by emphasizing the difference between "instruction" and "construction," and by insisting upon the former as the special province of the school. Instruction shops for students of college grade were opened in Boston and in Saint Louis in 1877. The Saint Louis Manual Training School was established 6 June 1879, and opened in September 1880, as a school of secondary grade. This was the first of its kind and soon attracted wide attention from educators both at home and abroad. The Baltimore Manual Training School opened in 1883; the Jamestown, N. Y., School and the Chicago Manual Training School in 1884; the Toledo School the same year; the Central Manual Training School of Philadelphia in 1885; and then the movement became general. All these schools were of high school grade, and there was a close resemblance in curricula, equipments, and methods of instruction.

This progress was made not without strong opposition. It was asserted that tools and shops would lower the educational tone, degrade the high purpose of the school, and introduce confusion into the orderly conduct of the secondary school. It was claimed by eminent educators that the time spent in manual training would be an intellectual loss; that the graduates would become "a degraded mass of operatives" that the school was undertaking work which did not belong to it, etc. There is now abundant evidence that all these fears were groundless and that all the evil predictions were false. Better still, systematic and thorough manual training was found to have intellectual and moral value far exceeding all expectations.

MANUAL TRAINING

Great as is the economic and industrial value, the effect upon the mind and the heart is of far greater value. A recent writer, looking at the reflex action of manual training upon the pupil, maintains that when "rightly conceived and carried on, it promotes co-ordination, it develops creativeness, it broadens culture, it strengthens character." Nevertheless objections occasionally appear, some of which are extremely amusing. One opponent says: "I am opposed to teaching boys how to be sticks in all cases of emergency. You put a lad into a palatial shop and teach him how to be helpless all the rest of his life because he hasn't the tools handy."

In Germany where educational manual training was first introduced in 1886, there was violent opposition, partly because it was thought to be purely industrial, and partly on the general ground that manual training had not a single valid claim to entrance into the school programme. For arguments pro and con the reader is referred to the Reports of the United States Commissioner of Education and those of the National Educational Association for the years 1883-1894 inclusive. Active opposition practically ceased in 1890.

In 1904 there was in nearly every large city at least one manual training high school, and there were hundreds of secondary schools in which more or less manual training is available as an optional study. The European plan of making it a pure "extra" to be taken after hours is in little favor in the United States. No sooner was manual training shown to be a valuable educational feature in secondary schools than numerous efforts were made to introduce it into grammar schools in an elementary form. Hundreds of experiments have been tried with carefully selected lessons in wood, with hand tools only. In this study of tools and methods the Swedish Sloyd (so called) has served a very useful purpose in the way of suggestions. It is true the wooden spoons and ladles of Sweden have disappeared, and careful drawing as a preliminary to tool work has come into being, but the value of presenting a "motive" to a young child quickly became evident. An older pupil appreciates the theory of a tool and is at once interested in its peculiar construction, its range of service, and the correct ways of using it, just as an older boy is interested in the study of a rifle and in shooting at a mark, knowing that men use rifles for shooting at game, burglars, and public enemies. Children of from 10 to 14 years of age are always anxious "to make something," though generally quite unable to do so in a fruitful manner. They are incapable of good workmanship and impatient under criticism of matters to which they have given little or no thought. They are interested in finished objects, not in the sequence of steps, not in accurate measurements, close fits, and the use of the right tools in the right ways. Hence the greatest care is necessary in elementary grades that the exercises are simple, involving few elements, and that they are capable of analysis into steps which the child can fairly appreciate. Above all he must learn when and how to use each particular tool.

In England manual training is more often called technical education, and it is more often than not associated with trades, and even this in

a majority of cases is given in evening schools. There is as yet in Great Britain no general conviction that manual training is essential to intellectual development and that its moral influence is wholesome and strong. Accordingly it is planned for working people chiefly. Undoubtedly the educational value of tool work of the most elementary character as developed by Dr. Solomon of Sweden has had great influence in England, but manual training of a severer and more intellectual sort owes its establishment largely to Sir Philip Magnus of London, Sir William Mather of Manchester, and Prof. Ripper of Sheffield. Sir William has not only encouraged its introduction into Manchester schools, but has built and equipped a "Department of Manual Training and Technical Instruction" in Gordon College, Khartum, in Sudan, for the benefit of Sudanese boys. There is an abundance of elementary manual training in France, particularly in Paris, but no sooner is the boy old enough and strong enough to learn a trade than he is put at trade work. The French are convinced, as indeed are all nations, that the principles and details of a trade like the fundamental principles of a profession may be most successfully taught in a special school connected with a commercial or manufacturing establishment. Hence all the fine specimens of metal work exhibited by French educational institutions are the work of special or trade schools. Educational tool work is found in Australia, Japan, China, India, and in South America.

The Methods of Tool Instruction.—Methods vary greatly, not only with pupils of different grades where variation is necessary, but with different teachers in the same grades. While children of 12 years can be taught to care for and properly use some edge-tools, instruction in regard to the theory of machine tools, the laws of heat and friction, the theories of strength and stiffness are beyond them. In the hands of an expert every good hand tool has abundant theory and elegant uses. These should be carefully taught and illustrated. A manual training school is a place where the care and use of tools, details of processes, natures of materials, and the essential forms of construction are systematically explained and taught. No school omitting such systematic work is worthy of the name. Manual training, like instrumental music, is something to be taught, something to be studied and learned. The notion is too prevalent that the pupil must be left to find out how tools are to be used, and how the parts of a construction are to be joined—by himself without the aid of the teacher. One writer says "the pupil makes what he wants to make, and what he does not want to make is left unmade. He usually decides without help from the teacher. He is at liberty to go ahead and work out his own ideas rather than those imposed by the teacher." The trouble is that the novice, whether pupil or teacher, has no mechanical ideas worthy of serious consideration. The mechanic arts like other arts which have been slowly developed by study and research, should first be taught in all their fullness by one who has analyzed them into fundamental principles and processes, and who is an expert in teaching them. Both research and manufacture may properly supplement the course

MANUAL TRAINING

in a mechanical laboratory. Moreover, for the sake of clearness and fulness, the class method of instruction should be used. Assuming a well graded class (and the assumption is as reasonable in manual training as in any other study), the exposition and demonstration is far more logical and thorough when given to the class, as a whole, than when given in fragments and gestures to individuals. The place for individual instruction is in supplementing class instruction for the benefit of special pupils. The class method means progress as a class, as is generally the case in academic branches.

Long experience justifies the class method. Let the pupils be comfortably seated about the teacher, who should be equipped with a standard set of appliances. Every pupil should be able to see, hear, and to make notes or sketches. The statement of principles and theories and practical demonstration should rarely occupy one fourth of the laboratory period. The style and workmanship of the teacher should be as nearly perfect as possible. His handwork should always be accessible for inspection and model; he should never begin work for his pupils to finish, or finish work they have begun. Be it ever remembered that not the finished exercise, but the *doing of it*, is the main thing. The course of study in a particular laboratory should always be logical, never difficult, and more or less original every year. Like a flight of steps on a steep incline, the lessons should be suited to the pupils, without useless repetitions and without needless complications. The meaning and purpose of every lesson should be clear, and at its end the sense of mastery should reward every pupil. Synthetic exercises should follow the elements at intervals, more frequently with young pupils than with older. Such combinations stimulate zeal and show the logic of the course. A finer construction may end the course in each laboratory, but its educational value must not be over-estimated.

The Programme.—Seventh and eighth grade pupils may have one lesson a week in elementary work, not exceeding 2 hours in length. The ninth, tenth and eleventh grades may have 2 lessons per week in tool-work, and 2 in the rudiments of drawing and lettering, each lesson covering two school periods. The twelfth grade may extend the length of a lesson over three periods in the machine-tool laboratory, but have fewer lessons per week. The length of the lesson should depend upon the capacity of the pupils to give close attention to the work in hand. When attention fails, education stops. With the younger classes the full length of the lesson should not be given to one kind of occupation. For instance, let the plan be: A few minutes to general criticism of last exercise; a few to exposition and demonstration; a few to making or reading the working drawing; the remainder to steady work on the "regular" or an "extra" exercise. The element of comparison and criticism, by both pupil and teacher, should never be neglected. The standard should ever be reasonable perfection.

Size and Equipment of Laboratories.—Every laboratory should have from 40 to 60 square feet of floor space per pupil; the floor should be dry and warm; the room should be well lighted and ventilated; all moving machinery should be driven by an electric motor under the

immediate control of the teacher in charge; and immediately adjoining should be a store-room and a suitable lavatory. The mechanic arts equipment of a secondary school with 300 boys should contain a series of at least five working laboratories, namely: (1) For bench work in joinery and carving, and inlaying wood. (2) For wood-turning and pattern work. (3) For modeling, molding and casting. (4) For forging, brazing and soldering. (5) For metal work with bench and machine tools.

The second and third laboratories named above should be grouped as one suite, with one lavatory and store-room. This combination is for the 10th grade, or second-year pupils in a high school. Among engineering students (who are three or four years older) one finds heavy wood-working machines, foundry cupolas, steam hammers, gear cutters and 18-inch lathes and other machinery.

It may be well to point out the difference between a mechanic arts laboratory and the ordinary commercial shop. They differ in equipment, in the character and functions of the skilled men in charge, in the method of management, and in the character of the product. (1) In the commercial shop there is a great variety of tools and machines. In the laboratory there is a large degree of uniformity. (2) In the commercial shop the men in charge are skilled workmen, but not teachers. They are there to fill orders and to execute work as mechanics. In the mechanic arts laboratory the sole function of the skilled people in charge is to teach. (3) In a commercial shop every man is kept at work at what he can do best, and everything contributes to the production of articles for the market. In a mechanic arts laboratory when a boy or a class has learned a process or mastered a material, work ceases in that direction and something else is learned. The only product of a school laboratory of any great importance is the boy himself, and everything which does not contribute to his training and culture is excluded.

From the above it is clearly evident that the more a Manual Training School is made into a factory, the less it is a school. It goes without saying that manual training is but one feature of a secondary school. It occupies but two of the six periods on the school programme, and does not require home study. When such study is counted and added to the time given to mathematics, science, language and literature, it is evident that manual training occupies, in a well organized school, not more than one fourth of the time and intellectual energy of the faithful pupil.

Drawing.—The rudiments of freehand and mechanical drawing should go hand in hand through the course, covering lettering, orthographic, cabinet, isometric, and perspective projections; intersections, developments, tinting, line and brush shading; shadows; the details of machine and building construction; ornament, ancient and modern; tracing, blue-printing, pen-sketching, with some use of water colors—such are the elements to be combined in proper proportion. Domestic science and art for the girls is the counterpart of manual training. It may properly include some light wood work, and nearly all the drawing already laid down; and in addition, art study and practice, house deco-

ration, needle and sewing-machine work, garment cutting and fitting, cooking and household economics. See TRADE SCHOOLS.

CALVIN M. WOODWARD,
Washington University, Saint Louis, Mo.

Manucodia, măn-ü-cō'di-ä, in ornithology, a group of birds either belonging or closely allied to the *Paradiseida*, and peculiar to the Papuan sub-region. The plumage is glossy steel-blue; the outer and middle toes are united for some distance, and there is an extraordinary convolution of the trachea in the males, to which the loud and clear voice of the birds is owing. Mr. Sharpe divides the Manucodia into two genera: *Phonygama* (q.v.) and *Manucodia* proper, of which four species are admitted. *Manucodia chalybeata* (*chalybea*), from the northwest, and *M. comiei*, from the southwest of New Guinea; *M. atra*, widely distributed over the Papuan sub-region, and *M. jobiensis*, peculiar to the island whence it derives its specific name.

Manuel I., **Comnenus**, man'ü-ël köm-nē-nūs, a Byzantine emperor: b. about 1120; succeeded his father, Joannes II., in 1143, died in 1180. The valor which he had displayed against the Turks induced his father to bequeath the crown to him rather than to his elder brother Isaac, who was immediately imprisoned by Axuch, the minister of the deceased emperor. Returning from his campaign in Cilicia, Manuel was received with enthusiasm at Constantinople, but was at once involved in wars both in the East and the West, which lasted with brief intermissions through his reign. In 1144 he subjected Raymond, the rebellious Latin prince of Antioch. In 1145 he defeated the sultan of Iconium in successive pitched battles. In 1147 he promised his aid to the new crusade headed by Louis VII. of France and Conrad III. of Germany, and though he allowed them a passage through his dominions he gave secret information to the Turks.

In 1148 he began the most important war of his reign with Roger, the Norman king of Sicily, who had taken Corfu and prepared to invade Greece. He formed an alliance with the Venetians, who within a year joined him before the fortress of Corfu, which was surrendered after an obstinate siege. He was prevented from invading Sicily by hostilities of the Servians and Hungarians, instigated by Roger, the former of whom were vanquished in two campaigns, but the latter protracted the war till 1152. In that year he suffered a reverse from the Turks in Cilicia, but his general, John Ducas, gained so great successes in southern Italy that Manuel conceived the project of reuniting the eastern and western empires.

The defeat of Alexis, the successor of John Ducas, by William, the successor of Roger, soon followed; the Sicilian admiral Maius routed the Greek fleet off Negropont, and advanced toward Constantinople; and Manuel therefore accepted an honorable peace in 1155. Those Greek prisoners who were silk-weavers were retained in Italy, and gave origin to the flourishing Italian silk manufactures. In the following years he waged successful wars with Raymond, prince of Antioch, and Az-ed-din, the Turkish sultan. A new war soon broke out with Gejza, king of Hungary, which was terminated by a disastrous defeat of the Hungarians near the present Sem-

lin. In 1176 he experienced a terrible defeat from Az-ed-din in the mountains of Pisidia, and was obliged to sign a disadvantageous peace. By breaking the treaty and renewing the war he obtained honorable terms. Depressed by this disastrous expedition, he never recovered his former military enterprise and ambition. The heavy war taxes levied from his subjects during his reign were often employed in pensioning ministers and men of influence at foreign courts, while his troops went unpaid.

Manuel II., **Palæologus**, pā-lē-ōl'ō-gūs, a Byzantine emperor, born in 1348, succeeded his father Joannes V. in 1391, died in 1425. At the death of his father he fled from the court of the sultan Bajazet, with whom he had been left as a hostage. The consequence was a war with Bajazet, in which Manuel was supported by an army of Hungarians, Germans, and French. The allies, under the command of Sigismund, king of Hungary and afterward emperor of Germany, were defeated at Nicopolis in 1396, with the loss of 10,000 men. Constantinople was besieged, and its fall seemed impending, when the conquests of Tamerlane diverted the arms of the sultan. Manuel visited Italy, France, and Germany, vainly seeking assistance from the western princes. In the conflict between the Tartars and the Turks, he acted with diplomatic skill, and secured peace to his empire. He sent ambassadors to the council of Constance with instructions to urge a union of the Latin and Greek Churches; but his real object was only to obtain aid from the kingdoms of the West, and to alarm the Turks by the negotiations with those kingdoms.

Manuel, **Don John**, Spanish prince and author: b. Escalona, Spain, 5 May 1282; d. 1349. He was a nephew of Alfonso X., and cousin of Sancho IV. His public life was a restless and turbulent one, but his chief claim to remembrance comes from the fact that he was one of the first and one of the best of Spanish prose writers. He wrote in a style of singular simplicity and charm, and few Spanish authors have succeeded so well in giving to their words the calmness, the weight, the richness which come only from long experience and reflection. His principal work that remains is 'Libro de Patronio,' more commonly known as 'El Conde Lucanor,' which has been translated into the French and German languages.

Manufacturers, National Association of, an American association organized in Cincinnati in 1895. It had three primary objects, increasing the export trade; influencing State and National legislation; and arbitrating labor disputes. The association maintains a general office in New York city and issues numerous confidential reports and bulletins for the exclusive use of its members. The association is opposed to trade-unionism. In 1903 it had nearly 2,000 members. It publishes 'American Industries' (semi-monthly), and 'The American Trade Index' (monthly).

Manufactures, American. See AMERICAN MANUFACTURES.

Manumission, in Roman law, the solemn ceremony by which a slave was emancipated. Constantine the Great allowed the Christian masters to emancipate their slaves before the

altar on festival days, and especially at Easter, by placing the deed of emancipation on the head of the freedman in the presence of the congregation. See EMANCIPATION: EMANCIPATION IN LATIN AMERICA; EMANCIPATION PROCLAMATION.

Manures and Manuring. See FERTILIZERS.

Manuscripts (Latin, *manuscriptus*, written by the hand), are literally writings of any kind, whether on paper or any other material, in contradistinction to printed matter. Previous to the introduction of printing all literature was contained in manuscripts. All the existing ancient manuscripts are written on parchment or on paper. The paper is sometimes Egyptian (prepared from the real papyrus shrub), sometimes cotton or silk paper (*charta bombycina*), which was invented in the East about the year 706 A.D., and used till the introduction of linen paper, and in common with this till the middle of the 14th century; sometimes linen paper, the date of the invention of which, though ascribed to the first half of the 13th century, on the authority of a document of the year 1243, written on such paper, is nevertheless exceedingly doubtful. The earliest mention of quill pens is in the seventh century. The most common ink is the black, which is very old. The oldest, however, was not mixed with vitriol, like ours, but generally consisted of soot, lamp-black, burned ivory, pulverized charcoal, etc. Red ink of a dazzling beauty is also found in ancient times in manuscripts. With it were written the initial letters, the first lines, and the titles, which were thence called *rubrics*, and the writer *rubricator*. More rarely, but still quite frequently, blue ink is found in ancient manuscripts; yet more rarely green and yellow. Gold and silver were also used for writing either whole manuscripts (which, from their costliness, are great rarities), or for adorning the initial letters of books. With respect to external form, manuscripts are divided into rolls (*volumina*, the most ancient way, in which the troubadours in France wrote their poems at a much later period) and into stitched books or volumes (properly *codices*). Among the ancients the writers of manuscripts were mainly freedmen or slaves (*scribæ liberarii*). Some of the professional copyists in Rome were women. When Origen undertook the revision of the Old Testament (231 A.D.) St. Ambrose sent to his assistance a number of deacons and virgins skilful in caligraphy. Subsequently the monks, among them the Benedictines in particular, were bound to this employment by the rules of their Order. In all the principal monasteries was a *scriptorium*, in which the *scriptor* or scribe could pursue his work in quiet, generally assisted by a *dictator*, who read aloud the text to be copied; the manuscript was then revised by a *corrector*, and afterward handed to the *miniator*, who added the ornamental capitals and artistic designs.

It is more difficult to form a correct judgment respecting the age of Greek manuscripts from the character of the writing than it is respecting that of Latin manuscripts. In general it is to be remarked that in a Greek manuscript the strokes are lighter, easier, and more flowing the older it is, and that they become stiffer in the progress of time. The absence or presence of the Greek accents is in no respect decisive. Some Greek papyri are earlier than the Christian era, but most are not earlier than about the

6th century. The characters in Latin manuscripts have been classified partly according to their size (*majuscula*, *minuscula*), partly according to the various shapes and characters which they assumed among different nations or in various periods (*scriptura Romana antiqua*, *Merovingica*, *Longobardica*, *Carolingica*, etc., to which has been added since the 12th century the *Gothic*, so called, which is an artificially pointed and angular character); and for all of those species of writing particular rules have been established, affording the means of estimating the age of a manuscript. Before the 8th century punctuation marks rarely occur: even after the introduction of punctuation, manuscripts may be met with destitute of points, but with the words separate. Manuscripts which have no capital or other divisions are always old. The *catch-word*, as it is termed, or the repetition of the first word of the following page at the end of the preceding, belongs to the 12th or subsequent centuries. The fewer and easier the abbreviations of a manuscript are the older it is. Finally, in the oldest manuscripts the words commonly join each other without break or separation. The division of words first became general in the 9th century. The form of the Arabic ciphers, which are seldom found in manuscripts earlier than the first half of the 13th century, also assists in deciding the age of a manuscript. Some manuscripts have at the end a statement when, and commonly also by whom, they were written (*dated codices*). But this signature often denotes merely the time when the book was composed, or refers merely to a part of the manuscript, or is entirely spurious. The most ancient manuscripts still preserved are those written on papyrus which have been found in Egyptian tombs. Next to them in point of age are the Latin manuscripts found at Herculaneum, of which there is a rich collection in the Naples Museum. Then there are the manuscripts of the imperial era, among which are the Vatican Terence and Septuagint and the Alexandrine Codex of the British Museum. Since the middle of the 19th century many MSS. of Greek writings have been found in Egypt, among the chief being that containing the orations of Hyperides, several containing parts of the works of Homer, Plato, Demosthenes, etc., that in which occurs a portion of the Antiope of Euripides, and the almost complete text of Aristotle's work on the constitution of Athens. It was the custom in the Middle Ages to obliterate and erase writings on parchment for the purpose of writing on the materials anew. This custom ceased in the 14th century, probably because paper came then more into use.

Manuscripts, Illumination of. The art of illuminating manuscripts dates from the remotest antiquity. The Egyptian papyri were ornamented with vignettes or miniatures attached to the chapters, either designed in black outlines or painted in primary colors in distemper. The Greek and Roman manuscripts of the 1st century with which we are acquainted were not illuminated. The oldest ornamented manuscripts that have survived are the Dioscorides of Vienna and the Virgil of the Vatican, both of the 4th century, and having vignettes or pictures in a Byzantine style of art. The use of ornamental initial letters was introduced at an early period, and must be distinguished from the

painted pages of the Byzantine manuscripts. At first the initial letters were of the same size and color as the text, but the Syriac manuscripts of the 7th century have them with a pattern or border. They soon increased to a great size, being in some cases 24 inches in length. They were most used in the 8th and 9th centuries. They at last degenerated to the last decadence of art, the grotesque. From the 8th to the 11th century the initials in use were composed of figures of men, quadrupeds, fishes, birds, etc. The initials of the 12th century are made up of masses of conventional foliage interspersed with the animal figures of the preceding centuries. Continuous borders, with vignettes, tail-pieces, etc., were also prevalent in later times, and some manuscripts are ornamented with very artistic designs. The English and French manuscripts may be recognized by their delicate light-blue and green colors; those of Flanders by the heaviness of their drawing and the dark hues of the coloring. In Italy and Spain the tortuous patterns of animals and flowers were painted in bright colors and gold. In the early Irish manuscripts the figures are rudely drawn; the writing is large and bold, and the capitals profuse. The peculiarity of this style is the use of dots, generally in red, following the outline of the initials; delicate spiral lines, interlaced ribbons, and tessellated patterns. The most interesting specimens of this style are the Book of Kells at Dublin, and the Durham Book in the British Museum. In the 16th century the art became extinct. Some attempts have been made to revive it by adorning paper, parchment, and vellum with designs in color or metals.

Manutius, mā-nū'shī-ūs, **Aldus** (Ital. Manuzio, Manuzzi and Manucci), Italian printer: b. Sermonetta, near Bellettri, in the neighborhood of Rome (and, hence commonly known as Romanus) 1450; d. 6 Feb. 1515. He began his studies at Ferrara, and continued them at Rome where he was tutor to princely families. He learned Greek in Ferrara under Guarini and at the suggestion of the Prince di Carpi established a printing-press at Venice 1489. He gained the reputation of being learned in Greek, Hebrew and Latin and entertained in his house many scholars of the day, forming his "Neacademia" or New Academy, which later was styled "Accademia della Fama." He was the author of 'Dictionarium Græcum' (1497); 'Institutiones Græco-Latinæ' (1501-8); 'Grammaticæ Institutiones Græcæ' (1514); 'De Metris Horatiani' (1509). His son **PAULUS** (b. 12 June 1512; d. 6 April 1574) continued (1533) to manage the printing-press at Venice, and subsequently (1561) presided over the papal press, Typographia Vaticana, at Rome. He wrote a commentary to Cicero's Letters, and 'Epistolæ Selectæ.' **ALDUS**, the younger, son of Paulus (b. 13 Feb. 1547; d. Rome 28 Oct. 1597), was a scholar and author from his earliest youth. He continued his father's work at Venice and Rome. Consult: Renouard, 'Annales de l'imprimerie des Aldes' (1834); Didot, 'Alde Manuce et l'Hellénisme à Venise' (1873); Goldschmid, 'A Biographical Sketch of the Aldine Press at Venice' (1887); Omont, 'Catalogues des Livres Grecs et Latins, imprimés par Alde Manuce à Venise' (1892). See **ALDINE EDITIONS**.

Manx Cat, a breed of house-cats, originating in the Isle of Man, which are characterized

by very high hindquarters, and, as a rule, by a very short tail. See **CAT**.

Manzanillo, măn-thā-něl'yō, Cuba, city, port of entry, in the western part of the province of Santiago de Cuba, on the Gulf of Guacanabo. It has a large harbor which is protected by a number of small islands. The city is the port for Bayamo, an inland city about 40 miles east by north from Manzanillo. The low land and the mangrove swamps around the place make it very unhealthy. It is well built and has a number of fine churches, hospitals and schools,—among the schools four are high schools. Pop. 15,115.

Manzanillo, Mexico, seaport, in the state of Colima; on the Pacific at the entrance to the Bay of Cuyuttan; about 40 miles west of Colima, the capital of the state. A railroad connects Manzanillo and the capital, and the city has steamer connections with the principal ports on the Pacific coast. Pop. (1902) 4,187.

Manzanita, a popular name for various species of *Arctostaphylos* of the order *Ericaceæ*, especially *A. fungens* and *A. manzanita*, which are considered identical by some authors. They are shrubs or small trees which sometimes exceed 20 feet in height, and often form impenetrable thickets in the Rocky Mountain region from Oregon southward. They have alternate, evergreen entire leaves, usually white or pinkish flowers in long-panicled racemes and generally smooth berry-like drupes. Another well-known species often called by this name is the bearberry (q.v.), a trailing evergreen shrub which extends from the Arctic region to the mountains of Mexico, whose red berries form one of the principal foods of ptarmigan and other related birds. The great-berried manzanita (*A. glauca*), a California species, bears fruit more than half an inch in diameter. Of the 30 species of the genus, probably a dozen are used for ornamental purposes; some Central American ones in greenhouses where the climate prevents outdoor use; the shrubby western kinds in mild climates; and only the trailing kinds in cold localities. The gnarled roots are an important resource for fuel in the untimbered parts of California.

Manzano, Juan Francisco, hoo-än' frän-thēs'kō măn-thā'nō, Cuban poet: b. Havana, August 1797; d. there 1854. A negro slave he wrote and published several volumes of verse before he was manumitted (1837), gaining especial fame by 'Mis treinta Años' (1836), translated into French, German and English, and by 'Apuntes Autobiográficos,' which was never printed in Spanish, but was published in English by Richard Robert Madden in 1840 under the title 'Poems by a Slave in the Island of Cuba recently Liberated.' Manzano's other works include 'Cantos a Lesbía' (1821), several excellent lyrics reprinted in Calcano's 'Poetas de Color' (1868), and a drama 'Zafira' (1842).

Manzanos, măn-zā'nōs, a natural park, in Lincoln, Bernalillo, and Santa Fe Counties in New Mexico, southeast of Albuquerque. The Manzano Range, the highest peak of this section, numerous table-lands, and valleys, with many springs and small streams, are the chief features of this park. The Rio Grande is on the west side; the base of the mountains is about 1,000 feet above the river, and about 11,000 feet above the level of the sea. The almost perpendicular,

stupendous red cliffs which rise above the plain and form the western face of the mountains, are almost unscalable. South of the red-cliff region is the cañon of Las Moyas; and south of this cañon Bosky Peak, the highest point of the range. Near the summit of the peak is a spring which gushes up in a lake about 50 feet wide.

The view from the summit of the range at some points includes the green valley of the Rio Grande, mountains west of Albuquerque, and north to the walls of Santa Fe, and intervening valleys and mountains. On the west of the park, or the western border, are the white Manzano salt lands, on the southeast the gypsum desert. On the level mountain tops are stretches of clearing where the grass grows luxuriantly. Between Hell Cañon and Chilili is a region of immense pine and piñon forest. Some of the animals found here are deer, bear, and wild turkey. Grains, vegetables, alfalfa, fruit and other farm products are raised. Sheep, horses, and cattle are raised extensively.

Manzoni, măn-zō'nē, Alessandro, Italian poet and novelist: b. Milan 7 March 1785; d. there 22 May 1873. He studied at Milan and Pavia, and published in 1806 his poem on the death of his friend Imbonati, which was followed in 1815 by his 'Sacred Hymns' ('Inni Sacri'). In 1819 appeared his first tragedy, 'Il Conte di Carmagnola,' the first drama in which an Italian defied the unities. This play was reviewed and praised by Goethe, who took a warm interest in every subsequent production of Manzoni. The death of Napoleon inspired one of the finest odes of the century, 'Il Cinque Maggio' ('The Fifth of May'). In 1823 his second tragedy, 'Adelchi,' appeared. This, as well as its predecessor, finds more favor in the closet than on the stage. After this Manzoni divided his time between country pursuits at his residence in the neighborhood of Milan, and the composition of his romance 'I Promessi Sposi' ('The Betrothed'), a Milanese story of the 17th century, published in 1827, and which has been translated into most of the European languages (Eng. in Bohn's library 1883). He strove earnestly to make Tuscan the universal language in Italy. As a poet he outruled all his Italian contemporaries. Verdi's 'Manzoni Requiem' is a magnificent musical tribute to his memory. Consult: Sauer, 'Alessandro Manzoni' (1872); Stoppani, 'I primi anni di A. Manzoni' (1874); Bersezio, 'A. Manzoni, studio biografico e critico' (1873); Cambu, 'A. Manzoni, reminiscenze' (1885); Wailie, 'Le romantisme de Manzoni' (1890).

Maoris, mā'ō-riz or mow'riz, native inhabitants of New Zealand, a people of Polynesian race, as is attested not only by ethnological considerations but by their own legend that they came from Hawaiki (Hawaii or Samoa). Their carefully kept genealogies go back less than a score of generations, so that it seems probable that their coming to New Zealand was four or five centuries ago. Remains of a previous population with Papuan characteristics have been found. The Maoris are well built, with longer bodies and shorter legs than the European type; they have black hair, little whisker on the face, and smooth bodies, wide open, straight black eyes, heads slightly macrocephalic, the index being 77, nose straight, and color slightly brown. Their costume, no doubt adopted only upon their coming to a colder country than their early

home, was a loose garment, woven from the fibre of *Formium tenax*. Tattooing they brought with them to New Zealand and perfected it. They tattooed the face, decorating in this way the young warrior after his first successful fight, and adding fresh designs for each new exploit. They also knew how to make carvings of great delicacy, and armed themselves with stone weapons. Their religious beliefs were crude, but tinged with animism; they recognized the soul as distinct from the body and surviving it; but connected an enemy's cunning and bravery so closely with his dead body that they ate it, thus to win his warlike virtues, locating intelligence in the brain and courage in the heart. Their worship combined ancestral cult with deification of natural forces and some fetishism. They were divided into tribes, six of these representing the divisions among the original settlers. A warlike people, their chief had absolute power and could pronounce "tapu" or taboo (q.v.) at will. Before the coming of the English they were mostly vegetarian, caught some fish, lived in bark or bough huts, and made canoes. Polygamy was practised, and the *ariki*s or priest-chieftains acted as physicians, having some knowledge of herbs. Both their numbers and physique have suffered sadly since the introduction of civilization. For the history of the Maoris since British occupation, see **NEW ZEALAND, History**.

Map, or **Mapes**, māps, Walter, English scholar and poet of the 12th century. He was probably a native of Herefordshire. He studied at the University of Paris, and became a favorite at the court of Henry II. He attended the Lateran Council of 1179, and was appointed archdeacon of Oxford in 1197. Map is now generally believed to have been probably author, or in large part, author of 'Lancelot' in the Arthurian cycle. It is extremely probable, at any rate, that Map did contribute to the bringing of the cycle into its present state; but it is uncertain to what extent his work has survived. He is undoubtedly the author of a curious book 'De Nugis Curialium,' a note-book of the events of the day and of court gossip. It was edited for the Camden Society in 1850 by Thomas Wright. To Map is attributed the famous drinking-song beginning:

Meum est propositum in taberna mori.

Map. The term map is derived from the Latin word "mappa," meaning a napkin. During the Middle Ages the name "mappa mundi," signifying world napkin, was applied to geographical representations of the world on account of the fact that the maps made during that period, at least, were painted on cloth.

The object of maps and charts is to accurately exhibit to the eye by suitable methods of representation, on a reduced scale, and on a plane surface, the relative positions of points, lines, and other objects situated on the spherical surface of the earth. As commonly used the term chart is synonymous with map, but the former is usually applied to delineating the positions of the stars in the celestial vault, and to the mapping of hydrographic data, while the term map is almost exclusively applied to representations of the surface of the earth. For example, there are the "star charts" compiled and published by the various observatories, the "maps" of the

MAP

United States Geological Survey, which represent the land areas, and the "charts" of the United States Coast and Geodetic Survey, which show the depths of the waters along the coast line of the United States.

History.—The earliest maps consisted of simple drawings which merely represented the relative positions of a few known points on the earth's surface, and defined in a general way the partly known and partly conjectured limits of the land and water areas. Map making undoubtedly originated among the wandering tribes of mankind and not among those who inhabited permanent locations such as towns and villages, and were used by those tribes to perpetuate for the benefit of posterity landmarks identifying the regions travelled over by them during their wide excursions to unsettled parts of the world. This is evidenced by the well-known fact that the

of land and water areas, and the positions of roads and towns. Other ancient Egyptian maps are the route maps which were prepared under the direction of King Sesostrius, probably during the Twelfth Dynasty; certain old maps in the Alexandrian library referred to by Strabo, and probably collected by Eratosthenes; and the map on papyrus in the museum at Turin, which represents the topographical features of a gold mining district in Nubia. Maps of equal if not greater antiquity are recorded among the ancient Babylonians, who originated the idea of dividing the ecliptic into the twelve signs of the zodiac and also the sexagesimal system of numeration which led to the custom of dividing the circle into 360 degrees of 60 minutes each, with each minute subdivided into 60 seconds, and also to the corresponding divisions of the hour.

Among the Greeks, the first map appears to

Ptolemy's Map Compared with Actual Positions

American Indians and the Eskimo, and many of the Polynesian tribes, customary wanderers, are very acute in apprehending the meaning of maps, while the majority of the settled Negro tribes are absolutely lacking in this respect. It is stated that a map drawn by an Eskimo woman enabled Sir Edward Parry to discover Fury and Hecla Strait, while the experience of many pioneer surveyors and topographers, derived from their work through the extensive wildernesses of the American continent, will attest to the general accuracy of elementary Indian charts, and of the capacity of those Indians to understand the maps made by others.

Among civilized peoples, the earliest examples of maps recorded are those of the Egyptians. According to Apollonius of Rhodes (230 B.C.), the Egyptians of Colchis, a colony which dated from the time of Rameses II. (1340 B.C.), possessed maps engraved on wooden tablets which had been handed down to them from a preceding period. These maps accurately defined the limits

be that of Anaximander about 560 B.C. His work was followed about one hundred years later by that of Democritus of Abdera, whose work appears to have been based upon data obtained by himself in his travels, which extended to Persia and perhaps as far as India, and added considerably to the east and west dimensions of the known world areas. These circumstances probably led to the depiction of the world disk in the form of an oval, a distinct departure from the circular form employed by Anaximander and others. About 150 B.C., Hipparchus introduced among the Greeks the Babylonian system of numeration, and discarding the unreliable geographical data of Eratosthenes and others which were mainly obtained from travellers, suggested the use of only actual astronomical determinations of the latitudes and longitudes of the various points as the true basis for checking distances and directions. His suggestions were practically carried out by Marinus of Tyre, whose work was subsequently corrected by Ptolemy

about the second century A.D., into a map which is generally considered to be the most complete summary of geographical information prior to the sixteenth century. In this connection it is well to understand that from the time of Aristotle (384 B.C.), the mathematicians, astronomers, and geographers were well aware of the fact that the earth was a sphere and not the flat disk of the Ionic Greeks in the days of Anaximander, the ancient Egyptians, and the Babylonians. Therefore, the map making problem solved by Hipparchus, and the successful solution of which formed the foundation for Ptolemy's work, involved the devising of a projection by means of which the spherical surface of the earth could be represented on a plane surface. Although Ptolemy is credited with being the father of rational cartography, it does not appear that any maps were actually drawn by him. The oldest editions of the Ptolemaic maps on record appear to be the work of Agathodamon, a mathematician who lived in the 5th century A.D., and constructed maps accurately based upon Ptolemy's data.

Among the Romans the art of map making was confined to various kinds of sketch maps valuable for military and political purposes. They did not apply the scientific methods of the Greeks, and although both Cicero and Seneca mention general and topographical maps, and it is a fact that a survey of the whole Roman Empire was made during the reign of Augustus, the grave errors of Ptolemy's maps in all of the Mediterranean countries awaited rectification until the later Middle Ages.

Outline Sketch of Borgia Map (15th Century)

During the earlier Middle Ages, cartography together with all the other branches of scientific culture took a step backwards. The ban of the church was laid heavily on the doctrine of the sphericity of the earth and resulted in the resurrection of the ancient Greek idea of a flat circular earth surrounded by an ocean limited by the edge of the celestial vault. In this way the few maps constructed during this period assumed the form shown in the accompanying figure, and towards the close of the 14th century, the entire science of map making actually fell

below the level of that attained by the Ionic Greeks in the days of Anaximander and Democritus. It is a fact worth noting, however, that during the 13th century, a form of nautical charts called "loxodromic" or "compass" maps made their appearance in Italy and were extensively used for navigating purposes between the ports on the shores of the Mediterranean Sea. They were constructed with the aid of the compass and consisted of numerous straight lines which radiated from each port to all the other ports shown on the map. These lines marked with bearings and distances gave the ship courses between the various ports, and the maps embodied in a crude way the basic principle of modern map construction from the data obtained by the triangulations of trigonometrical surveys. With the aid of the loxodromic maps a very accurate representation of the coasts of the Mediterranean countries was obtained and served admirably to correct the errors of the Ptolemaic maps which the Renaissance had introduced once more into western Europe.

Portion of Loxodromic Map (13th Century)

The close of the 15th century witnessed a great revival in the art of map making, which was materially aided by the newly perfected arts of wood and copper engraving. Furthermore, Purbach, Regiomontanus, and others introduced trigonometry, and attempts were made to construct maps based on systematic geographical triangulations. Map making became a favorite occupation with the Germans, French, and Italians, and many valuable editions of maps were produced at Strasburg, Ulm, Basle, Cologne, Paris, Lyons, Vicenza, Venice, Bologna, and Rome, representing the work of numerous eminent map makers, among which those of Joh. Ruysch, Nicolaus Donis, and Jacob Angelus de Scarparia were of especial prominence and value.

During the 16th century the number of map makers increased greatly and brought forward such illustrious cartographers as Johann Werner of Nuremberg, Sebastian Cabot, and Gerhard Kramer (more commonly known as Mercator). The general endeavor of the Germans during this period was directed towards the improvement of the methods of projection originated by the Greeks, and led in the case of Mercator to the development of the projection which bears his name, and which is even at the present time

MAP

very extensively used in the construction of nautical maps. About the latter part of the century the centre of map making effort was transferred to Holland, mainly through the influence of the collection of maps published by Abraham Ortelius of Antwerp, under the title 'Theatrum Orbis Terrarum,' which included new engravings of the best maps from all countries. This great work passed through many editions, each successive edition being characterized by an increased number of maps. The 12th edition contained 92 maps. The earlier editions were printed in Latin, but later, editions in German, French, Dutch, Italian, and English were produced and obtained world-wide circulation.

The beginning of the 17th century inaugurated a still further improvement in the art. The

it was taken up as a governmental matter, and the original surveys, together with the maps based thereon, were executed at the cost of the state. The first step in this direction was taken by France, the object being the production of a series of maps for military purposes and as a cadastre for the land tax. For this purpose the entire country was covered with a network of triangles connecting numerous stations the positions of which were astronomically determined. The maps constructed from the data thus obtained far surpassed in the correctness of detail all those of earlier date. The example set by France has been followed by all of the first class nations of the world, and by some of lesser importance. In Europe, practically the whole continent with the exception of the Balkan States

SOLID LINES SHOW ACTUAL POSITIONS OF LAND AND WATER AREAS.

Mercator's Map Compared with Actual Positions

important inventions, such as the telescope, the sextant, and the chronometer, provided means for the taking of more accurate observations relative to time, latitude, and longitude, while the application of trigonometry to geodesy by Snellius, and Picard's measurement of a degree of the meridian between Paris and Amiens, introduced more precise methods of computation. Some of the most important productions of this epoch are those of Johann Baptist Homann of Nuremberg, and the work of Nicolas Sanson, Guill de l'Isle, and Jean Baptiste Bourguignon d'Anville and other eminent geographers of France working under the royal patronage, and Dowets Atlas published in England under the patronage of the Duke of Argyll.

These important works carry the art of map making through a period of over 200 years and bring it to a point where instead of being treated as a matter of private business enterprise,

have been surveyed and mapped at the expense of the governments of the various countries. Outside of Europe, the principal large areas covered by surveys based on exact triangulations are the United States, a part of the Dominion of Canada, the whole of British India, a portion of Asiatic Russia, and small portions of Australia, South Africa, the Dutch East Indies, and Algeria. In South America, Chili is the only country that has been completely surveyed.

The science and art of modern map construction may be considered most conveniently and usefully under three headings—*theoretical projections*, *practical methods of construction*, and *duplication or reproduction*.

Theoretical Projections.—Since the object of maps and charts is to accurately represent by suitable symbols on a plane surface the relative positions of objects, etc., on the spherical surface of the earth, the problem requiring solution is

MAP

one that is geometrically impossible, and therefore, any map, no matter how accurately constructed, must necessarily be only an approximation to the truth. Yet by the assumption of certain lines of reference which correspond to the actual latitudes and longitudes on the surface of the earth according to certain assumed or fixed geometric laws, the approximation to the truth may be so nearly attained as to be quite as useful as the truth itself for all practical purposes. Such a system of lines of reference constitutes a projection by means of which any point or line on the surface of the sphere may be plotted on the map from its known co-ordinates, or from which the co-ordinates of any plotted point may be ascertained.

There are two general classes of such projections:—the "true" or "perspective" projections which depend upon the actual position of the spectator's eye, and the "developed" projections in which the eye is assumed at the centre

cluded within the scope of their inherent characteristics. The three principal perspective projections were known to the ancients, the orthographic and the stereographic being accredited to Hipparchus and the gnomonic to Thales. The globular projection was devised by Nicolisi. They served to introduce projection methods, but with the exception of the gnomonic, which is still used for the construction of star charts and some classes of nautical charts, they have been superseded in the construction of modern maps by the developed projections.

Developed Projections are obtained by the substitution of a cylindrical or a conical surface for the ordinary plane of projection, and that surface, being subsequently developed or rolled out in a plane, gives the projection. The application of this results in two general classes of developed projections—those employing a cylinder tangent to the sphere, usually at the

Orthographic Projection on the Plane of the Equator

Orthographic Projection on the Plane of a Meridian

of the sphere, or else occupies an arbitrary position.

Perspective Projections are of three kinds: (1) the "orthographic," with the eye supposed at an infinite distance, and the plane of projection perpendicular to the line of sight; (2) the "stereographic," with the eye supposed upon the surface of the sphere and occupying the pole of a great circle, the plane of which is the plane of projection; and (3) the "gnomonic" or "central" projection, with the eye assumed at the centre of the sphere and the plane of projection tangent to its surface. To this class belongs also the globular or equidistant projection designed to avoid to a certain extent the contraction of the orthographic and the exaggeration of the stereographic projections near their respective outer edges. In this projection the eye is supposed at a distance of $\frac{1}{2}$ times the radius above the surface of the sphere. The perspective projections, in their astronomical and geographical application, are generally used for representing large areas and hemispheres, and are seldom used in the construction of maps of small extent on large scales, in which case they are too laborious of construction, and cannot be made to satisfy any special conditions not in-

cluded within the scope of their inherent characteristics. Of these, the two most commonly used at the present time are the Mercator and the polyconic projections, the former employing a tangent cylinder and the latter an infinite number of tangent cones. The Mercator was purposely designed for the use of nautical maps and is principally employed for that purpose at the present time. On a map based on this projection the loxodromic curve, that is, the course of a vessel which intersects the successive meridians at a constant angle, is represented on the map as a straight line, thus facilitating the plotting of that course from day to day during the progress of the voyage, and materially assisting in determining the true distance and bearing of the objective point. The polyconic projection appears to have been devised for the purpose of providing a suitable base for the mapping of the Atlantic coast line of the United States by the United States Coast and Geodetic Survey. The direction of this coast line being nearly diagonal to the meridians and parallels, and having a great north and south amplitude, required for its representation a projection which avoided the inherent distortions of the

various conic projections due to the great obliquity of the intersections of the meridians and the parallels in the higher latitudes. This projection on account of the close similarity of the figures on the surface of the earth to the corresponding figures on the projection, and the uniformity of scale over the whole map, is now extensively used for mapping not only areas of comparatively limited extent, but also for the representation of continental areas of large extent.

For the mathematical operations involved in the computation of the elements of these projections, and for illustrations showing how they are plotted in the actual construction of maps, see article under the title **PROJECTION** in this Encyclopedia.

Practical Methods of Construction.—As a rule, and with but a few exceptions, the drawing of an accurate map is necessarily preceded by

greatest moment, and therefore, are usually treated in the most complete manner both as to graphic effect and accuracy of information. The sketch maps are much simpler in character and represent in the most elementary way the most important features which have a direct bearing on the particular kind of military operations involved.

Many good examples of the various classes enumerated are incorporated in this Encyclopedia, a few of which may be profitably mentioned for ready reference in this connection as follows:

Geographical.—The maps of the several states and territories of the United States and the Canadian Provinces represent comparatively limited areas based on the polyconic projection, and are reproductions by the wax engraving process. The maps of the various continents represent larger areas based on the same projection,

Orthographic Projection on the Plane of a Horizon

Stereographic Projection on the Plane of a Horizon

an accurate survey of the things to be mapped, and the character of those things together with the purposes for which the survey is made, not only define the methods of surveying to be employed, but also the character of the map and its relative scale. The various methods of surveying are described under the title **SURVEYING** in this Encyclopedia. The various kinds of maps may be grouped into the following named general classes: "Geographical," "physiographical," "topographical," and "geological" maps. The representations of astronomical, hydrographical, nautical, and statistical data belong more properly to the category of charts. The various forms of railroad maps are merely diagrams only useful for consultation with the accompanying railroad schedules. The amount of distortion required to fit them for the purposes for which they are used makes them entirely unreliable for any other purpose. The military maps are of various types, and differ greatly according to the purposes for which they are used. Staff maps usually show every feature, natural and artificial, on the surface of the country mapped in the minutest detail and with the greatest accuracy. The differences of elevation of the various points are a matter of the

and have been reproduced by the same process. Several fine examples are given under the titles **AMERICA**, **EUROPE**, **ASIA**, etc. A map of the north polar region based on the simple conic projection is given under the title **ARCTIC REGION**. The map of the south polar region given under the title **ANTARCTIC REGION** is based on the orthographic projection. A map of the world based on Mercator's projection is given under the title **UNITED STATES—TERRITORIAL EXPANSION OF**.

Physiographical.—Excellent examples of this class are given under the titles **NORTH AMERICA**, **SOUTH AMERICA**, **EUROPE**, **ASIA**, and **AFRICA**. They represent the various mountain ranges, valley formations, and river systems of those important land areas. Some of the other interesting examples are the maps showing the lengths and locations of the proposed Nicaragua and Panama canals, under the title **CANALS**; the map of the Hawaiian Islands under the title **HAWAII**, and the map of the island of Luzon, under the title **LUZON**.

Hydrographical.—A type of hydrographic map of an extensive area on a small scale, and showing the form and direction of the ocean currents is given under the title **OCEAN**. An example of a small portion of a hydrographic

MAP

map such as those prepared by the United States Coast and Geodetic Survey is given under the title COAST AND GEODETIC SURVEY, METHODS AND PUBLICATIONS OF.

Topographical.—Among the best examples of modern topographical maps are those prepared by the United States Geological Survey. An example of a portion of one of these maps is given under the title GEOLOGICAL SURVEY, METHODS AND PUBLICATIONS OF. In the original map the roads, railroads, villages, towns, cities, and other artificial features are usually printed in black; the contours indicating the valleys and the hills and mountains are printed in brown; and the hydrography and river systems are printed in blue.

Geological.—The article under the title GEOLOGY gives a geological map of the United States based on the polyconic projection and reproduced in colors by the lithographic process.

Statistical.—The article under the title GEOGRAPHICAL CONQUESTS gives the maps of Africa, the North Polar Region, and North America, showing the progress of discoveries. The article under the title CARNEGIE gives a map showing

is to be reproduced. The original map should always be drawn on a scale sufficiently large to allow the draughtsman to plat the field notes easily and accurately. The difference between a large scale and a small scale and their relative effect on maps may be explained as follows: Suppose the fractional scale of a map is given as $\frac{1}{63360}$ it indicates that an interval of one inch on the map is equivalent to an interval or distance of 63360 inches or one mile on the ground. Suppose the map to be ten inches square, it would include an area of 100 square miles. Now suppose that while the size of the map remains the same the scale is reduced to $\frac{1}{100000}$, it would then include an area of 10,000 square miles. Any map scale which requires that the platting of measurements be made by the use of a scale with finer divisions than one-hundredths of an inch is about the minimum limit for platting original work, although measurements requiring an accuracy of one two-hundredths of an inch are commonly made in the construction of accurate projections for the mapping of exact trigonometrical surveys. The scale should be made larger directly in proportion to the in-

Stereographic Projection on the Plane of the Equator

Stereographic Projection on the Plane of a Meridian

the location of the libraries presented by Mr. Andrew Carnegie to various towns and cities in the United States. The title CIVIL WAR IN THE UNITED STATES includes a series of statistical maps showing the extent of the Confederate possessions during various periods of the Civil War. An interesting statistical map showing the life zones of the United States is given under the title DISTRIBUTION OF ANIMALS.

A study of these examples will afford a general idea of the most suitable treatment under the respective conditions, and the character of the data usually represented on the different classes of maps.

In the construction of original maps the principal points to be considered are the "scale," the "projection," the "topographical representation," and the method of "duplication or reproduction" for publication.

Scale.—The scale will depend upon the character of the survey and the data obtained thereby; the extent of the area to be represented on the map; and the process by which the map

crease in the amount of detail to be shown on the map. The scales for maps in railroad work should always be large—one inch to one, two, or three hundred feet. For the platting of plane table and other triangulations, and for work requiring the filling in of a great amount of topographical detail, the scale should not be less than one inch to one mile. All surveys such as the townships and sections of the Public Land Surveys, in which the measurements are made by chain or by stadia, should not be plated on a scale less than one inch to 40 chains or half a mile.

In all cases the original maps may be subsequently reduced to any desired scale by hand, by pantagraph, or by photographic methods. Reduction by pantagraph is satisfactory and useful only for the roughest classes of work. Photographic reductions of maps of limited size and prepared as copies for engravings, may be made with fair accuracy and very slight distortion. Map sheets exceeding 15 to 20 inches square in the size of the final reduction

cannot be reduced photographically with sufficient accuracy to satisfy the demands of absolutely accurate copper, steel, and stone engravings. For such engravings the reductions should always be made by hand. The method of hand reduction usually employed is the simple but effective one of dividing the original and the copy into a system of equivalent squares and then drawing in all the details by hand. The very simplicity of the method demands the services of the most skillful and experienced draughtsmen, so that the resulting maps possess a far greater accuracy than any reductions that may be obtained by photo-mechanical methods. There are examples of hand-made maps in the office of the United States Coast and Geodetic Survey which are actually superior in accuracy, execution, and beauty, to the prints from the very fine copper engravings for which they served as a copy.

If the maps are to be reproduced by being engraved on copper, steel, or stone, the reductions furnished the engravers should always be upon the "final scale" or scale of publication. This is also applicable to wax engravings when photographic methods of reduction are not available to the engraver. When the maps represent a great diversity of physical characteristics, it is convenient to avoid confusion of details by using various conventional colors so as to distinguish the land from the water areas, the rivers and creeks from the roads, railroads, contour lines, etc. If the maps are to be reproduced by any of the photo-mechanical processes such as photo-engraving, photo-lithography, or the half-tone process, the use of colors should be strictly avoided, and the map made in black and white on a scale that will allow about a one-third reduction to the scale of publication.

Projection.—At the present time the construction of the basic projection for a map is a very simple matter, and consists merely in the laying off of the proper tabular values which have been computed for the use of map draughtsmen. The most useful tables of this kind in this country are those published by the United States Coast and Geodetic Survey, and the Hydrographic Office of the Navy Department. The Mercator and the polyconic are the two principal projections employed at the present time, but many others are often employed where their special characteristics satisfy the particular requirements of the maps. It is in such cases that an intimate knowledge of the various projections is valuable to the map maker.

For information relative to the particular characteristics of the various projections see article under the title *PROJECTION*.

Topographical Representation.—The differences of elevation between the various points on the surface of any region, that is, the hills, mountains, and valley formations together with other natural features such as the river systems, plains, tablelands, etc., constitute the topography of that region. The term "orography" is applied to the aspect furnished by those natural features the existence of which are due solely to differences of elevation—the valleys, hills, and mountains. These are represented on maps either by a system of horizontal lines drawn at right angles to the slopes called "contours," or by a system of vertical lines called hachures which follow the directions of the slopes and are

drawn at right angles to the "contours." The best idea of the nature of contours may be had by supposing a dam built across a river and flooding the country above it. Suppose the height of the dam to be increased at uniform intervals of 10 feet. At each increase in the height of the dam the water will reach a new level, and the irregular horizontal line where it intersects the surface of the ground is the contour for that particular height of the dam, and connects all the points of the same elevation on surface of the whole region. In the actual determination of contours the datum, zero, or point of beginning of the vertical intervals is the level of the sea, and the value of an interval adopted—10, 20, 50, or more feet—depends upon the purpose for which the survey is made, and the scale of the final map. In surveys for hydraulic purposes such as the construction of dams and reservoirs, the laying of water and sewer systems, and the digging of canals, many cases occur which require the adoption of a contour interval as small as one or two feet. In such cases the areas surveyed are small and are mapped on a large scale. On the other hand, when the areas are large with great differences of elevation, larger contour intervals are adopted, and the maps are made on a small scale. The maps of the United States Geological Survey are among the best examples of orographic delineation by the method of contours, for detailed information of which see article under the title *GEOLOGICAL SURVEY*.

The delineation of orographical features on the more accurate and useful classes of maps by the method of hachures is now being rapidly supplanted by that of contours. The only practical value of the former lies in its pictorial effect, and that, when viewed from the standpoint of usefulness, fails to compensate for the enormous expenditure of labor and time in the execution of the maps and the subsequent engravings. The most beautiful examples of this class of maps in the world are those that have been published from time to time by the United States Coast and Geodetic Survey, but even in the work of that bureau, the method of hachures is being slowly supplanted by the method of contours.

Duplication or Reproduction.—Maps are duplicated or reproduced for publication by being engraved by hand on copper, steel, stone, wood, and wax. Wood engravings, however, are very rarely made at the present time. Maps are also reproduced quite extensively by the photo-engraving and the photo-lithographic processes. The finest classes of engraved maps, like those of the United States Coast and Geodetic Survey, are impression prints taken directly from the engraved plate by means of hand presses. In this bureau the engravings are made exclusively on copper plates. The maps of the United States Geological Survey, which represent the finest class of lithographed maps in this or any other country, are engraved on stone, from which impression prints are taken on hand presses and transferred to smooth stones from which the final prints are made on power-driven cylinder presses. A great many of the maps which make up the best classes of atlases published for scientific and other purposes in foreign countries are reproduced in the same manner. In the United States the commercial maps are mostly

MAPES — MAPLE

reproduced by the wax engraving process. This process has now become one of the most important methods for reproducing not only maps, but also for the reproduction of any subject in line, such as statistical diagrams, architectural plans, mechanical drawings, etc., for the illustration of books, magazines, and catalogs.

For detailed information relative to the various processes enumerated, see articles under the titles, ENGRAVING, LITHOGRAPHY, PHOTO-ENGRAVING, PHOTO-LITHOGRAPHY, and WOOD-ENGRAVING.

For further detailed information on maps and map making methods consult the following authorities: Craig, 'A Treatise on Projections' (U. S. Coast and Geodetic Survey, Washington 1882); Gelcich and Sauter, 'Kartenkunde geschichtlich dargestellt' (Stuttgart 1897); Gretsche, 'Lehrbuch der Kartenprojektion' (Weimar 1873); Verner, 'Map Reading and Elementary Field Sketching' (London 1893); Zondervan, 'Allgemeine Kartenkunde' (Leipzig 1901); West, 'The Elements of Military Topography' (London 1894); Woodward, 'Geographical Tables' (Washington 1894); Steinhäuser, 'Grundzüge der mathematischen Geographie und Landkartenprojektion' (3d ed., Vienna 1887); Fiorini, 'Le proiezioni delle carte geografiche' (Bologna 1881); Cebrian and Los Arcos, 'Teoria general de las proyecciones geograficas' (Madrid 1895); Tissot, 'Mémoire sur la représentation des surfaces et les projections des cartes géographiques' (Paris 1881).

WILLIAM MOREY, JR., C. E.,

Consulting Engineer, New York City.

Mapes, *māps*, **Victor**, American playwright: b. New York 10 March 1870. He was graduated from Columbia in 1891, was Paris correspondent of the New York *Sun* 1892-6, and dramatic critic of the New York *World* 1898-9. He has written 'Duse and the French' (1897); and among plays by him may be named: 'A Flower of Yeddo' (1898); 'The Tory's Guest' (1900); 'Don Caesar's Return' (1901).

Maple, a genus (*Acer*) of trees, together with a few shrubs of the order *Sapindaceae*; or according to some botanists, the type genus of the order *Aceraceae*. The species, of which there are nearly 100, are indigenous to the North Temperate zone, being most numerous represented in China, Japan, the United States and Canada. They are characterized by opposite, palmate or lobed, exstipulate leaves; small polygamo-dioecious flowers in axillary corymbs or racemes; and compound, one- or two-seeded, long-winged nuts (samaras). The maples constitute one of the most widely useful genera of trees, being extensively employed for ornamental and street planting, for wind-breaks, while the wood serves well for tool-handles, furniture, flooring, and many other purposes. As fuel, they are especially valuable, being considered superior to almost all other woods except hickory. Because of their popularity for ornamental planting a great number of horticultural varieties have been produced, especially in Japan, and nearly all, but particularly the Japanese and American species and varieties, are noted for their brilliant autumnal colorings, which in the various shades of yellow and red are unequaled by any other group of northern trees. The flowers are rich in nectar and are sought by bees. Most of the species thrive best upon rich moist

land suitable for agricultural purposes and are considered an indication of the type of soil. A few grow in wet land, and many upon mountain sides. They are readily propagated by means of seeds which, in the case of the early maturing kinds, should be sown as soon as ripe, the later ones in autumn or spring, being stratified in sand during the winter. Some choice varieties are grafted or budded and others may be increased by cuttings and layers.

In America, the best known, most widely planted and otherwise most important species is probably the rock or sugar maple (*A. saccharinum* or *A. saccharum*), a stately round-headed, gray-barked tree often attaining heights of 120 feet. It is especially characteristic of rich woods from Maine to Michigan and southward in the mountains to Georgia, everywhere being noted for the surpassing splendor of its leaves in autumn. Besides great popularity for all the purposes mentioned above, some of its specimens are highly prized for their wavy grained wood, which being of satiny appearance and capable of high polish is used under the name of curly maple often as veneers for choice furniture. It is further the most important of the species which yield a saccharine sap, and is a chief source of maple syrup and sugar, to obtain which the trees are "tapped," the sap caught in buckets and evaporated. A yield of three pounds annually is considered very profitable; six pounds or even more is often obtained from many specimens whose sap is either especially abundant or particularly rich in sugar. If properly done no injury results to the trees. One of its varieties, the black maple (*A. saccharinum*, var. *nigrum*) so called from the color of its very dark-colored bark, is considered a distinct species (*A. nigrum*) by some botanists. It has the same range and habitats as the preceding and in nearly every respect the same uses, including sugar production. This form is more abundant than the preceding in the Central States.

The silver maple (*A. dasycarpum*; or according to Linnæus, *A. saccharinum*) is a widely spreading tree which attains a height of 120 feet throughout the same range as the above species. Being very ornamental in form and particularly also because of its graceful leaves, which are silvery white beneath, this tree is widely planted where rapid growth and quick effects are desired. Its chief fault is its brittleness; it quickly succumbs to high winds. It will succeed upon a wide variety of soils. Its sap, though rather sweet, is less useful for sugar than the above mentioned species.

The red, scarlet or swamp maple (*A. rubrum*) attains heights similar to the above, has about the same range, but is most frequently found in wet ground. It is named from the brilliant color of its flowers, which are borne profusely in early spring before the leaves appear and its red fruits which appear soon after. Being of good habit it is widely planted for ornamental purposes upon all kinds of soils. Its wood is used for most of the purposes enumerated above.

The Norway maple (*A. platanoides*) is somewhat smaller than the preceding species, being more compact and umbrageous. It is widely planted in private grounds and in parks, but is less valuable for street planting than the above because of its shorter trunk. It is a native of

MAPLE SUGAR INDUSTRY

Europe. The sycamore maple (*A. pseudo-platanus*) another European species is smaller still, attaining only about 70 feet. It is also widely planted in America as well as in Europe, being a vigorous, rapid grower and succeeding upon a great variety of soils. The common maple (*A. campestre*) occasionally attains 50 feet, but is usually a smaller tree or even a shrub. It is of European origin and is widely planted.

The Japanese maples (*A. japonicum* and *A. palmatum*) are both small trees or shrubs which because of the great diversity of form of their leaves, and their dainty habit have become widely popular in the parks and gardens of the United States and Europe. Their exceptionally brilliant autumnal coloring is taken advantage of in Japan where in the fall they approach the chrysanthemum in popularity.

There are many other species but these are the most important. Another group, the ash-leaved maples, are generally grouped under the generic name *Negundo*. The best known representative is the box-elder (*A. negundo* or *Negundo aceroides*), which is widely planted in the Western States for wind-breaks and shelter belts and for fuel.

The maples furnish food for a large number of insects, some of which live upon the green parts, and others upon the wood. Several species of scale insects (q.v.) are often abundant enough to do considerable damage. The cottony maple scale (*Pulvinaria innumerabilis*), *Pseudococcus aseris*, a European insect, and the "gloomy" scale (*Aspidiotus tenebrosus*), a southern species, are among the most troublesome. Several caterpillars live upon the leaves, the forest tent caterpillar (*Malacosoma disstria*), the fall web-worm (*Hyphantria cunea*), and the larvæ of the tussock moth (*Orgyia leucostigma*), being the most generally important. The maple worm (*Anisota rubicunda*) is frequently very destructive. It is the larva of a moth. Of the borers, the larvæ of *Dicerca diversicata*, and *Glycobius speciosus*, which are beetles in the adult state, and those of *Ægeria aceris*, a clear winged moth, are among the best known. The second beetle mentioned is known as the sugar maple borer. Consult: 'Bailey, Cyclopedia of American Horticulture,' New York (1900-2).

Maple Sugar Industry, a trade term, in common use, pertaining to the manufacture of sugar and syrup from the sap of rock or sugar maple, *Acer saccharinum*. This production is classed under "Agriculture" by the United States Census Bureau, and note was made of its importance at a very early day in the history of the government. The product is strictly confined to North America, and the greater part to more or less limited areas in each of the geographical divisions known as New England, the Middle and Central-Western States, and Canada bordering on the North. Twenty-three States reported maple sugar or syrup in 1900. Of the 11,928,770 pounds of sugar made that year in the United States, 87.8 per cent, or 10,478,240, were produced in the North Atlantic States. The three States of Vermont, New York, and Pennsylvania reported over 80 per cent of the total. On the other hand, the States of the North Central division were credited in 1900, with 1,211,334 gallons of syrup, out of a total of 2,056,611 for the entire country. In this division the great maple sugar producing States

of Ohio, Indiana, Michigan, and Wisconsin are included. The importance of this industry may be inferred by the tables following, taken from the census years noted,—the five States reporting the greatest production in 1900, being arranged in order of precedence and compared with the total manufacture:

POUNDS OF SUGAR.			
STATES	1900	1890	1860
Vermont.....	4,779,870	14,123,921	9,897,781
New York.....	3,628,540	10,485,623	10,816,419
Pennsylvania.....	1,429,540	1,651,163	2,767,325
Ohio.....	613,890	1,575,562	3,345,508
New Hampshire....	441,870	2,124,515	2,255,012
Total.....	10,893,810	29,960,784	29,082,045
Total, U. S. A.....	11,928,770	32,952,927	40,120,205

GALLONS OF SYRUP.			
STATES	1900	1890	1860

Total.....	1,837,469	1,738,404	925,826
Total, U. S. A.....	2,056,611	2,258,376	1,597,589

It is estimated that it costs 5 cents per pound to manufacture maple sugar or syrup. On this basis the cost of syrup will average 55 cents per gallon. In 1900 the valuation reported was: sugar, 9 cents per pound; syrup, 76 cents per gallon. In Canada the manufacture of maple sugar and syrup has assumed a relatively high importance compared with the production in the United States. The Dominion census of 1901, gives the entire volume as 17,762,636 pounds (syrup being reduced to equivalent pounds of sugar for the purposes of this enumeration); and, of this aggregate, the Province of Quebec is credited with 13,643,672 pounds of maple sugar, the Province of Ontario following with a production of 3,791,598 pounds. Maple sugar is reported from other provinces and territories as follows: New Brunswick, 207,450 pounds; Nova Scotia, 112,496 pounds; Manitoba, 5,137 pounds; Northwest Territories, 1,243 pounds Prince Edward Island, 1,009 pounds; British Columbia, 31 pounds. The average value of this maple sugar and syrup is 10 cents per pound.

History.—Maple sugar and syrup was made at an early day by the pioneers of New England and Canada. It may have been a product of "necessity, the mother of invention," or an inheritance from the Indians, who had a spring-date of *sugar-making moon*; but, in either event, the first methods employed were crude, and the article was dark in color and not attractive. Moreover, tapping trees with an axe tended to denude the forest of its maples, and the whole *modus operandi* was wasteful in the extreme. The sap was caught in troughs, hewed out of logs, thence carried in pails to the boiling-place, and reduced to syrup in potash kettles. These kettles of the 18th century, or earlier, would be a curiosity at this day. They were suspended by chains from a horizontal pole, supported by forked or crossed sticks at each end, and surrounded by a blazing open fire. The camp-kettle, captured from General Burgoyne at the Battle of Saratoga, 17 Oct. 1777, preserved in the Bennington Battle Monument, is a fine illustration of what these kettles resembled. Primitive ways, however, did not long continue. Improved methods, both as to tapping the

maples,—leading up to the use of metal spouts, —and refining sap, followed one another, until now, modern scientific principles prevail; and it is possible to reduce the sap to sugar or syrup, using evaporators, almost immediately, so that its color is nearly white, flavored only with the delightful aroma of the maple.

Production and Adulteration.—The demand, in the United States, being many times in excess of the natural production, maple sugar and syrup must be considered a luxury. This fact has led to the "manufacture" of an article of commerce in which the pure maple product plays a very inconsequential part. Good authorities assert that sugar refiners make much more sugar and syrup, labeling it "maple," than the entire natural production; that the refuse sugar of the real maple enters into the artificial combination of glucose, cane or beet sugar, and chemicals,—to a very large degree creating a ready market for black American and Canadian sugars, and the "late runs" of the maple sugar-producing sections of both countries.

Maple Sugar Makers' Associations.—In the more important States, organizations have been formed for the mutual protection of common interests. These associations comprise in their membership the larger producers of maple sugar, and not infrequently, include State officials and their respective delegations in Congress. Influenced by these representatives of material interests to State and Nation, the United States government, through its Department of Forestry, has instituted a series of experiments for the purpose of fostering the maple sugar industry of the United States; to devise means for a more successful propagation of the sugar maple, and to enhance the quantity, quality, and value of the "orchards" now in existence.

H. L. STILLSON.

Mapleson, mā'pl-sōn, James Henry, English operatic impresario: b. London 4 May 1830; d. there 14 Nov. 1901. He was educated at the Royal Academy of Music, London, and went to Italy for vocal instruction, but was compelled to abandon his career as a singer, owing to throat trouble. He then entered an orchestra, playing the viola and in 1861 he became manager of the Lyceum Theatre. In 1862 he assumed the management of Her Majesty's Theatre where he made himself famous. In 1871, after the burning of Her Majesty's Theatre he managed Drury Lane but returned to the new Her Majesty's upon its completion. In 1878 he conducted the tour of an Italian opera in America and subsequently made tours with the greatest singers of the day, including Patti, Nilsson, etc.

Mapurito, mā-poo-rē'tō, one of the Mexican white-backed skunks. See SKUNK.

Maqui, mā'kwē, an evergreen shrub of the linden family found in Chile, from the juice of whose acid fruit the Chileans make a wine given to persons ill with a fever. Its wood is employed in making musical instruments, and its bark furnishes strings for them. It is the best-known species of the genus *Aristotelia* (*A. maqui*), and is cultivated as an ornamental shrub in Europe.

Maquoketa, mā-kō'kē-tā, Iowa, city, county-seat of Jackson County; on the Maquoketa River, and on the Chicago, M. & St. P. and the Chicago & N. W. R.R.'s; about 40 miles

northwest of Clinton and 30 miles south of Dubuque. It is in an agricultural section; valuable limestone quarries are in the vicinity, and not far distant are forests which furnish excellent hardwood timber. Its chief manufactures are flour, lime woolen goods, brick, tile, foundry and machine-shop products, and wooden-ware. It has an extensive trade in manufactured articles, farm products and live-stock. It has county buildings, several churches and schools, and the Boardman Library Institute. The city owns and operates the water-works. Pop. (1900) 3,777.

Mara, mā'ra, in old Runic, a goblin that seized on men asleep in their beds, and took from them all speech and motion. In Russian it was called *kiki-mora*, or ghost. Mara is another representation of incubus or nightmare (q.v.).

Marabou, mār-a-boo', a large African pink-white pouched stork (*Leptopilius crumenifer*), which resembles the adjutant (q.v.) of India in appearance and habits. It gives its name to the soft and drooping feathers (coverts) which cover the root of the tail and are prized for millinery and other ornamental purposes; a large part of the "Marabou feathers" sold, however, are derived from the Indian adjutant.

Marabouts, mār'a-boots, Maraboots, or Marabuts, an Arab tribe of religious devotees, saints or sorcerers, who are held in high estimation, and who exercise in some villages a despotic authority. They distribute amulets, affect to work miracles, and are thought to exercise the gift of prophecy. Throughout the Barbary States the tombs of the Marabouts are conspicuous objects, being generally built in the open country, and regarded by the people with much reverence. The living Marabouts are regarded by foreigners as little better than vagabonds.

Maracaibo, mā-rā-kī'bō, Venezuela, capital of the state of Zulia; situated on the western shore of Lake Maracaibo; has a large and safe harbor; and maintains commercial relations with foreign markets, with the interior, and with Colombia. The Red "D" Line Steamship Company, of New York, sends a vessel on regular trips to Maracaibo, and hundreds of small craft, suitable for shallow waters, carry on the trade of the coast and rivers tributary to the lake. This city is also the starting point for passenger and freight steamers and the railway lines of sections of the state of Los Andes. The most important buildings are the Executive Mansion, the public market, Legislative Palace, Municipal Building, Baralt Theatre, University, six churches, and the new jail. There are 5 hotels, 2 clubs, 24 restaurants, etc. The public plazas contain statues of the patriot, Gen. Rafael Urdaneta, and Don Rafael Baralt, author of a history of Venezuela, who was born in Maracaibo and became a member of the Royal Spanish Academy. There is a dockyard for the construction of sailing-vessels, and the city has electric lighting, telegraph and telephone service, submarine cable, street railways, etc. In 1901, its exports were: coffee, 25,626,000 kilos; cocoa, 154,000 kilos; hides, 456,000 kilos; deer and goat skins, 147 tons; copiba, 41 tons; fustic, 6,272 tons; dividivi, 3,368 tons; brown sugar, 283 tons; fish sounds, 36 tons. The number of vessels entering this port in the year

MARACAIBO — MARATHON

just mentioned was 431. Maracaibo, at first called Nueva Zamora, was founded in 1571 by Alonso de Pacheco. The population in 1899 numbered more than 35,000.

Maracaibo, Gulf of. See VENEZUELA, GULF OF.

Maracaibo, Lake of, Venezuela, in the northwestern part, connected with the Gulf of Venezuela by a strait about 50 miles long and from 8 to 15 miles wide. The lake is about 100 miles long and 80 miles across the widest part. At the mouth it is about 500 feet deep, but at its head it is shallow and the land near the shore is marshy. Large vessels cannot enter because of a bar at its mouth which leaves only from 8 to 13 feet of water. A number of rivers flow into the lake and keep it fresh, but when strong north winds prevail it becomes brackish. The tides do not affect the lake to any very great extent although it is a marine inlet. It was once much larger than at present, as the shore-marks indicate, but the basin has been filled in leaving this one large lake and a number of smaller lakes which are connected by creeks. See also VENEZUELA.

Marajo, mã-rã-zhō', Brazil, an island at the mouths of the Amazon and Para rivers; area, about 18,000 square miles. The greater part is low, in the centre are several lakes. In the north and west are swamp lands and in the east and south forests, the rubber tree predominating. The chief settlement is Sauré on the eastern coast. There are not many residents, as in the rainy season nearly the whole island is flooded. Cattle raising and gathering rubber are the chief occupations.

Maral, the red deer of Persia.

Maranhãṁ, mã-rãn-yãn, or **Maranhão,** Brazil, a maritime state, bounded on the north by the Atlantic Ocean; area, 177,566 square miles. The surface is uneven, but there is no range of mountains. There are numerous rivers flowing into the Atlantic, large forests, extensive plains where cattle are reared; the climate is fine, and the soil fertile. Paranaíba is the principal river. Agriculture, however, has not prospered here, and the emancipation of the slaves, on whose labor the state had depended, was followed by a period of great depression. Cotton, sugar, and rubber are the principal products. Coffee, rice, corn, cacao, and tropical fruits grow luxuriantly. The population is not great enough to properly develop the rich natural resources. Efforts are being made to colonize different sections. The present inhabitants are chiefly of Portuguese descent; but there are about 20,000 Indians and a few hundred negroes and mulattoes. The capital is Maranhãṁ. Pop. (1900) 459,762.

Maranhãṁ, or São Luiz De Maranhão, sãṁ loo-êzh' dô mã-rãn-yãn', Brazil, capital of the State of Maranhãṁ; on an island on the bay of São Marcos, and between the mouths of the Itapicuré and Meirim rivers. The first settlements were made by the French in 1672. The ground is low and the climate warm but the place is healthful. The harbor, once good, is filling with sand, and little or nothing is done for its improvement. It has considerable trade; the chief exports are cotton, sugar, hides, rubber, cotton-seed, and the skins of goats. The chief imports are cloths and clothing. The city has

many fine buildings, public and private. Pop. including the suburbs, about 40,000.

Maranhão. See MARANHAM.

Maraschino, mār-ās-ké'nō, or **Marasquino,** a fine liqueur prepared from the sour cherry of southern Europe (*Prunus mahaleb*). The best-known kinds come from Dalmatia, and from Corsica. An inferior kind is made in Germany.

Marat, Jean Paul, zhôn pôl mã-rã, French revolutionist: b. Boudry, Neuchâtel, Switzerland, 24 May 1744; d. Paris 13 July 1793. He studied medicine in Paris, traveled widely, and practised in London and later in Paris. The first breath of the Revolution converted the industrious doctor into an audacious fanatic and demagogue. He succeeded, by his violence and energy, in commanding attention. Danton instituted the club of the Cordeliers, and collected around him all the fiercest spirits; among the number, Marat, who became the editor of the 'Publiciste Parisien,' better known under its later title 'L'Ami du Peuple,' again changed to the 'Journal de la Republique Française.' This sheet was the oracle of the mob. Denounced to the constitutional assembly, and proceeded against by the municipal authority of Paris, he contrived to escape to London and was later in hiding in Paris. During the existence of the legislative assembly he continued his outrages, figured among the actors of 10 August, and in the assassinations of September (1792). He was a member of the committee of public safety to the convention and made the ministers, General Dumouriez, and the Girondists, the objects of his attack. Being charged in the convention with demanding in his journal 270,000 heads, he openly boasted of that demand, and declared that he should call for many more if those were not yielded to him. The establishment of the revolutionary tribunal and of the committee for arresting the suspected, was adopted on his motions. On the approach of 31 May, as president of the Jacobin Club, he signed an address instigating the people to an insurrection, and to massacre all traitors. Even the Mountain party denounced this measure and Marat was delivered over to the revolutionary tribunal, which acquitted him; the people received him in triumph, covered him with civic wreaths, and conducted him to the hall of the convention. His bloody career was closed by assassination. (See CORDAY, CHARLOTTE.) His remains were placed in the Pantheon, whence they were later removed. Consult Chevreumont, 'Jean Paul Marat' (1881); Bat, 'Jean Paul Marat, the People's Friend' (1901).

Marā'thi. See MAHRATTAS.

Marathon, mār'a-thôn, Greece, an ancient village in Attica, about 20 miles northeast of Athens. It was situated on a plain which extends for about 6 miles along the sea shore, with a breadth of from 1½ to 3 miles. The site of the ancient village was not probably that of the present Marathona, but at a place now called Vrana, a little farther south. Through the centre of the plain runs a small brook. Here was fought the great battle between the Athenians and Persians, 490 B.C. (See MILTIADES.) A tumulus or "soros" on the plain, marks the burial-place of the Athenians who died in battle. It was excavated by the Greek Archaeological Society in 1890-1, and yielded many interesting relics.

Maratti, mǎ-răt'tē, or **Maratta**, mǎ-răt'tā, **Carlo**, Italian painter and engraver: b. Camerino 13 May 1625; d. Rome 15 Dec. 1713. While a child he amused himself with painting all sorts of figures drawn by himself on the walls of his father's house. In his 11th year he went to Rome, studied the works of Raphael, of the Caracci, and of Guido Reni, in the school of Sacchi, and formed himself on their manner. His Madonnas were particularly admired. Louis XIV. employed him to paint his celebrated picture of Daphne. Clement IX., whose portrait he painted, appointed him overseer of the Vatican gallery. We are much indebted to him for the preservation of the works of Raphael in the Vatican, and of the Caracci in the Farnese Palace. He also erected monuments to those masters in the church della Rotonda. As an artist Maratti deserves the title given him by Richardson, of the 'Last Painter of the Roman School.'

Maratt'ales. See FERNS AND FERN-ALLIES.

Maravedi, mǎ-r-a-vă'dī, a name given to old Spanish copper coins in use from 1474 to 1848, varying in value from 1-7 to 1-3 of a cent. There were also, at an earlier period, maravedis of gold weighing 60 grains.

Marbeau, Jean Baptiste Firmin, zhôn băt-tēst fēr-mǎn mǎr-bō, French philanthropist, founder of the day-nursery: b. Brives 18 May 1798; d. St. Cloud 10 Oct. 1875. He practised law in Paris, and in 1841, being deputed to inspect the charitable institutions of the first arrondissement of the city, planned the crèche or day-nursery for the care of children of working mothers. The first crèche was opened 14 Nov. 1844 at Chaillot; a Société des Crèches was founded in 1846; and his plan was described in his book, 'Des Crèches' (1845). Marbeau played a less prominent part in other charities and wrote on various problems of pauperism. Consult the life by Roussel (1875).

Mar'ble, mǎr'bl, **Manton**, American journalist: b. Worcester, Mass., 16 Nov. 1835. He was graduated from the University of Rochester in 1855 and engaged in journalism in Boston where he was on the staff of the *Journal* and later on that of the *Traveller*. In 1858 he went to New York and was on the editorial staff of the *Evening Post* and in 1862-76 was owner and editor of the *World*. He was a member of the Bimetallic Congress in Europe in 1885 and is the author of 'A Secret Chapter of Political History' (1878).

Marble (from the Greek *marmairein*, to sparkle), a compact rock which, in its pure form, is composed entirely of carbonate of lime or limestone. In its best form it is a variety of calcite, the tiny crystal facets sparkling and flashing in the sun's rays; hence its ancient name. It is seldom found in perfect purity, the tractable qualities of the limestone allowing the introduction of many foreign substances during its formation. Thus there will be seen marble with streaks of various colors running through it, caused by the action of oxide of iron or other chemicals. Almost any limestone rock is commonly called marble, even certain varieties of granite, onyx, porphyry and rock largely composed of gneiss and mica-schist.

Marble has been a favorite stone for forming into statuary and for decorative work in buildings and monuments, from the very earliest ages.

The Greeks, who were the first to endow this lifeless stone with marvelous genius in their statuary and bas-reliefs, were blessed with an almost inexhaustible supply of the very finest and purest marble yet discovered, on the island of Paros, in the Ægean Sea. This marble, so celebrated as "Parian," possesses a peculiar waxy attribute which gave the statues formed from it a beautiful polish. The 'Venus de Medicis' was made from this stone, which is almost perfectly white. The Parthenon was built of marble of Pentelicus, which was a little more finely grained. The marbles of Carrara were even then known but not generally put in use till later years, being still among the finest marble in the world, though having some gray streaks.

In many other parts of Continental Europe and in Great Britain are quarries of fairly pure marble. In America, however, will eventually be found the finest supply of this useful stone in the world. Each year new jettings of it are found in wild parts of the Rocky Mountains, some of them pure white, while others are limned with variegated colorings, rivaling a rainbow in brilliancy. Perhaps the finest example of these wonderful marbles of the Rockies is found in the new State Capitol building of Colorado, at Denver. The geologists of that State have been unusually energetic in discovering useful minerals in their mountains and have incorporated in the Capitol many of them. Walls, exterior and interior, are composed of richly grained granites and marbles, more beautiful and rare than any even dreamed of by the ancients. In the same slab of stone can often be seen a variegation of lines and hues, ranging from the purest white, with sparkling granular crystals of calcite, to delicate grays, limpid blues, vivid reds and velvety onyx. To reproduce this celebrated structure in any other part of the world would be a labor almost impossible of accomplishment and infinitely costly. In the eastern part of the United States there are many quarries of marble which have been in use for many years. Vermont is probably the seat of the largest quarries. Little of this marble is finely grained and white enough to answer for the sculptor's use, but it is admirably adapted for ornamental purposes in architecture and for monuments for the dead. American sculptors still generally use the marbles from Carrara, though the merits of the American product are becoming known. Vermont, although one of the smallest States in the Union, exports more stone for commercial purposes than any other State, except one, Pennsylvania standing first. The money value in 1903 of Vermont's stone product was in excess of \$6,000,000, a large part of it being in marbles of various grades.

The quarrying of marble is now carried on extensively, the use of machinery largely taking the place of the ancient hand methods. Fifty years ago the quarries of Rutland, Vt., still the largest in the world, were operated by ox teams, and hand work of the crudest form. Today, these vast quarries have an extensive outfit of electric cranes and derricks, which move the blocks of marble in any desired direction, easily and quickly, one of these traveling cranes having a carrying capacity for 100,000 pounds. The stone is too easily broken to permit the use of blasting powders of any kind. This method is used in some of the Italian quarries, but causes great waste of material and is most unsatisfac-

tory. In the Vermont quarries, a machine called a "channeler" has been found the best for economical work, and has been exclusively adopted for about ten years. It consists of a row of long chisels set in a strong, traveling framework. This gang of chisels vibrate up and down, cutting a channel in any direction desired in the face of the marble ledge. The channel can be made any reasonable depth, according to the size of block desired. When this channel, or groove, is sufficiently long and deep, the machine is reversed and cross channels are cut and the bottom perforated. Then wedges are carefully driven in behind the block of stone and it gently falls over, to be lifted by a crane to the railroad cars or to that part of the quarry devoted to further treatment of the output. As a rule, the stone is sent in its rough state to the purchaser, who dresses it himself. When the order is for monument work or some special design in architecture, the marble is treated at or near the quarry. In thus further treating the product, a toothless saw, or gang of saws, is used. The block of stone is placed on a horse, or platform, and the saws set at work, the size of the cut being gauged by setting the saws close together, or far apart, as needed. A stream of water in which is mixed sea sand or other sharp, hard sand, falls upon each saw. The friction of the iron blade, aided by the sand and water, quickly cuts up the marble into any desired shape. Some marble cutters use saws of wire, but the best seem to be those made of strips of soft iron one sixteenth of an inch thick and, when new, four inches wide. The marble wears down one of the saw blades very rapidly. When the blocks are thus sawn into the requisite shapes by the power gang-saws, they are then placed on tables and ground down to size, a small piece of marble being rotated over them by hand or power, water flowing over the surface being ground. With surprising facility, the marble yields to this treatment. Polish, in the final stages, is given by rubbing with wood or other soft material, and finally cloth. Much hand work is, of course, necessary with the mallet and chisel and polisher, but all the rough, heavy work, which formerly made marble so costly and hard to obtain, is now done entirely by electric and steam power. One of the finishing rooms at the Rutland works, located at Proctor, Vt., is 1,000 feet long and contains scores of giant gang saws, cutting up the marble into various shapes. This one plant, the largest in the world, has an output of \$3,000,000 annually, and employs hundreds of men. Most of this output is of white marble, though brown, gray, green and other shades are found in profusion.

One ancient method of mining this delicate stone, still used entirely by the Mexicans in mining onyx, is to drill holes in a line, insert plugs of some porous wood, pour in water and allow the wood to swell. This gently forces the precious stone free, without the least injury.

One quality of marble, not usually recalled, is its ability to withstand great heat safely. In the devastating fire in 1903 at Paterson, N. J., buildings built of granite crumbled and perished. Those of marble still stand, almost as good as ever. Its use is therefore becoming more and more general in erecting fireproof buildings in the large cities, the floors and often the entire inside wall and ceiling being overlaid with it.

Some really fine examples of craftsmanship in this line are found in the public buildings of New York city and elsewhere in America, notably the new buildings of the Hall of Records and the Appellate Division of the Supreme Court, in New York. In the making of monuments for the dead, marble is most extensively used. The floors of bathrooms, tops of toilet tables, basins for washing hands and clothes, tiling of various sorts—all these and a thousand other household purposes find in marble their chief exponent. Probably more than \$25,000,000 worth of finished marble products are used in the United States annually, made from domestic quarries entirely.

PUTNAM DREW.

Marble Faun, The, a romance by Nathaniel Hawthorne published in 1860. This is the last complete work by the author, and was thought by him to be his best. It was composed carefully and maturely, Hawthorne not having written anything for seven years; and appeared simultaneously in Boston and London under different titles. The original name proposed was 'The Transformation of the Faun,' shortened by the English publisher into 'Transformation,' and changed in America by Hawthorne to 'The Marble Faun.' The scene is laid in Rome; the chief characters, four in number, are introduced in the first chapter: Kenyon, an American sculptor; Hilda and Miriam, art students; and Count Donatello, an Italian.

Marbled Godwit. See GODWIT.

Marbled Tiger-cat. See TIGER-CAT.

Marblehead, mār'bl-hēd, Mass., town, in Essex County; on Massachusetts Bay, and on the Boston & Maine railroad. The town is on a peninsula which has Massachusetts Bay on the east and south and Salem harbor on the north, and includes the villages of Marblehead, Neck, Clifton, and Devereaux. It was settled by immigrants from Guernsey and Jersey in 1629, and was a part of Salem until 1649. Its good harbor gave it advantages for fishing and for coast trade that made it for a time the second settlement in importance in the colony, Boston being the first. Fishing continues one of the industries; others are boat-building and the manufacturing of shoes. It is a favorite yachting resort. There are still, in a good state of preservation, a number of pre-revolutionary buildings. The town has three well-kept parks, and Abbott Hall, which contains the town library, art gallery, and records, and in which are the offices for the town officials.

Judge Story and Elbridge Gerry were born and lived for some years in Marblehead. Consult: Agge, 'Sketches of Marblehead'; Roads, 'The History and Traditions of Marblehead.'

Marbles and Marble Playing. Marbles are small balls of baked clay, marble, agate or other minerals, used as toys and playthings for children. They are manufactured in large quantities in Saxony for exportation to the United States, and to India and China. They are also largely manufactured in the agate mills at Oberstein on the Nahe, in Germany, particularly for the American market. The material used in Saxony is a hard calcareous stone, which is first broken up into square blocks with a hammer. These are then thrown 100 to 150 together into a mill, which is constructed of a stationary

flat slab of stone, with a number of concentric furrows upon its face. Over this a block of oak of the same diameter, partially resting upon the small stones, is kept revolving, while water flows upon the stone slab. In 15 minutes the marbles are worn completely round, and are fit for sale. An establishment with three mills will manufacture 60,000 marbles in a week. Agates are made into marbles at Oberstein by first chipping the pieces nearly round with a hammer, and then wearing them down upon the face of large grindstones. The game of marbles is variously played; usually with a circular ring marked on the ground, the player taking one marble between the thumb and forefinger and dexterously shooting at other marbles within the circle, striking them with sufficient force as to throw them outside of the limits of the ring.

Mar'bling, in bookbinding, a process of ornamenting the edges of books. After the edges of the book have been cut by the plough (see **BOOKBINDING**) the book is tied between two boards and taken to the trough, a vessel 2 inches deep, which is filled with clean gum water. Various colored pigments, ground in spirits of wine and mixed with a small quantity of ox gall, are thrown upon the surface of the gum water, and disposed in various forms with a quill and comb, according to the required pattern. This being obtained, the edges of the book are dipped into the trough, and the colors adhere. Cold water is then dashed over the edges, which sets the colors and brings them out clear.

Marburg, mär'boorg, Prussia, a town of Hesse-Nassau, on the slopes of an acclivity above the Lahn, 46 miles north of Frankfort, 60 miles by rail via Cassel. The principal buildings are the castle of the landgraves of Hesse, now partly used as a prison; the 13th century church of St. Elizabeth; the town-house and the celebrated university, the first founded in Germany after the Reformation, and having in 1900, 93 professors and 1,184 students. The town has manufacture of machinery, leather, pottery and toys. Pop. (1900) 17,527.

Mar'bury v. Madison, a well-known decision in law handed down in 1803 by the United States Supreme Court. It is important as affording the earliest instance of the declaration by the Court that a Congressional statute is null and void by reason of its repugnance to the Constitution of the United States. Marbury was appointed justice of the peace in the District of Columbia by President Adams, but the commission, though drawn up, signed, and sealed, had never been delivered. Madison, when he became secretary of state, refused to deliver it. An act of Congress empowered the United States Supreme Court to issue to executive officers a writ of mandamus to force them to attend to their duties, and on the basis of this act Marbury brought suit. Now the Constitution nowhere mentions the right to issue a writ of mandamus among the cases of original jurisdiction by the Supreme Court. Chief-Justice Marshall therefore decided against Marbury, and his argument, admittedly the only accurate one, established an important precedent which is found only in the courts of the United States.

Mar'casite, in mineralogy, a bisulphide of iron. The term includes several varieties of iron pyrites, which have been named after the form

they present: namely, cellular pyrites, cockscomb pyrites, hepatic pyrites, or leberkies, etc. It is used in the manufacture of sulphur, sulphuric acid, and sulphate of iron.

Marcel, Etienne, â-të-ën mär-sël, French political leader: d. Paris 31 July 1358. From December 1355 he was provost of the Paris merchants and actual ruler of the city. He put to death two officials of the crown, and finally persuaded the Dauphin Charles to act as regent while King John was held by the English. Not finding the Dauphin properly submissive, he obtained assistance from Charles the Bad of Navarre. He was killed during an uprising of the more wealthy and conservative citizens against his power. Consult Lazard, 'Un Bourgeois de Paris au XIV. Siècle' (1890).

Marcellinus, mär-së-lī'nūs, **Saint**: d. 25 Oct. 305. He was a pope who succeeded Caius in 296. The Donatists alleged that during the Diocletian persecution he sacrificed to idols. He was, however, vindicated by Augustine from this charge.

Marcellus, mär-sël'ūs, **Marcus Claudius**, Roman general: b. before 268 B.C.; d. near Venusia, 208 B.C. In 222 being consul with Scipio he twice defeated the Insubrians in northern Italy, and with his own hand killed their king, thus winning the *spolia opima*. After the disaster of Cannæ in the Second Punic War (216), Marcellus took command, gained several slight victories over the Carthaginians, and hence was named "the sword of Rome." Fabius Cunctator being called "the shield of Rome." His third consulship (214) was spent in Sicily, where he attacked Syracuse, and after a two years' siege prolonged by the skill of Archimedes captured the city. In his fifth consulate after two years of varying success against Hannibal in Italy he was killed in a skirmish near Venusia.

Marcellus I., Saint, pope: d. 310. He succeeded Marcellinus in 304. The Emperor Maxentius banished him from Rome for excommunicating an apostate, and according to some authorities forced him to serve as a slave in the imperial stables. He suffered martyrdom under Maxentius.

Marcellus II. (MARCELLO CERVINI, mär-chël'lo chër-vë'në), pope: d. 1 May 1555. He was cardinal legate at Trent of Julius III., whom he succeeded in the pontifical chair. Although originally opposed to polyphonic music, he at once withdrew his opposition to it after listening to Palestrina's famous 'Missa Pope Marcelli.' His pontificate lasted only 22 days.

Marcellus Stage, in geology, a term introduced by the New York State Geological Survey for the thin rock mostly shale, which is the lowest group of the Upper Devonian System, and which is most typically seen in New York State at the little village of Marcellus, whence the stage is named.

March, Francis Andrew, American philologist: b. Millbury, Mass., 25 Oct. 1825. He was graduated from Amherst in 1845, studied law in New York in 1849-50, was admitted to the bar in 1850, in 1856 became adjunct professor of belles-lettres and English literature in Lafayette College (Easton, Pa.), and in 1857 professor there of the English language and comparative philology. In 1873-4 and 1895-6 he was presi-

dent of the American Philological Association, in 1876-1903 of the Spelling Reform Association and in 1891-3 of the Modern Language Association. He was among the earliest advocates of a historical study of the English language, and of a philological study of the classic works of that language. His contributions to the transactions and proceedings of the American Philological Association and other learned societies have been very extensive. He also edited the Douglass series of Christian Greek and Latin classics (1874-6), was director of the American readers for the great 'Historical Dictionary of English' of the London Philological Society, and published: 'A Method of Philological Study of the English Language' (1865); 'Parser and Analyzer for Beginners' (1869); an 'Anglo-Saxon Grammar' (1870); an 'Anglo-Saxon Reader' (1870); and an 'Introduction to Anglo-Saxon' (1871).

March, *mārġ*, Austria-Hungary, the principal river of Moravia, rising on the Silesian boundary, and flowing 214 miles southward to the Danube, which it joins six miles above Presburg. It is navigable for small boats from Göding, 50 miles from its mouth. In its lower course it forms the boundary between Austria and Hungary. Its chief affluent is the Thaya.

March, in Europe, a frontier or boundary of a territory; especially applied to the boundaries or confines of political divisions; as, for example, the frontiers between England and Scotland, and England and Wales. Geneva is situated in the Marches of France, Savoy and Switzerland.

March (Latin, *Martius*), (1) the third month of the year, originally the first of the Roman year; so named in honor of the Roman deity Mars. Prior to 1752 the 25th of March was the first day of the legal year; hence, January, February, and the first 24 days of March have frequently two years appended, as January 1, 170½ or 1701-2. (See CALENDAR.) (2) A movement by regular steps in the manner of soldiers; also a journey performed by a body of soldiers either on foot or on horseback. Soldiers on a march are subject to certain rules very necessary to keep them in good order, and fit to meet the enemy. The march in the first sense of regular step differs on different occasions. In the parade-march from 75 to 95 steps, each of about 30 inches, differing in different armies, are made in a minute; in the quick-march from 108 to 115 steps; and in the double quick 150 running paces. This last cannot be sustained for any length of time, and is only used in a charge, or in storming a commanding position, and in a few internal movements of regiments. (3) A musical composition, chiefly for military bands, with wind instruments, intended to accompany the marching of troops. There are slow and quick marches, and marches peculiar to different countries. Marches are also introduced into oratorios, the best-known examples being the 'Dead March' from the oratorio of 'Saul' and Mendelssohn's 'Wedding March.' See MUSIC.

March Flies, small, hairy, scavenging flies of the family *Bibionidae*, seen numerously in early spring, often before the snow has disappeared. The species are over 300, and some appear in vast swarms. The maggots hatch in refuse or manure upon the ground, and are believed to feed upon grass-roots.

March to the Sea. There were two plans for a march to the sea by Sherman's army, the first Gen. Grant's, the second Gen. Sherman's, modifying the first. A campaign to the sea to divide the Confederacy was decided upon by Gen. Grant in January 1864, when he was in command of the Military Division of the Mississippi, with headquarters at Nashville. His objectives on the coast were first Mobile, second, Savannah, Atlanta being the intermediate objective for both. Sherman's army was then in the vicinity of Chattanooga, Tenn., and Ringgold, Ga.

In a letter to Gen. Halleck, dated at Nashville, 15 Jan. 1864, Gen. Grant wrote: "I look upon the next line for me to secure, to be that from Chattanooga to Mobile, Montgomery and Atlanta being the important intermediate points." This he repeated on 19 January to Gen. Thomas, then in command of the Army of the Cumberland at Chattanooga, and this officer immediately began to gather information, which Gen. Grant desired, of the number of troops necessary to guard the roads and bridges from Nashville to Atlanta. These preparations were entrusted to Gen. Thomas, as Gen. Sherman was engaged with his Meridian campaign. In this connection, Gen. Thomas expressed his confidence in being able with the Fourteenth and Fourth corps in advance, covered with a strong division of cavalry, and the Eleventh corps in reserve, to overcome all opposition as far as Atlanta.

When Grant was made lieutenant-general and ordered east to command all the armies, he called Sherman to Nashville, and they traveled together as far as Cincinnati. Gen. Sherman was then made acquainted with the plans already set forth. As part of these plans, before leaving Nashville Gen. Grant ordered Banks to concentrate at least 25,000 men to move against Mobile in the spring in co-operation with Gen. Sherman.

In addition to letters to each of the commanders interested—Halleck, Sherman, Thomas and Banks—Gen. Grant, 26 March 1864, sent all army commanders a map upon which was indicated by red lines the territory occupied by the Union forces at the beginning of the War, and at the opening of the campaign of 1864. The territory which it was proposed to occupy by the campaigns about to begin was indicated by blue lines. This map reached Gen. Sherman 4 April, and its receipt was acknowledged by him. This map is reproduced in the Atlas of the 'Official Records' of the war, being plate 135 A of that publication. For Sherman's proposed campaign the blue lines extend from Chattanooga to Atlanta, and from this latter point both to Mobile and Savannah.

Gen. Sherman, in acknowledging the map, said: "That map to me contains more information and ideas than a volume of printed matter. Keep your retained copies with infinite care, and if you have occasion to send out to other commanders any more I would advise a special courier. From that map I see all, and glad am I that there are minds now at Washington able to devise; and for my part, if we can keep our counsels, I believe I have the men and ability to march square up to the position assigned me, and to hold it."

As the result of the campaign for Atlanta Gen. Slocum occupied that city 2 September. Meantime Farragut had taken possession of Mobile Bay 5 August. On 10 September Grant

MARCH TO THE SEA

telegraphed Sherman from City Point as follows: "As soon as your men are properly rested, and preparations can be made, it is desirable that another campaign should be commenced. We want to keep the enemy continually pressed to the end of the war. If we give him no peace while the war lasts, the end can not be far distant. Now that we have all of Mobile Bay that is valuable, I do not know, but it will be the best move for Major-General Canby's troops to act upon Savannah, while you move on Augusta. I should like to hear from you, however, on this matter."

To this Sherman telegraphed in reply: "If you can manage to take the Savannah River as high as Augusta, or the Chattahoochee as far up as Columbus, I can sweep the whole State of Georgia, otherwise I would risk our whole army by going too far from Atlanta."

In a letter from Atlanta, dated 20 September, Sherman gave Grant the conditions under which he could successfully co-operate in a movement on Savannah: "If you will secure Wilmington and the city of Savannah from your centre, and let General Canby have command over the Mississippi River and the country west of it, I will send a force to the Alabama and Appalachicola, provided you give me 100,000 of the drafted men to fill up my old regiments; and if you will fix a day to be in Savannah I will insure our possession of Macon and a point on the river below Augusta."

Gen. Grant thereupon conferred by letter with Gen. Halleck in regard to establishing a base on the coast for Gen. Sherman and providing supplies, giving his own opinion that Savannah could be captured by troops from the east assisted by those in the Department of the South, and that the line of Augusta and Savannah would be a better one than Montgomery, Selma, and Mobile. Grant further said in this letter 4 October: "Whichever way Sherman moves he will undoubtedly encounter Hood's army, and in crossing to the sea-coast will sever the connection between Lee's army and his section of the country."

Gen. Sherman fixes the day after his letter of 20 September as the date when his plan of a march to the sea came first into his mind. It differed from Grant's plan based upon first disposing of Hood's army, in that it involved leaving Hood in his rear, to be taken care of by Thomas, and marching through to Savannah with no enemy in his front. Upon this plan a discussion arose with Grant, who for some time held to the necessity of first dealing with Hood. This discussion between Grant and Sherman lasted for several weeks. While it was in progress Hood became active. On 20 September Forrest's cavalry began vigorous operations about Athens and Decatur, Ala., and Pulaski, Tenn. Sherman at once sent troops to Chattanooga, and 28 September Gen. Thomas was ordered to proceed to Nashville to organize a force to meet a possible northward move of Hood. The first attempt of the latter was to break Sherman's communications by heavy movements upon his railroad. These met with only temporary success, as Sherman promptly pursued. The fighting at Allatoona 5 October was the most prominent affair. Hood then moved to the westward, and occupied Gadsden, Ala. Sherman again followed as far as Gaylesville. Sherman, 10 October, again pro-

posed to Grant to leave Hood and march to the sea. Grant replied the same day. "If you are satisfied the trip to the sea-coast can be made, holding the line of the Tennessee firmly, you may make it, destroying all the railroads south of Dalton or Chattanooga as you think best." This condition of firmly holding the line of the Tennessee held Sherman for a time. Although this conditional permission had been given by Grant, he telegraphed Sherman 1 Nov.: "Do you not think it advisable, now that Hood has gone so far north, to entirely settle with him before starting on your proposed campaign? With Hood's army destroyed you can go where you please with impunity." Sherman learned, 26 October, that Hood's army had appeared about Decatur. This clearly indicated an invasion of Tennessee. Gen. Sherman then decided to strengthen Gen. Thomas, leave him to take care of Hood, withdraw his own army to Atlanta, and prepare for a march to the sea provided Gen. Grant's consent could finally be obtained. He sent the Fourth and the Twenty-third corps back to Thomas. Thus the discussion with Grant over the question of first destroying Hood continued until 1 November, when, in response to a later telegram on that day from Sherman, which represented that Hood's whole force was only from 37,000 to 40,000, while Thomas would have from 63,000 to 70,000, and that he himself had retained only 50,000 men for his proposed campaign to the coast, Gen. Grant telegraphed, "With the force, however, that you have left with Gen. Thomas, he must be able to take care of Hood and destroy him. I really do not see that you can withdraw from where you are, without giving up all that we have gained in territory. I say then go on as you propose."

Having obtained this permission Sherman pushed his preparations with the greatest energy. The entire population of Atlanta had already been deported; the various divisions of the army designed for the march were ordered to concentrate at Atlanta; all mills and factories at Rome were burned; the surplus stores, the sick, convalescent, and many thousands whose terms of service were about to expire were rushed to Chattanooga; the garrisons south of that place were withdrawn, and the railroad destroyed. Every command was carefully inspected, and soldiers found in any degree physically unsound were despatched to Nashville. Care was taken that every man's accoutrements were complete. In the same way the horses, mules, and trains were inspected. Wilson's cavalry was dismounted to make Kilpatrick's division perfect, and the remnants sent with Wilson to Nashville.

The march to the sea began on the morning of 15 November. As Gen. Sherman wrote: "It surely was a strange event—two armies marching in opposite directions, each in the full belief that it was achieving a final and conclusive result in a great war;—" Hood's army, which had required the active work of three armies from May until September to push it back to Atlanta, had crossed the Tennessee at Decatur, strengthened by Forrest's cavalry and aiming for Nashville and the Ohio River. The situation at Nashville was thus described by Sherman: "General Thomas was at Nashville, with Wilson's dismounted cavalry and a mass of new troops and quartermaster's employees amply

MARCH TO THE SEA

sufficient to defend the place. The Fourth and Twenty-third corps, under Generals Stanley and Schofield, were posted at Pulaski, Tennessee, and the cavalry of Hatch, Croxton, and Capron, were about Florence, watching Hood. Smith's (A. J.) two divisions of the Sixteenth corps were still in Missouri, but were reported as ready to embark at Lexington for the Cumberland River and Nashville. Of course, General Thomas saw that on him would likely fall the real blow, and was naturally anxious."

Sherman started with 62,204 officers and men. Of his army he wrote: "The most extraordinary efforts had been made to purge this army of non-combatants and of sick men, for we knew well that there was to be no place of safety save with the army itself; our wagons were loaded with ammunition, provisions, and forage, and we could ill afford to haul even sick men in the ambulances, so that all on this exhibit may be assumed to have been able-bodied, experienced soldiers, well armed, well equipped and provided, as far as human foresight could, with all the essentials of life, strength, and vigorous action."

The artillery, wagon, and ambulance trains were perfect. Each gun, caisson, and forge was drawn by eight horses. There were 2,500 wagons with six mules to each, and the ambulances each had two horses. Each soldier carried 40 rounds, and in the ammunition wagons were 200 rounds for men and artillery.

The right wing, Gen. O. O. Howard, was composed of the Fifteenth and Seventeenth corps; the left wing, Gen. H. W. Slocum, of the Fourteenth and the Twentieth.

The war had not produced a more thoroughly organized and equipped army, or one in which more men had passed a thorough physical inspection. As it started for the sea, Gen. Sherman in his 'Memoirs' thus describes the feelings of the men, and his own: "There was a devil-may-care feeling pervading officers and men, that made me feel the full load of responsibility, for success would be accepted as a matter of course, whereas, should we fail, this 'march' would be adjudged the wild adventure of a crazy fool." This question was to be decided at Nashville, as Gen. Sherman wrote the day after he entered Savannah: "Thomas' complete success is necessary to vindicate my plans for this campaign—" The march to the sea cannot, therefore, be fully understood without considering the Nashville campaign as one of its essential parts. See NASHVILLE, CAMPAIGN AND BATTLE OF.

Sherman's army was composed of 55,320 infantry, 5,063 cavalry, and 1,812 artillery. There were two corps, 13 infantry divisions, one cavalry division, 36 brigades of infantry, two of cavalry, and 16 batteries. There was no Confederate army between Atlanta and Savannah. Wheeler's cavalry was active on the flanks guarded by Kilpatrick's cavalry, and a considerable force of militia was encountered at Griswoldville.

The order for this historic march clearly presents its organization, its order of daily movement, its methods of living upon the country, the restrictions placed on its dealings with citizens, in short, the whole military machinery of the campaign. It therefore deserves a place in every history of the March to the Sea, Gen. Sherman himself holding that no account of

that event could be perfect without it. It was as follows:

(Special Field Orders, No. 120.)

Headquarters Military Division of the Mississippi, In the Field, Kingston, Georgia, November 9, 1864.

1. For the purpose of military operations, this army is divided into two wings, viz.:

The right wing, Major-General O. O. Howard commanding, composed of the Fifteenth and Seventeenth corps; the left wing, Major-General H. W. Slocum commanding, composed of the Fourteenth and Twentieth corps.

2. The habitual order of march will be, wherever practicable, by four roads, as nearly parallel as possible, and converging at points hereafter to be indicated in orders. The cavalry, Brigadier-General Kilpatrick commanding, will receive special orders from the commander-in-chief.

3. There will be no general train of supplies, but each corps will have its ammunition-train and provision-train, distributed habitually as follows: Behind each regiment should follow one wagon and one ambulance; behind each brigade should follow a due proportion of ammunition-wagons, provision-wagons, and ambulances. In case of danger, each corps commander should change this order of march, by having his advance and rear brigades unencumbered by wheels. The separate columns will start habitually at 7 A.M., and make about fifteen miles per day, unless otherwise fixed in orders.

4. The army will forage liberally on the country during the march. To this end, each brigade commander will organize a good and sufficient foraging party, under the command of one or more discreet officers, who will gather, near the route traveled, corn or forage of any kind, meat of any kind, vegetables, corn-meal, or whatever is needed by the command, aiming at all times to keep in the wagons at least ten days' provisions for his command, and three days' forage. Soldiers must not enter the dwellings of the inhabitants, or commit any trespass; but, during a halt or camp, they may be permitted to gather turnips, potatoes, and other vegetables, and to drive in stock in sight of their camp. To regular foraging-parties must be entrusted the gathering of provisions and forage, at any distance from the road traveled.

5. To corps commanders alone is entrusted the power to destroy mills, houses, cotton-gins, etc.; and for them this general principle is laid down: In districts and neighborhoods where the army is unmolested, no destruction of such property should be permitted; but should guerrillas or bushwhackers molest our march, or should the inhabitants burn bridges, obstruct roads, or otherwise manifest local hostility, then army commanders should order and enforce a devastation more or less relentless, according to the measure of such hostility.

6. As for horses, mules, wagons, etc., belonging to the inhabitants, the cavalry and artillery may appropriate freely and without limit; discriminating, however, between the rich, who are usually hostile, and the poor and industrious, usually neutral or friendly. Foraging parties may also take mules or horses, to replace the jaded animals of their trains, or to serve as pack-mules for the regiments or brigades. In all foraging of whatever kind, the parties engaged will refrain from abusive or

MARCHAND

threatening language, and may, where the officer in command thinks proper, give written certificates of the facts, but no receipts; and they will endeavor to leave with each family a reasonable portion for their maintenance.

7. Negroes who are able-bodied and can be of service to the several columns may be taken along; but each army commander will bear in mind that the question of supplies is a very important one, and that his first duty is to see to those who bear arms.

8. The organization, at once, of a good pioneer battalion for each army corps, composed if possible of negroes, should be attended to. This battalion should follow the advance-guard, repair roads and double them if possible, so that the columns will not be delayed after reaching bad places. Also, army commanders should practise the habit of giving the artillery and wagons the road, marching their troops on one side, and instruct their troops to assist wagons at steep hills or bad crossings of streams.

9. Captain O. M. Poe, chief-engineer, will assign to each wing of the army a pontoon-train, fully equipped and organized; and the commanders thereof will see to their being properly protected at all times.

By order of Major-General W. T. Sherman,

L. M. Dayton, Aide-de-Camp.

Leaving Atlanta in ruins, 15 November, the left wing, which Gen. Sherman accompanied, marched by Decatur, Stone Mountain, and Covington. At this point it turned toward Milledgeville, the capital of Georgia, which was the first objective. It was reached on the 22d. Meantime the right wing had marched by Jonesboro, McDonough, and Monticello, and was in communication with Sherman at Gordon. Kilpatrick's cavalry, which was operating on the right of the advance, kept in contact with Wheeler's cavalry, and reached the defenses of Macon, thence retiring to Griswoldville, where Walcutt's brigade of Wood's division was halted as a rear-guard. Gen. G. W. Smith attacked Walcutt, but was repulsed (see GRISWOLDVILLE, BATTLE OF). Gov. Brown, the State officers, and members of the legislature left the capital on Sherman's approach. The arsenal and various public buildings were destroyed.

The march was resumed 24 November, with Millen as the next objective. The two wings followed the general line of the railroad. Millen was reached 3 December. From Millen the army proceeded by the four main roads for Savannah. The effort of the Confederate authorities to organize a force at Augusta to attack Sherman in flank failed, and the march to Savannah was only slightly disturbed by the persistent skirmishing of Wheeler's cavalry. McLaw's division of Hardee's force had advanced to Ogeechee Church, but fell back to the city upon Sherman's approach. The several corps reached the defenses of Savannah 9 and 10 December, and occupied a line from the Ogeechee River on the right to the Savannah River on the left. Hardee occupied the city with something less than 10,000 men. Sherman's effective force numbered a little over 60,000. Hood held the Savannah River below Sherman's lines.

The march had cut a swath of many miles in width through the richest part of Georgia. The heads of the columns and the flanks swarmed with foraging parties, and a country

which was daily scoured to supply food for a marching column of 60,000 soldiers was of necessity stripped of provisions, and of everything else that could contribute to the use or comfort of an army. Railroads had been destroyed for long distances, and all factories and other buildings burned which could contribute to army purposes. There had been no fighting worth mentioning, Griswoldville excepted, and that had only involved one Union brigade.

Gen. Sherman had left Atlanta with 62,204 officers and men of all arms. He reached Savannah with 60,057. On the march 103 were killed, 428 wounded, 278 missing, and 1,338 captured. Of those captured, a large proportion were foragers, better known in army vernacular as "bummers."

The night of 12 December a bridge had been completed over the Ogeechee, and the next morning Hazen's division crossed and marched at once to assault Fort McAllister (q.v.) and open the way to the sea. An hour before sunset the assault was delivered and the fort taken.

This success gave Sherman communication with the fleet which was awaiting him with supplies, and mails for the army.

Gen. Slocum, upon establishing his flank on the Savannah River, had captured two steamboats and sent a force to Hutchinson and Argyle Islands just above the city, and sought permission to transfer a corps to the left bank of the river to close Hardee's only line of escape, Gen. Slocum having already sent a brigade under Col. E. A. Carman to the South Carolina shore. Gen. Sherman did not deem this prudent, and as a result Hardee later withdrew his entire force intact and without molestation.

On 17 December Gen. Sherman sent in a flag of truce demanding Hardee's surrender on the ground that he (Sherman) had received guns that could "cast heavy and destructive shot as far as the heart of the city"; that he controlled all avenues by which the city could be supplied with food; that he would grant liberal terms, but if forced to assault he should "feel justified in resorting to the harshest measures," and should make little effort to restrain his army.

Gen. Hardee returned a defiant reply, saying he was not shut in, but had free and constant communication with his department. To the specific call for surrender he replied: "Your demand for the surrender of Savannah and its dependent forts is refused."

Gen. Sherman then proceeded by boat to Gen. Foster's headquarters at Hilton Head to request that a division be sent to occupy the road north of the Savannah River, which line of communication was still open to Hardee. On his return he received the news that during his absence Hardee had put down his bridges and withdrawn with his entire force. The next day Gen. Sherman's forces occupied Savannah.

Marchand, mār-shān, Félix Gabriel, Canadian legislator and author: b. St. John's, P. Q., 9 Jan. 1832. He was educated at St. Hyacinth College, was admitted a notary public in 1855, entered practice at St. John's, and from 1867

sat for the county of St. John's in the legislative assembly of the province of Quebec. From 8 March 1878 to 19 March 1879 he was provincial secretary, from 19 March to 30 Oct 1879 was commissioner of crown-lands, and from 29 Jan. 1887 to 1892 speaker of the assembly. In 1897 he became premier, with the treasury portfolio. Subsequent to the invasion at Eccles Hill during the Fenian troubles (1870), he commanded a militia brigade. He did much to improve Canadian journalism, and for many years was proprietor and editor of *Le Franco-Canadien*. He published a 'Manuel et Formulaire du Notariat'; and also the comedies 'Fatenville' and 'Erreur n'est pas Compte' in prose, and 'Un Bonheur en Attire un Autre' and 'Les Faux Brillants' in verse.

Marchand, Jean Baptiste Thomas, zhōn bā-tēst tō-mā, French officer and explorer: b. Thoisse 22 Nov. 1863. He attended the military school at St. Maixent, entered the marine service in 1883, was sent to Senegambia in 1889, and in 1890 explored the sources of the Niger. In 1898 he occupied Fashoda, having established a line of posts between French possessions in West Africa and on the eastern coast, but on the demand of England he was forced to withdraw. He took part in the expedition against China in 1900. Consult: Castellani, 'M. l'Africain' (1902); Poirier, 'De l'Oubanghi à Fashoda' (1900).

Marches, The, Italy, a territory now included in the kingdom, but formerly constituting one of the legations of the Papal States. It comprises the region lying between the Apennines and the Adriatic, and is divided into the modern four provinces—Urbino and Pesaro, Ancona, Macerata, and Ascoli Piceno. See ITALY.

Marchesi, mār-kā'sē, Mathilde, German singer: b. Frankfort-on-Main, 26 March 1826. Her maiden name was Graumann; she studied under Nicolai in Vienna, and in Paris under Garcia, whose assistant she became. A splendid mezzo soprano she toured Europe for several years, married Salvatore Marchesi, a baritone, in 1852, and in 1854 became professor at the Vienna Conservatory. After three years at Cologne in a like position she removed to Paris in 1868. She was a teacher of rare merit, and author of a method of singing, of two volumes of personal recollections in German (1877; 1888), and of 'Marchesi and Music' (1897).

Marchiali, mār-kē-ā'le, or Marchialy. See IRON MASK, MAN WITH THE.

Marching Through Georgia, a popular ballad sung during the American Civil War, and commemorating Sherman's March to the Sea. It was written by H. C. Work (q.v.) 16 Nov. 1864.

Marcion, mār'shī-ōn, founder of a Gnostic sect, called Marcionites: b. Sinope about the beginning of the 2d century, A.D.; d. about 160. He was a son of the bishop of Sinope, who had become a bishop in his later years, but so much error was mixed with his religious opinions that he was excommunicated by his father. Expecting that his views would meet with a better reception at Rome he set out for that city, but was there a second time excommunicated, 140. He attached himself while there to the Gnostic teacher Cerdo of Antioch, and

founded a system antagonistic in many respects to Christianity. Its principal feature was the irreconcilable opposition which it supposed to exist between the Creator and the Christian God, and between the religious systems, the law and the gospel, which it believed they respectively founded. The sect held the existence of three original principles—the supreme and invisible, whom Marcion called the Good; the visible God, the Creator; and the devil, or perhaps matter, the source of evil. Marcion could not perceive in nature, or in the Old Testament, the same love which was in the gospel of Christ. He accordingly made the Creator, the God of the Old Testament, the author of suffering. Jesus was not the Messiah promised by this being, but the son of the unseen God, who took the form, but not the substance of man. Marcion denied the resurrection of the body; he condemned marriage, thinking it wrong to increase a race born in subjection to the harsh rule of the Creator. He rejected the whole of the Old Testament, and of the New all except a few epistles and a mutilation of the Gospel of Luke. Consult: Tertullian, 'Contra Marcionem'; Harnack, 'History of Dogma.'

Marco Bozzaris. See BOZZARIS, MARCOS.

Marco Polo. See POLO, MARCO.

Marcomanni, mār-kō-mān'nī ("men of the marches," "borderers"), ancient German tribe, belonging to the confederation of the Suevi. About 10 B.C., under their King Marbod or Maroboduus, they retired from their territory between the Elbe and the Oder before the advance of the Romans, settled in Bohemia, and there built up a powerful state, with which Tiberius made a treaty 6 A.D. Thirteen years later Maroboduus was defeated by Hermann, or Arminius, leader of the Cherusci, who also drove from power Catualda, Marbod's successor. About the middle of the 2d century the Marcomanni, with other Teutonic tribes, attempted to make inroads into Pannonia; they were defeated by Marcus Aurelius in 178; Commodus made peace with them in 180; they furnished Roman troops and were heavily subsidized till the time of Aurelian, when in 270 they were again rebellious and again driven across the Danube. In the 4th century the Marcomanni drop out of history.

Marconi, Guglielmo, gool-ē-ē'l'mō mār-kō'nē, Italian inventor and electrical engineer: b. Marzabotto, near Bologna, Italy, 23 Sept. 1875. He was educated at the universities of Bologna and Padua, and so early as 1890 undertook experiments in demonstration of his theory that the electric current readily passes through any substance, and when started in a given direction follows a direct course without the assistance of any sort of conductor. He finally invented an apparatus for wireless telegraphy, which was successfully tested in England and Italy by Sir William Henry Preece, engineer and electrician-in-chief of the English postal-telegraph service. Marconi was the first to perfect the appliances used in space telegraphy, and the first to patent the application of the electric waves discovered by Heinrich Hertz to the purposes of actual telegraphy as distinguished from mere signaling. This remains true in spite of all the discussion respecting the originality of Marconi's work. It was he who combined the important elements of the wire-

Copyright, 1903, by Scientific American.

GUGLIELMO MARCONI.

less telegraph that had previously been invented, and to him the scientific triumph of space telegraphy is due. He came to the United States in 1899, there continued his experiments, and in 1900 employed his method in reporting the presidential election of that year. He had already (27 March 1899) sent messages across the English Channel from the vicinity of Boulogne, France, to the South Foreland, England, 32 miles distant. In December 1901 he began his first experiments in transatlantic telegraphy without wires at Signal Hill, at the entrance to the harbor of St. John's, N. F. When his success became apparent through his receiving and plainly distinguishing signals from the Poldhu Station, England, the Anglo-American Cable Company, which holds a monopoly from Newfoundland, compelled him to withdraw, and he selected another station at Table Head, on the east of Glace Bay, Cape Breton Island. On 25-6 Feb. 1902, Marconi, on his way to the United States on board the steamship Philadelphia, received signals at a distance of 2,099 miles and worded messages at a distance of 1,551.5 miles. On 21 Dec. 1902 the first official transatlantic telegrams were sent from Table Head. Marconi later (18 Jan. 1903) sent from the South Wellfleet station, Cape Cod, Mass., direct to Poldhu (3,000 miles), a message from President Roosevelt to King Edward. The Italian government introduced the Marconi system on its warships, and granted an annual subsidy of \$200,000. The English government pays royalty for the use of the system on its ships. Thus far (1903), the United States is not committed to the Marconi system, but is impartially testing that and other methods. See WIRELESS TELEGRAPHY.

Marcou, mär-koo', Jules, American geologist: b. Salins, France, 20 April 1824; d. Cambridge, Mass., 17 April 1898. He studied at Besançon and the Collège de St. Louis in Paris; devoted himself to geology after several journeys through Switzerland, in which he made the acquaintance of Jules Thurmann, to whom he owed an introduction to Louis Agassiz. In 1846, after taking part in the geological survey of the Jura Mountains he was appointed assistant mineralogist in the Sorbonne; in 1848 having been appointed traveling geologist to the Jardin des Plantes came to America, explored the Lake Superior country together with Agassiz and made wide and important geological studies in Virginia, Pennsylvania and New Jersey, and after several trips back to Europe settled in Cambridge, where he assisted Agassiz in the Museum of Comparative Zoology. From 1853 to 1855 he was in government employ, and from 1875 till shortly before his death was again in the service. Marcou made a section map of the 35th parallel from the Mississippi to the Pacific, and published: 'Geological Map of the United States and British Provinces of North America' (1853); 'A Catalogue of Geological Maps of America' (1884); 'Geology of North America' (1858); 'Life, Letters, and Works of Louis Agassiz' (1896).

Marcus Aurelius, mär'kūs à-rē'li-ūs. See AURELIUS ANTONINUS, MARCUS.

Marcus Græcus, grē'kūs, pyrotechnist and alchemist, with regard to whose life nothing is known. He must have lived not later than the 11th century, since he is cited by an Arabian

physician of that date. In the National Library at Paris are two manuscript copies of a small treatise, entitled 'Liber Ignium ad Comburendos Hostes, Auctore Marco Græco,' one of which appears to belong to the 14th and the other to the 15th century. The work contains an account of an explosive substance the ingredients of which are the same as those used in making gunpowder, though differently proportioned. It may have been that Schwartz, the reputed inventor of gunpowder, did nothing more than experiment on the receipts of Marcus Græcus. The treatise also contains the first account that has come down to us of the method of making Greek fire.

Mar'cy, Randolph Barnes, American general: b. Greenwich, Mass., 9 April 1812; d. Orange 22 Nov. 1887. He was educated at West Point in 1832; and served in the Black Hawk War. During the Mexican War he was active at Palo Alto and Resaca de la Palma; and was made inspector-general, U. S. A., with the rank of colonel, in August 1861, serving as chief of staff to his son-in-law, General George B. McClellan throughout the Civil War. He was appointed brigadier-general of volunteers, 23 Sept. 1861, was inspector-general, U. S. A., with rank of brigadier-general from December 1878. He was retired in the year last named. He published: 'Exploration of the Red River in 1852' (1853); 'The Prairie Traveler, a Handbook for Overland Emigrants' (1859); 'Thirty Years of Army Life on the Border' (1866); 'Border Reminiscences' (1871).

Marcy, William Learned, American statesman: b. Southbridge, Mass., 12 Dec. 1786; d. Ballston Spa, N. Y., 4 July 1857. He studied at Leicester Academy, in Massachusetts, and was graduated at Brown University in 1808. At Troy, N. Y., he studied law and was admitted to the bar. When the War of 1812 broke out he volunteered as a lieutenant, was sent at once into active service, and 22 Oct. 1812 led an attack resulting in the capture of a Canadian post at Saint Regis. He was soon promoted to be captain, and served almost to the end of the war. Returning to Troy, he engaged in newspaper work and in politics, opposed Clinton and became prominent in the Albany Regency (q.v.). He had already held several offices when, in 1823, he was elected comptroller of the State. This position he filled six years, and in 1829 was appointed associate justice of the New York supreme court. The Democrats in 1831 elected him to the United States Senate, but the next year he was chosen governor of New York and resigned his senatorship. While in the Senate he was chairman of the Judiciary Committee, and in debate with Clay made a memorable defense of Martin Van Buren. It was during a speech in the Senate vindicating the course of the President in giving offices to his political supporters that Marcy uttered the words associated with the beginning of the spoils system (q.v.): "We can see nothing wrong in the maxim that to the victors belong the spoils." Having served three terms as governor, he was once more nominated, in 1838, but was defeated by W. H. Seward (q.v.). In the following year Marcy was appointed by President Van Buren a commissioner on Mexican claims, serving till 1842. In 1845 he became secretary of war under Polk, and in that office bore arduous,

responsibilities created by the Mexican War. He also used his official influence in the settlement of the momentous Oregon boundary question. In 1848 he supported Cass as presidential candidate, and when Taylor was inaugurated Marcy retired to private life. But during the administration of Pierce he served from 1853 to 1857 as secretary of state, greatly distinguishing himself at home and abroad by his handling of grave matters,—the Mexican boundary dispute, the reciprocity treaty with Canada, the British fishery question, the Koszta affair (see INGRAHAM, DUNCAN NATHANIEL), etc. On the inauguration of President Buchanan in 1857 Marcy finally retired from office, dying four months afterward. Among statesmen of administrative ability and thorough training, both for domestic and foreign affairs, he holds a high and permanent place.

Marcy, Mount, N. Y., the highest peak of the Adirondack Mountains, in the northeastern part of the State, in Essex County; about 28 miles west of Lake Champlain. The altitude is 5,344 feet. Lake Tear of the Clouds, 4,327 feet above sea-level, usually considered the main source of the Hudson River, is just southwest of Mount Marcy. The Indian name for this peak was 'Tahawas,' meaning the "cloud-divider."

Mar'den, Orison Swett, American editor and author; b. Thornton, N. H. He was graduated at the Boston University in 1877; at the School of Oratory there in 1879; at the Law School of the same institution in 1881; and in 1882 at the Harvard Medical School. He is founder and editor of 'Success,' and vice-president of the Success Company, and is the author of many works, among which are: 'Pushing to the Front' (1894); 'How to Succeed' (1896); 'The Secret of Achievement' (1898); 'Character the Grandest Thing in the World' (1899); 'The Hour of Opportunity' (1900); 'Talks with Great Workers' (1901); and 'Stepping Stones' (1902).

Mardi Gras, mār-dē grā, Shrove Tuesday, the last day before Lent. (See CARNIVAL.) In the United States the day is observed in New Orleans and Memphis with processions, masquerade balls, and other gay entertainments.

Mardonius, mār-dō'nī-ūs, Persian general, was the son of the Satrap Gobryas, and son-in-law of Darius Hystaspes. He commanded the first Persian armament sent against Greece, 492 B.C., when a storm at Mount Athos destroyed his fleet, and his army was beaten in Macedonia. He accompanied Xerxes in his invasion of Greece, of which he had been the chief promoter; and after the battle of Salamis, and the return of Xerxes to Asia, Mardonius was left in occupation at Athens, which he held for 10 months. According to Herodotus he was defeated by Pausanias, and probably killed at the battle of Plataea, 479 B.C.

Mare Clausum, mā-rē klā'sūm, a Latin phrase meaning closed sea, or that portion of the sea under the jurisdiction of a particular nation or government, as distinguished from the high sea. See INTERNATIONAL LAW.

Mare Island, Cal., in San Pablo Bay, and a part of Solano County; 28 miles north of San Francisco, and opposite the city of Vallejo. A United States naval station, one of the largest in the country, is on this island. It has wet

and dry docks, ordnance yards, marine barracks, a hospital, an observatory, repair shops, and at the southern extremity of the island, a lighthouse.

Maree, Loch, lõn mā-rē', Scotland, a lake in the west of Ross-shire, forming a long and comparatively narrow expanse, stretching south-east to northwest for 12½ miles with an average breadth not exceeding 1½ miles. Its depth in most places is 60 fathoms; it has never been known to freeze. The scenery along its shores is bold and picturesque, and its surface is studded with 24 wooded islands, on one of which are found the remains of an ancient chapel, with a graveyard. The loch discharges itself into Loch Ewe by a small river of the same name.

Mareia, mā-rā'ā, Lake. See MAREOTIS, LAKE.

Maremma, mā-rēm'mā, Italy, low swampy tracts extending along the west coast of Tuscany from the mouth of the Cecina to Orbetello; length, 92 miles; breadth, from 6 to 20 miles; area, about 1,000 square miles. Formerly these regions were fruitful, healthful, and populous; but after the 15th century the neglect of the water-courses of the district allowed the formation of marshes, and now they generate tertiary fevers, and present an aspect of dreary desolation during the summer months, when the inhabitants flee from the pestilential exhalations of the soil. In winter, on the other hand, the Maremma are inhabitable, and afford a luxuriant pasturage for cattle, which graze in summer on the Apennines. The district is gradually being reclaimed and improved.

Marengo, mā-rēng'gō, Italy, a northern village, near the Bormida, three miles southeast of Alessandria. Its name is connected with the defeat of the Austrians by Napoleon 14 June 1800. The Austrians under Melas were at first successful, but French reinforcements arriving, the cavalry charge of the younger Kellermann turned what looked like certain defeat into a decisive victory. The forces engaged were 33,000 French, and 30,500 Austrians; the French lost in killed and wounded 7,000, the Austrians 6,400, while 3,000 were made prisoners.

Maren'jo, Iowa, city, county-seat of Iowa County; on the Iowa River, and on the Chicago, Rock Island & Pacific railroad; about 85 miles east by north of Des Moines. It is in a fertile agricultural and stock-raising locality. The chief manufactures are dairy products, agricultural implements, and flour. It is the trade centre for a large part of Iowa County. Pop. (1900) 2,007.

Mareotis, mā-rē-dō'tis, or **Mariut, mā-rē-oot'**, Egypt, a lake separated from the Mediterranean on the west by the long narrow belt on which Alexandria stands, and communicating on the north with Lake Madieh. In the southwest it terminates in a long narrow creek; the main expanse is about 28 miles long by 20 broad. It was at one time deep enough for inland navigation, and had its shores covered with beautiful gardens and vineyards; but having been cut off from the Nile, which supplied its water, it became dry and its area was cultivated. During the siege of Alexandria in 1801 the British let the sea into it, and it now yields much salt by evaporation.

MARE'S TAIL — MARGARET OF NAVARRE

Mare's Tail, a genus (*Hippuris*), of plants with whorled narrow leaves and small inconspicuous flowers set in their axils. They are aquatic or marsh plants. *H. vulgaris* is very common in Europe and has become naturalized in the interior of the United States.

Maretszek, mǎ-rě tsěk, **Max**, American musician: b. Brunn, Austria, 28 Jan. 1821; d. Pleasant Plains, Staten Island, 14 May 1887. He was educated at the University of Vienna, but desirous of a wider field went to London and was connected for a time with its Italian Opera as chorus-master, writing in addition some music. In 1848 he came to New York, where he was appointed leader of the orchestra at the Italian Opera and subsequently at the Astor Place Theatre and the Grand Opera House. He wrote the operas of 'Hamlet,' 'Sleepy Hollow,' and 'Crochets and Quavers' (1858). Under his management many notable operas and artists, among the latter Adelina Patti and Pauline Lucca, were presented to American audiences.

Marforio, mār-fō-rī-ō, the popular name of a colossal statue representing the river Rhine, or Danube, or river God, standing in the court of a wing of the Capitol at Rome. The name Marforio is a corruption of *Martis forum* (the forum of Mars), in the entrance of which the statue originally stood.

Margaret, Saint, queen of Scotland, elder sister of Edgar Ætheling, and granddaughter of Edmund Ironside: b. Hungary about 1045; d. Edinburgh 16 Nov. 1093. Shortly after William the Conqueror had established himself on the English throne she and her brother Edgar went to Scotland and placed themselves under the protection of Malcolm Canmore, the Scottish king, who in 1070 became her husband. She was characterized by great devotion to the church, and it was largely through her influence with the king that the Scottish Church was brought into conformity with those of England and the Continent. She is said, moreover, to have elevated the manners of the Scottish court, and introduced great improvements in needlework, embroidery, and other similar arts. In her personal life, and the great care with which she educated her children, she set a noble example to the people of the somewhat rude and uncultured kingdom. In 1250 she was canonized. Her daughter Matilda married the English king, Henry I., and thus the old Anglo-Saxon line became united with that of the usurping Normans. There is an ancient life of Saint Margaret, written in Latin, it is commonly believed by her confessor Turgot, bishop of St. Andrews. The Bodleian library at Oxford contains a copy of the Gospels which once belonged to her.

Margaret, queen of Denmark, Norway, and Sweden, daughter of Waldemar III., king of Denmark: b. Copenhagen 1353; d. 28 Oct. 1412. She was married to Hakon, king of Norway, in 1363, and the death of her husband in 1380 placed Norway in her hands; that of her son Olaf in 1387 enabled her to secure the throne of Denmark, to which she had previously brought about his election; and after defeating Albert, the Swedish king, she also obtained possession of the throne of Sweden. She endeavored to place the union of the three kingdoms on a permanent basis by the celebrated Act of Union, or Treaty of Calmar (1397). She

died after having raised herself to a degree of power then unequaled in Europe from the time of Charlemagne. She is sometimes styled "The Semiramis of the North."

Margaret of Anjou, ăn'joo or ăn-zhoo, queen consort of Henry VI. of England: b. probably at Pont-à-Mousson, Lorraine, 23 March 1430; d. near Saumur in Anjou, 15 Aug. 1482. She was the daughter of René the Good, of Anjou, titular king of Naples, and was married to Henry in 1445. The imbecility of the king made her practically regent, and her power being contested by the Duke of York, a claimant of the throne by an older line, the protracted Wars of the Roses began. At first victorious, she was afterward compelled to flee to Scotland, but raising an army in the north, she secured, by the battles of Wakefield (1460) and Saint Albans (1461), the death of York, and the release of the king. Her army, however, was soon afterward annihilated at Towton (1461), and Edward (IV.), the son of the late Duke of York, was declared king. She succeeded in obtaining assistance from Louis XI. of France, but was once more defeated, and took refuge in that country. Warwick then became embroiled with the young king, and determined to replace Henry on the throne. Edward was in turn obliged to escape to the Continent, but obtaining assistance from the Duke of Burgundy, returned and defeated Warwick at Barnet (1471). Margaret, collecting her partisans, fought the battle of Tewkesbury (1471), and was totally defeated. She and her son were made prisoners, and the latter, when led into the presence of the royal victor, was killed. Henry soon after died or was murdered in the Tower, and Margaret remained in prison four years. Louis XI. ransomed her for 50,000 crowns. See HENRY VI.; ROSES, WARS OF THE.

Margaret of Austria, governor-general of the Netherlands, and daughter of Maximilian I. of Austria: b. Brussels 10 Jan. 1480; d. Mechlin 1 Dec. 1530. She was educated at the French court; was betrothed to the Dauphin Charles, who married Anne of Brittany; married John, the Spanish crown-prince, in 1497; and, after his death in the same year, married Philibert of Savoy in 1501, only to be widowed again in 1504. Three years afterward her father made her regent of the Netherlands, where she ruled with much ability although a bitter enemy of the Reformation. She took a prominent part in the peace of Cambrai in 1529, which is called, because negotiated by her and Louise of Savoy, the "Paix des Dames."

Margaret of Flanders, countess of Flanders and Hainault, sometimes called Margaret of Constantinople: b. Valenciennes about 1200; d. Lille 1279. She was a daughter of Baldwin IX. of Flanders and Hainault, who was succeeded by Margaret's older sister, Jeanne. Margaret's husband, Bouchard, was seized and killed by Jeanne, upon whose death Margaret came to the crown in 1244. Her reign was peaceable, save for the quarrels between her children by Bouchard and those by Guillaume of Dampierre.

Margaret of Navarre, na-văr, or of Valois, or of France, French princess, daughter of Henry II.: b. St. Germain-en-Laye, France, 14 May 1553; d. Paris 27 March 1615. She married in 1572 Henry of Navarre, afterward Henry IV. of France. It was entirely a marriage of policy,

MARGARET OF PARMA — MARGARETTA

and on Henry's accession to the throne, their marriage was dissolved by mutual consent. She resided thereafter in Paris where her house became the rendezvous for the learning and fashion of the time. Some very agreeable poems by her are extant, and her 'Memoirs' (1842) are extremely curious.

Margaret of Parma, regent of the Netherlands, a bastard of Charles V. of Spain by a Flemish woman: b. Oudenarde 1522; d. Ortona 1586. Brought up in Brussels, she was married to Alessandro de' Medici in 1536, and in 1538 to Ottavio Farnese, duke of Parma, to whom she bore the great general Alexander Farnese. In 1559 Philip II. made her staathouder of the Netherlands. There she sided with Granvella, introduced the Inquisition, and provoked the provinces to revolt by her strong, masculine policy. She resigned in 1567 when Alva was sent to the Netherlands.

Margaret Tudor, queen of Scotland, wife of James IV., and daughter of Henry VII. of England: b. Westminster 29 Nov. 1489; d. Methven Castle 18 Oct. 1541. She was married to the king of Scotland when 14; bore him three children, of whom two, James, later fifth king of Scotland of that name and father of Mary Stuart, and Margaret, mother of Lord Darnley, survived her; and after the king's death (1541) married Douglas, Earl of Angus, from whom she was divorced in 1527, to marry soon after Henry Stewart, Lord of Methven. By descent from Margaret Tudor her great-grandson, James VI. of Scotland, was Elizabeth's successor as James I. of England.

Margaret, or Marguerite de Valois, vâl-wâ, Queen of Navarre: b. Angoulême 11 April 1492; d. Paris 27 March 1549. (Various known as Margaret of Angoulême, of Alençon, and of Navarre.) She was the sister of Francis I. of France, was brought up at the court of Louis XII., married the Duke of Alençon in 1509, became a widow in 1525, and in 1527 married Henry d'Albret, titular king of Navarre. She never reigned over Navarre, but resided at the French court or kept a court of her own at Nérac and Pau. She was acquainted with the principles of the Protestant reformers, and not only afforded protection to reformed divines, but used her influence with her brother Francis to the same purpose, and was a great patroness of men of letters. In 1533 she published a religious poem, 'Le Miroir de l'Ame Pécheresse,' which incurred the censure of the Sorbonne as heretical. In 1547 a collection of her poems and other pieces was printed under the title of 'Marguerites de la Marguerite des Princesses.' The 'Heptaméron, ou sept Journées de la Reyne de Navarre,' a famous collection of tales long attributed to her, is at present regarded as of composite authorship. She left one child, Jeanne d'Albret; afterward mother of Henry IV. Her letters have been published in modern times. Consult: Comtesse d'Haussonville, 'Marguerite de Valois' (1870); Lotheissen, 'Königin Margaret von Navarre' (1885); Freer, 'Life of Marguerite d'Angoulême' (1895).

Margaret Sidney. See LOTHEROP, HARRIET MULFORD STONE.

Margaretta, The, a British armed schooner, captured by Americans near Machias, Maine, 12 June, 1775, in the first naval contest of the Revolution. In April 1774, Captain Icha-

bod Jones sailed into the harbor of Machias, and there, on account of complications caused by the Boston Port Bill (q.v.), he remained for a year, with his vessel hauled up. When news of the battle of Lexington reached Machias, Jones was loading two sloops, the Unity and the Polly, for Boston, whither he soon sailed. The whole country was now excited over the Port Bill, and in Boston it had caused much distress.

Jones wished to return to Machias with provisions, of which the people there were in want. Admiral Graves, the British officer in charge of Boston Harbor, granted him permission to sail on condition of his bringing back lumber for the use of the British troops, and the admiral ordered the Margaretta, a cutter of about 100 tons, carrying about 40 men, to accompany Jones to his destination to see that this condition was fulfilled; also that the American skipper should convey to Boston the stores of an armed vessel lately cast away. Jones is said to have been favorable to the British, whose protection at this time he may have solicited. His two sloops, convoyed by the Margaretta, arrived at Machias 2 June 1775; but many of the citizens, declaring that he should carry no lumber to Boston, organized for resistance to the enforcement of Graves' order.

The leader of this opposition was Benjamin Foster, a colonial soldier, who had been present at the capture of Louisburg from the French. A secret meeting was called, and on Saturday, 10 June, men of Machias and neighboring settlements gathered in the woods to consider the advisability of attempting to take the sloops, capture the Margaretta, and make prisoners of the cutter's officers and crew. Among those that assembled was Jeremiah O'Brien, who, with several brothers, participated in the subsequent capture. During the discussion Foster stepped across a small brook running near, and called on all in favor of the attempt to follow. The majority followed him, and then "a unanimous declaration of war" was made.

On Sunday, 11 June, Jones and the principal officers of the Margaretta being at church, Foster and others started to take them into custody; but, getting the alarm, they escaped by jumping from the windows — Jones fleeing to the woods, while the British officers returned to the Margaretta and weighed anchor, threatening to fire on any who should interfere with Jones' sloops.

In spite of this threat the Americans determined to carry out their purpose. When the enemy was sighted, on Monday, the 12th, Jeremiah O'Brien was chosen to lead the movement, and while he took 40 men on board the Unity, Foster, with another party, boarded the Falmouth Packet, a schooner lying at hand. The bold defiers of British force had only "a few charges of powder and ball for 20 fowling-pieces [muskets?], 13 pitchforks, and 10 or 12 axes," the powder and balls being nearly all on O'Brien's vessel. As they approached the Margaretta she was ready for action, and her commander, Moore, gave warning that he would fire if they came nearer. O'Brien called upon him to surrender, while Stevens, O'Brien's lieutenant, told Moore to "fire and be damned!" To avoid action, Moore crowded all sail and stood out to sea. But the Unity was the better sailer, and as she overhauled them the British opened

MARGARIC ACID — MARGAY

fire, which the heroes of the "fowling-pieces" returned with effect. The vessels coming together, a short musketry fight ensued. Moore himself threw hand-grenades, but was shot down. The Americans—O'Brien at their head—boarded the cutter and soon had complete possession of her.

In this plucky exploit one of the American party was killed and four wounded, one mortally. On the Margareta four were killed besides her commander, who died of his wound. Her captors triumphantly took the Margareta to Machias the same day, and her crew were held until July as prisoners of war. So ended "one of the most bold, energetic, and extraordinary occurrences of the times." With the armament of the Margareta—four 3-pounders and 14 swivels—the Unity was fitted out, and she was thenceforth called the Machias Liberty.

Margaric Acid, or **Heptadecic Acid**, a name now applied to an acid having the formula $C_{17}H_{33}O_2$, which is said to occur in adipocere (q.v.), and which may also be prepared by boiling cetyl cyanide in alcoholic potash. It was formerly given to a supposed acid having the same formula, which was believed to occur in connection with the saponification of natural fats; but it has been shown by Heintz that the earlier "margaric acid" was merely a mixture of palmitic and stearic acids.

Mar'garin, or **Margarine**, a fatty substance, obtained from lard, and from certain vegetable oils. It was formerly believed to be a distinct fat, or compound of glycerin with "margaric acid" (q.v.); but it is now known to be merely a mixture of stearin and palmitin. See **OLEO-MARGARINE**.

Margarit, or **Marguerit**, **Berenger**, a Spanish general, who lived in the 12th century. In command of a fleet he was sent by William II., king of Sicily, to succor Tyre, besieged by Saladin in 1188. Margarit, with a fire-ship, burned several of the enemy's ships, while Conrad, governor of Tyre, made a sortie. Attacked on both sides at once, Saladin only just managed to find shelter on an undamaged ship, and escaped. The brilliant conduct of Margarit on this occasion gained for him from Saladin the names of King of the Sea and the New Neptune.

Margarit, or **Marguerit**, **John**, a Spanish cardinal: b. Gerona 1415; d. Rome 1484. Successively bishop of Elne, of Gerona, and of Patti (Sicily), he received several important missions under Alphonse V., and became ambassador to Rome under John II., who appointed him chancellor of Aragon. He quelled the troubles which were disturbing Catalonia, and received the cardinal's hat in 1483. He was the author of 'Paralipomenon Hispaniæ' (Granada 1545), a history of Spain from the fabulous arrival of Hercules in the Peninsula, to the reign of Theodosius the Great.

Margarit, or **Marguerit**, **Peter**, a Spanish navigator who lived at the end of the 15th century. He was the nephew of Cardinal Margarit, and left the court of Ferdinand V. in 1492, to embark with the fleet of Christopher Columbus, from whom he separated after some dissensions. According to Blasius he discovered the Marguerite Islands, and gave to them his name. Other authors aver these islands were named after the pearls which are found on their shores.

Margarita, mär-gä-rë'tä, Venezuela, an island off the northeast coast, in the Caribbean Sea, about 30 miles north of Cumana. In 1901 it was made a province and is known by the name of Nueva Esparta. Its area is 450 square miles. This island was discovered by Columbus in 1498. The name Margarita, meaning "pearl" was given to it because of the valuable pearl fisheries once found in its surrounding waters.

The surface is broken by two mountain chains, the highest point of one is nearly 4,000 feet. Near the centre is a lagoon, surrounded by low land. Much of the soil is fertile, but the chief industries are fishing, preparing salt for market, and cattle-raising. The capital of the province is Asunción. The inhabitants are nearly all Indians who have long been civilized. Pop. about 40,500.

Margarite, or **Pearl Mica**, a native hydrous silicate of aluminum and calcium, having the formula $H_2CaAl_2Si_2O_{13}$, and usually occurring in laminated forms, like mica. Its crystals, when they occur, belong to the monoclinic system. Margarite is translucent or sub-translucent, with a vitreous or pearly lustre. It occurs in various colors, but predominantly in gray, with perhaps a reddish tint. It has a hardness of from 3.5 to 4.5, and a specific gravity of about 3. Margarite usually occurs in connection with emery or corundum, from which it is often obviously derived.

Margaritone, Italian painter, architect, and sculptor: b. Arezzo 1219; d. 1280. Called **MARGARITONE D'AREZZO** after his native place, he attained the first rank as an artist of the Greek school, and was held in high esteem by Pope Urban IV. Jealousy at the success of Cimabue is said to have shortened his days. He painted a great number of frescoes, none of which now exist. Among the few remaining pictures from his brush are Saint Francis in the museum at Siena; a Madonna in the Church of Saint Francis at Arezzo; Christ, in the Church of San Croce at Florence; the Eternal Father with the angels in the Church of Saint Bernardin at Perugia. Painting and sculpture are mingled in his Tomb of Pope Gregory X. at Arezzo; his sculptured works are chiefly of wood. Among his architectural works are the cathedral of his native city and the governor's palace at Ancona.

Margate, mär'gät, England, a seaport and popular summer watering resort of Londoners, in Kent, on the Isle of Thanet, 64 miles by rail east by south of London. The restored parish church of Saint John the Baptist dates from 1050. Margate is patronized annually by about 200,000 visitors. Pop. (1901) 23,057.

Margate-fish, a handsome, pearly white, brown-striped fish (*Hamulon album*) of West Indian waters, important as a food-fish, and ordinarily weighing about five pounds. It is caught about rocky reefs, in deep water, where it spawns in summer; and at night it comes in shore to obtain the small animals which swarm in the shallows. It is called jallao by Spanish-speaking fishermen, and market-fish, margaret-grunt, etc., by the English-speaking fishermen of Key West and the Bahamas.

Mar'gay, a South American forest-dwelling wildcat (*Felis tigrina*), which is most variably colored and spotted. It is sometimes domesticated in Brazil.

Margherita, mār-gā-rē'tā, queen dowager of Italy: b. Turin 20 Nov. 1851. She is the daughter of Ferdinand, Duke of Genoa. In 1868 she was married to Humbert, then crown prince of Italy, who ascended the throne of Italy in 1878. In that same year an attempt was made upon the life of the king, and the nervous shock to the queen seriously affected her health for a number of years. Her winning personality and dignified performance of her duty as queen gained her wide popularity in Italy. In 1900 her husband was assassinated and their son, Victor Emmanuel III., succeeded him as king.

Margoliouth, mār-gō'li-oot, **David Samuel**, English Oriental scholar: b. London 17 Oct. 1858. He was educated at Winchester and Oxford and has been professor of Arabic at Oxford from 1889. Among his published works are: 'Analecta Orientalia at Poeticam Aristotelem' (1888); 'Chrestomathia Baidwiana' (1894); 'Letters of Abul 'Ala' (1898); 'Lines of Defence of the Biblical Revelation' (1900); 'Religions of Bible Lands' (1902).

Margrave (German, *Markgraf*), in mediæval times in continental Europe, a commander intrusted with the protection of a *mark*, or district on the frontier. As early as the times of Charlemagne marks and margraves appear. The margraves stood immediately under the German kings and emperors. In the 12th century margraviates became hereditary, and at last the margraves acquired the rank of princes of the empire, between counts and dukes.

Marguerite, mār'gē rêt, a popular name for several flowers of the order *Compositæ*. The blue *marguerite* (*Felicia amellodes*), or blue daisy, is a native of southern Africa, and has long been popular in greenhouses and window gardens because of its simple culture and large solitary flower-heads. The Paris daisy or *marguerite* (*Chrysanthemum frutescens*), a native of the Canary Islands, was introduced into cultivation in Great Britain about the close of the 18th century and has continued a popular florist's flower ever since. It is the one usually obtainable throughout the year in the stores, but especially during the winter. Because of a close resemblance, the name is applied to its near relative, the ox-eye daisy (*C. leucanthemum*), which is common in mismanaged pastures and fields especially in the New England and adjacent States. The *Reine marguerite* (*Callistephus hortensis*), is better known in America as *China aster* (see *ASTER*) and is one of the most popular out-of-door annuals of the garden, being easily grown from seed and readily adaptable to any garden soil. The English daisy (*Bellis perennis*) is also called *marguerite*, but less frequently. See *DAISY*.

Maria Christina, ma-rē'ä krīs-tē'nä, queen of Spain: b. Naples 27 April 1806; d. Havre, France, 22 Aug. 1878. She was a daughter of Francis I., king of the Two Sicilies and was married to Ferdinand VII. of Spain in 1829. Upon Ferdinand's death in 1833, Maria Christina by her husband's will became regent until her daughter, Queen Isabella, should become 18. A civil war which was waged until 1840 ensued, its purpose being to place Don Carlos on the throne, and its outcome was for a long period doubtful, but the queen-regent appeared to care only for her chamberlain, Don Fernando Muñoz, with whom she secretly contracted a morganatic

marriage. Her policy as regent was entirely subject to the will of the minister of the day which naturally resulted in a reign alternately liberal and despotic. When she affixed her signature to the law concerning the *Ayuntamientos* the public protested so strongly that she was obliged to resign the regency to the prime-minister Espartero in 1840. In 1843, after the fall of Espartero, she returned to Madrid and in 1844 publicly married Muñoz, who was made Duke of Rianzares. A revolution in 1854 compelled her to flee the country and her return to Spain in 1864 was followed by the revolution which dethroned Queen Isabella in 1868 and she was again exiled and though allowed to return to Madrid after the accession of Alfonso XII., she died in exile.

Maria Christina, queen of Spain: b. Austria 21 July 1858. She was an Austrian archduchess, daughter of Archduke Karl Ferdinand of Austria and was married by proxy to Alfonso XII. of Spain in 1879. At the death of Alfonso XII. in 1885, she was appointed queen-regent during the minority of her daughter Queen Mercedes, who was succeeded six months later by Alfonso XIII., a posthumous son. The queen-regent faced a difficult problem; she was a foreigner, the people were unsympathetic, and the political and financial condition of the country was in a precarious state. She formed a new cabinet with Sagasta, the Liberal leader at its head, and soon won the hearts of her people by her wise and able rule. Throughout the time of her regency she commanded the respect and admiration of the world as well as her own country for her clear far-sighted administration of the affairs of state and her careful training of the young king whom she endeavored to inspire with her own high sense of the responsibilities of his position. Even the disastrous outcome of the Spanish-American war failed to unsettle the stability of her government which on 17 May 1902 she surrendered into the hands of her son, Alfonso XIII.

Maria II. da Gloria, dā glō'rē-ä, queen of Portugal: b. Rio de Janeiro, 4 April 1819; d. Lisbon 15 Nov. 1853. She was a daughter of Dom Pedro I. of Brazil and on the death of her grandfather, John VI. of Portugal in 1826, her father ceded to her the succession to the throne. Her uncle, Dom Miguel, to whom she was betrothed was appointed regent, but in 1828 upon the sailing of the young queen for Spain he usurped the throne and barred the landing of the queen. In 1832-3 Dom Pedro instigated a civil war against his brother and through the intervention of England and France, Maria was placed on the throne in 1834. She married Duke Ferdinand of Saxe-Coburg and though retaining her throne had a troubled and rather unsuccessful reign. Upon her death her son Pedro V. ascended the throne.

Maria Leszczyńska, lēs-chīn'skă, queen of France: b. Breslau 23 June 1703; d. Versailles 24 June 1768. She was a daughter of Stanislas Leszczyńska, king of Poland, and shared the obscurity which followed upon his exile. Her marriage to Louis XV. in 1725 was arranged by the regent Duc de Bourbon and the minister Fleury and was regarded as an intrigue to further their interests since it antagonized Spain by sending back the young infanta with whom an alliance had been projected. The queen after

MARIA LOUISA—MARIANA

a brief period in which she tried to control state matters lived very quietly and was noted for her charities. Consult: d'Armaille, 'La Reine Marie Leszczyńska' (1870); Des Reaux, 'Le Roi Stanislas et Marie Leszczyńska.'

Maria Louisa, loo-ê-ză, second wife of Napoleon I.: b. 12 Dec. 1791; d. Vienna 17 Dec. 1847. She was the eldest daughter of the Emperor Francis I. of Austria and Maria Theresa, daughter of Ferdinand, king of Naples. Her marriage with Napoleon in 1810, after his divorce from Joséphine, seemed to promise permanency to his dynasty and peace to the Continent, and her progress toward Paris through the different provinces of the kingdom formed a kind of triumph. In 1811 she bore him a son, to whom was given the title of King of Rome. In 1813, during Napoleon's absence at the war, he named her regent of the kingdom. After his overthrow she returned to Vienna, and remained there during the Hundred Days. In 1816 she received, with the title of Imperial Majesty, the Duchies of Parma, Piacenza, and Guastalla, and at a later period made a morganatic marriage with her chamberlain, Count Neipperg. She governed her duchies generally with mildness, but the latter part of her reign was much disturbed by revolutionary outbreaks and the very violent means taken to repress them.

Maria Louisa, Order of. See ORDERS AND DECORATIONS.

Maria Theresa, tē-rē-sa (Ger. tã-rã-ză), German empress, queen of Hungary and Bohemia, archduchess of Austria: b. Vienna 13 May 1717; d. there 29 Nov. 1780. The oldest daughter of the emperor Charles VI., she was carefully educated, was named heir to the throne by the Pragmatic Sanction, and in 1736 married Stephen, duke of Lorraine, who became grand-duke of Tuscany in the next year, and who in November 1740, a month after Maria's accession to the throne of Hungary, Austria and Bohemia, was named joint regent with her. France and Bavaria invaded Bohemia; and at the same time she was beset by Frederick the Great in Silesia, by Spain and Naples in Italy, and by the counter claims of Charles Albert, who was proclaimed first archduke of Austria and then German emperor. She fled from Vienna to Presburg, convoked the Diet, raised a Hungarian army, won the alliance of England, made a secret peace with Prussia, surrendering Silesia and Glatz, and gained peace by the treaty of Aix-la-Chapelle, October 1748, securing the election of her husband as German emperor in return for the cession to Spain of Parma, Piacenza and Guastalla. To revenge herself on Frederick she formed an alliance with Russia, and, by the help of her chancellor, Kaunitz, with France. With the further help of Sweden and Saxony she was preparing to strike at Prussia, when Frederick forestalled her by striking the first blow and opening the Seven Years' War (q.v.). This terrible struggle availed Austria nothing and Maria Theresa had to admit Prussia's right to Silesia in the Peace of Hubertsburg 15 Feb. 1763. Francis I., her husband, died 18 Aug. 1765, and Maria associated with her as emperor her oldest son, Joseph II., but kept in her own hands everything save military administration. Seven years afterward, upon the first partition of Poland, she received Galicia and Lodomeria; and in 1775 Bukovina was granted to Austria

by Turkey. The Peace of Teschen, closing the War of the Bavarian Succession, brought Austria the Inn valley in 1779; but the Princes' League (Fürstenbund) under the lead of Frederick II., struck a heavy blow at Austrian supremacy. Though best known for her part in European politics, Maria Theresa was equally great in interior administration; Austrian finance was revived, agriculture encouraged and higher education fostered. The Empress was a strict Catholic and an enemy of the Protestant Reformation, but in the latter part of her reign under the influence of her free-thinking son's policies, she was induced to enact some anti-ecclesiastical legislation, which he subsequently developed into persecutions. She was a pure and noble woman, strikingly beautiful in her youth. Ten of her 16 children survived her. Monuments to Maria Theresa are to be found in Klagenfurt, Vienna, and Presburg. Her letters to her children and her friends were edited by Arneth (1881), who wrote 'Maria Theresa' (1888). Consult also de Broglie, 'Marie Thérèse' (1888); de Villermont, 'Marie Thérèse' (1895); Wolf and Zwiedineck-Südenhorst, 'Oesterreich unter Maria Theresa' (1884); Bright, 'Maria Theresa' (1897).

Maria Theresa, Order of. See ORDERS AND DECORATIONS.

Mariamne, mǎ-rĭ-ām'nē, granddaughter of Aristobulus and Hyrcanus, the high-priest, and wife of Herod the Great. Her history is related by Josephus from whom we learn that Herod was devotedly attached to her. She was condemned to death through the machinations of Salome, her husband's sister, on a false charge of adultery, 28 B.C. She met her fate with an intrepidity worthy of her noble ancestry, and was bitterly deplored by the king after her decease.

Mariana, Juan, hoo-ān' mǎ-rē-ā'nā, Spanish historian: b. Talavera 1536; d. Madrid 17 Feb. 1623. Taking holy orders he entered the Society of Jesus. To his training at the University of Alcalá he owes the pure taste and eloquence of his writings. He taught theology for 13 years with distinction in Rome, Sicily, and Paris, returning to the Jesuits' College at Toledo in 1574, where he wrote his 'Historia de Rebus Hispaniæ' (first edition, Toledo, 1592), in elegant Latin, but afterward translated it into Castilian. His tone is impartial, though he loves Spain and admires Spanish virtue. Though a Jesuit he complains of Pope Alexander VI. Though a Spaniard he is not blindly prejudiced in favor of his king. He describes with sorrow the conquest of Naples; and his censure of Ferdinand is moderated only by considering his good qualities as personal, his bad ones as common to all princes. He has not, however, much claim to originality and borrows largely from Zurita (q.v.). Four editions of the translation appeared during his lifetime, each with corrections and additions. An English translation was made by Stephens, the continuator of Dugdale's 'Monasticon' (London, 1699, folio).

Mariana, mǎ-rē-ā'nā, in American colonial history, a name given by John Mason to the tract or territory granted to him between the Salem River and the Merrimac. Here he founded an agricultural settlement and formed the Laconia company in 1629. Mason returned

to England in 1633 and died there two years later. In 1691 his heirs sold all his lands and rights in New Hampshire to Gov. Allen.

Mariana (mā-rē-ā'nā) Islands. See **LA-DROÑE ISLANDS**.

Marianna, mā-rī-ā'nā, Ark., town, county-seat of Lee County; on L'Angeuille River, and on the Saint Louis, Iron Mountain & Southern railroad; about 158 miles east of Little Rock. It is in a fertile agricultural region in which cotton is one of the principal crops and in the vicinity are large forests. The chief industrial establishments are lumber-mills, cotton-gins, cotton-compresses, and cottonseed-oil mills. The town is at the head of navigation and has considerable trade by steamers and railroad. The town owns and operates the waterworks. Pop. (1900) 1,707.

Mariazell, mā-rē-ā-tsēl', Austria, a picturesque mountain village in the north of Styria, near the Salza, 60 miles southwest of Vienna. It is a noted pilgrim resort, annually visited by about 200,000 persons, attracted by the celebrated image of the Virgin and child, enshrined in a handsome church founded in 1363, and rebuilt in 1827. Pop. (1890) 1,152.

Maribois. See **NAGRANDIANS**.

Maribojoc, mā-rē-bō-hōk', a pueblo of the province of Bohol, situated on the southwestern coast on Maribojoc Bay, eight miles north of Tagbilaran, two miles from the mouth of the Abalan River. It is an important road centre. Pop. 10,900.

Maricopa, mā-rē-kō'pā, or **Coco-Maricopa**, an Arizona tribe of Indians, a branch of the Yumans, formerly inhabiting the region around the confluence of the Gila and Colorado rivers. Their descendants and the Pimas, with whom they subsequently confederated, are now to be found in the Gila River Reservation to the number of about 400. In their aboriginal state their dress was of the scantiest description, and their dwellings and storehouses were of woven straw and cornstalks over a pole framework. They were an agricultural people and raised large crops by irrigation. Under missionary influence they have been civilized and are now noted for their industry, their efforts at self-improvement, and their manufactures of cotton cloth, baskets, and pottery.

Marie Antoinette, mār'ī ān-toi-nēt' (Fr. mā-rē ān-twā-nēt), queen of France: b. Vienna, Austria, 2 Nov. 1755; d. Paris 16 Oct. 1793. She was the daughter of the Emperor Francis I. and the celebrated Maria Theresa. She left Vienna for Versailles in 1770, when only 15 to marry the young Duc de Berri, afterward Louis XVI. of France. When her husband ascended the throne in 1774, she gained the affections of the people by repeated acts of generosity. It was, however, soon observed that her natural freedom of manner brought on her the criticism of enemies about the court. It was thought, too, as many believe, with reason, that she was to a certain extent controlled by her mother as an Austrian spy. An extraordinary occurrence added fresh force to calumny and tarnished the fair name of the queen, who was not to blame. This was the affair of the "Diamond Necklace," in which the Cardinal Louis de Rohan, the great quack Cagliostro, and the Countess de Lamotte were the chief actors. It

was certain that Marie Antoinette had great influence over the king, and that she constantly opposed such measures of reform and economy as had been proposed. Her extravagance was regarded by the people as one of the chief causes of their poverty. Her unpopularity increased, and the general indignation was raised to the highest pitch by the enthusiastic reception given her at the banquet on 1 Oct. 1789, where the white Bourbon cockades were worn and the national cockade trampled under foot. The insurrection of women, the attack on Versailles, and the transfer of the royal family to Paris followed in a few days. It was the queen who advised the flight of the royal family from Paris to join Bouille's army in June 1791, which ended in their capture at Varennes. From that time they were viewed as traitors. On 10 Aug. 1792, the last day of the royalty, the queen exerted all her power to induce the king to resistance. This he thought was vain, and he was led with his consort before the legislative assembly. She heard his deposition announced, and then accompanied him to the prison of the Temple. There, deprived of every semblance of royalty, she displayed magnanimity and patient endurance. In August 1793, she was removed to the Conciergerie, and in October was brought before the revolutionary tribunal. She was charged with having dissipated the finances, exhausted the public treasury, corresponded with foreign enemies of France, and favored its domestic foes. She replied with firmness and decision, and heard her sentence pronounced with perfect calmness. On the same day she was guillotined. Marie Antoinette's faults were due in great measure to her defective education and difficult position. Her expiation of them made her a general object of pitying interest. Consult: Lescure, 'La vraie Marie Antoinette' (1863); Campan, 'The Private Life of Marie Antoinette' (1887); and Bicknell, 'The Story of Marie Antoinette' (1897).

Marie de France, mā-rē dé frāns, French poetess of the 12th century, a native of Ile-de-France, whence her surname, who spent her life in England, where she was well known at the court of Henry II. Her 'Lais,' largely based on Breton stories, and full of Celtic spirit and pathos; fables, a revision under the title 'Isopet' (that is, *Æsop*) of an English collection; and a tale, 'Le Purgatoire de St. Patrice,' make up the body of her work. The 'Lais' are edited by Warnke (1900), and the 'Purgatoire' by Jenkins (1894); each edition has a valuable preface.

Marie Galante, gā-lānt, West Indies, an island, one of the Lesser Antilles, belonging to France, about 15 miles southeast from Guadeloupe. The area is about 60 square miles. The chief productions are sugar, coffee, tobacco, indigo, and cotton. It is a dependency of Guadeloupe. Columbus discovered it in 1493, and named it from his vessel, the Santa Marie. The French occupied it in 1647, and lost it several times. In 1825 it suffered severely from the hurricane which desolated Guadeloupe. Pop. 14,268, chiefly negroes.

Marie de Médicis, dé mā-dē-sēs, queen of France: b. Florence 26 April 1573; d. Cologne 3 July 1642. She was the daughter of Francis I., grand-duke of Tuscany, and was married by proxy, 5 Oct. 1600, to Henry IV. of France, with

MARIE PAULINE — MARIETTA

whom she constantly quarreled, partly because of his inconstancy and his open favor to the Marquise de Verneuil, and partly because of her own haughty, obstinate character, which was not unminged with ambition. For years she urged him to have her crowned queen; the ceremony took place 13 May 1610, and on the next day the king was assassinated. Marie was accused of complicity in the plot, but the charge is not proven. For seven years she acted as regent and showed a strong friendship for Spain and the Catholic Church, being advised by the nuncio and the Spanish ambassador as well as by such favorites as the Concinis. She quarreled with her son, later Louis XIII., was reconciled to him by Richelieu, and upon her attempt to displace the latter was forced by that great minister again to leave court in 1630. Her last years were spent in exile in Belgium, England, and Cologne. The story of her poverty during these years is untrue. Consult Miss Pardoe, 'Life and Memoirs of Marie de Medici' (1852); Lord, 'The Regency of Marie de Médicis' (1903).

Marie Pauline, Princess Borghese. See BORGHESE, MARIE PAULINE.

Marienburg, mǎ-rě-ě-n-bād, Austria, one of the most frequented and picturesque of the Bohemian watering-places, near the western frontier, in a kind of triangular basin formed by several mountain ranges, about 28 miles northwest of Pilsen. The village, built on a slope, surrounded with woods of pine and fir-trees, except in front, has a town-house with assembly-room and reading-rooms; several bathing establishments, theatre, etc. The springs utilized are eight in number and are cold; some are alkaline and containing Glauber's salts, others alkaline and chalybeate, etc. Seven are used externally and internally, one is used for bathing alone. Great quantities of the water are exported. Pop. (1900) 4,588.

Marietta, mā-rĭ-ě't'a, Ga., city, county-seat of Cobb County, on the Nashville, Chattanooga & Saint Louis railroad; about 20 miles north by west of Atlanta. Kenesaw Mountain (q.v.) is west of the city. It was settled about 1840-1 and incorporated in 1852. A city charter was granted in 1885. It is in a fertile agricultural region in which stock-raising is one of the prominent occupations. Large marble quarries are in the vicinity. The chief manufactures are chairs, dressed marble, and machine-shop products. The chief buildings are the churches and schools. The Clarke Library, which contains about 5,500 volumes, is in Marietta. A National Cemetery located here contains the graves of 10,279 soldiers; the unknown dead number 2,967. The mayor and council are chosen at a popular election. Pop. (1890) 3,384; (1900) 4,446.

Marietta was an intermediate objective point in Gen. Sherman's campaign for Atlanta, and when he crossed the Etowah 23 May 1864, his columns were headed for that place by way of Dallas and New Hope Church, but Gen. J. E. Johnston threw his army in his front and checked him at New Hope Church and Dallas. After many hard-fought battles and constant severe skirmishing, Johnston abandoned his Dallas lines (see DALLAS, GA., BATTLE LINES AT) on 4 June, and took position covering Marietta, his left on Lost Mountain, his right beyond the railroad and behind Noonday Creek, with a strong advanced

position on Pine Mountain. Sherman repaired the railroad, established a secondary, fortified base at Allatoona Pass, and joined by Blair's Seventeenth corps, advanced 10 June and confronted Johnston in his new and strong position, and by the 14th was strongly intrenched before it in a continuous line of 10 miles. Johnston abandoned Pine Mountain on the night of the 14th, and Sherman advanced his lines, bringing on the engagement at Pine Mountain (q.v.) 15 June. The general movement was continued on the 16th and the right thrown forward to threaten the railroad below Marietta. On the 18th Johnston fell back to a new line, including Kenesaw Mountain, which was strongly fortified, and Sherman pressed in closely on the centre and left, north of Marietta, still continuing the extension of his line to the right, south of it. Johnston, making a corresponding movement by his left, encountered Sherman's right at Kolb's Farm (q.v.) on the 22d. Sherman assaulted Kenesaw Mountain (q.v.) on the 27th, and was repulsed. Flanking operations were then renewed to the right to reach the railroad, and Johnston, finding it in danger and his communications with Atlanta threatened, after being 26 days under an uninterrupted cannonade and infantry fire, abandoned Marietta on the night of 2 July and fell back to a new line, previously selected and intrenched, ten miles south of Marietta, and covering the railroad and his pontoon-bridges across the Chattahoochee, with an advanced position at Smyrna Camp-ground. Sherman occupied Marietta on the morning of 3 July. The Union loss in the operations around Marietta was 1,790 killed and missing, and 5,740 wounded, an aggregate of 7,530. Johnston reported a Confederate loss of 468 killed and 3,480 wounded. Consult: 'Official Records,' Vol. XXXVIII.; Sherman, 'Memoirs,' Vol. II.; Van Horne, 'History of the Army of the Cumberland,' Vol. II.; Johnston, 'Narrative.'

Marietta, Ohio, city, county-seat of Washington County, on the Ohio River at the mouth of the Muskingum, and on the Cleveland & M., the Toledo & O. C. Extension, the Baltimore & O. S. W., the Zanesville & O., and the Columbus N. R.R.'s; about 95 miles, in direct line, southeast of Columbus, the capital of the State. The first settlement was made in 1788 by people from New England, under Gen. Rufus Putnam, acting for the "Ohio Company" (q.v.) who had secured a grant of lands on both sides of the Muskingum River. The place was named in honor of Marie Antoinette. Arthur Saint Clair organized here July 1788 the Northwest Territory (q.v.). In 1800, Marietta was incorporated as a town. Fort Harmar, built in 1785, was opposite Marietta, and in 1890 the village of Harmar, once the site of the fort, was annexed to the city. The building used as the land office for the "Ohio Company" and an old church, the oldest in the State, are still standing here and in good condition. Many of the pioneers of New England as well as of Ohio, and many of the Revolutionary soldiers, were buried in the Marietta cemetery.

The city is in a coal, iron, petroleum, and gas region, with fertile agricultural lands in the valleys. Some of the manufacturing establishments are the chair factory, employing 650 persons; glassworks, employing 200; tool shops, with 150 employees; brick plant, 300 employees;

MARIETTA COLLEGE — MARINE INSECTS

boat yards, 75; foundries, 300; other manufacturing having in all fully 300 more employees. There are five banks with a combined capital of \$500,000; the annual business amounts to over \$3,000,000. The principal buildings are the Marietta College (q.v.), public and parish schools, the churches, and the county-buildings. The government is vested in a mayor and council and is administered according to the "Ohio Municipal Code." The council is composed of six members, two of whom are elected each year. The site of Marietta was once part of a remarkable group of ancient works which consisted of two sections, one containing about 40 acres, the other about 20 acres. The remains of mounds, truncated pyramids, walks, walls, and other ancient works still exist, although the city covers a large part of the original enclosures. Remains of the walls, about five or six feet high by 20 or 30 feet base, may still be seen. Pop. (1890) 8,273; (1900) 13,348. Consult: King, 'History of Ohio'; Hoar, 'Oration at the Celebration of the Centennial of the Founding of the Northwest at Marietta.'

A. D. ALDERMAN,
Editor of Marietta 'Register.'

Marietta College, in Marietta, Ohio, founded in 1835 for men and women. It has college and preparatory departments, the latter is known as Marietta Academy. The courses lead to the degrees of A.B., Ph.B., and B.L. Courses are provided for work in music, art, and military science, and short summer schools are given for work in the arts and sciences. The library, which has about 61,000 volumes and 30,000 pamphlets, is noted for its books on the history of the Northwest. In 1903 there were connected with the college 24 instructors and about 300 students. The grounds and buildings were valued at \$251,000, the productive funds at \$266,000, and the total income \$22,500.

Marigold, a popular name for several unrelated plants. The pot marigold (*Calendula officinalis*) is one of the most widely popular of garden plants. It is grown for its brilliant flowers which range from white to rich orange, and for its flower-heads, which are often used to flavor soups, stews, and dressings. The African marigold (*Tagetes erecta*) and the French marigold (*T. patula*) are also widely used for ornament. Their flowers are usually some shade of yellow, but some are brown and some striped. The Cape marigold (*Dimorphotheca* spp.) are also grown for ornament but are less popular than the above. The corn-marigold (*Chrysanthemum segetum*) is a weed especially common in European grain-fields, but also cultivated for its flowers, for which the plant is sometimes forced in greenhouses. All these belong to the natural order *Compositæ*. The marsh marigold (*Caltha palustris*) is a member of the natural order *Ranunculaceæ*. It is a well-known plant in marshes and wet meadows. The leaves, gathered before flowering, are widely used as a pot-herb under the name of "cowslip greens." The name fig marigold is applied to various members of the genus *Mesembryanthemum*, several of which are cultivated for their grotesque forms, their peculiar foliage, etc.

Mariquina, mār-i-kā'na, a Brazilian name for a marmoset (q.v.).

Marinduque, mā-rên-doo'kā, Philippines, an island lying southwest of the province of

Tayabas, Luzon; it is circular in shape, being 24 miles north and south and 23 miles east and west; area 667 square miles. A mountain range runs from north to south across the island, and near its centre are short spurs running east and west. The staple products are rice, coconuts and hemp; the island is heavily wooded, and fruits are abundant and an important article of food among the natives. The chief industry is the raising of rice, of which large quantities are exported, the hemp of Marinduque is of a peculiar fine quality, and is used for weaving. At the southern end of the island there is excellent pasturage, and horses and cattle are raised. It is in the route of steamers in the local trade between Manila and the Visayan Islands and Mindanao, and its two chief towns are ports of call for these steamers. In the winter of 1898-9 Marinduque was occupied by the United States troops, it being the first important position in the south taken after leaving Verde Passage. In 1901 it, with the small islands adjacent, was created a province under civil government; 23 June 1902 the provisions of the provincial government act were extended to the island of Mindoro and the Lubang group by incorporating them with the province of Marinduque. Pop. 48,000, mostly Tagalogs.

Marine Insects. Insects have not only invaded rivers and lakes, they have established themselves to some extent at least, along the margin of the sea. On a sunny day by the shore myriads of flies may be seen hovering over the seaweed cast up by the tide. These have been developed from grubs which live and feed in the decaying weed, and are able to bear immersion twice daily. Around the rock-pools many mudges may be noticed. Their grubs feed on growing green seaweed, and spend their whole life in the salt water, breathing the dissolved air, as do their fresh-water relations, by means of gill-filaments, or simply through the surface of the skin. Many species of beetles inhabit the shore, and are submerged twice daily, when they lurk under stones or burrow into the sand; their hairy bodies are not easily wetted, and in one of the best known marine beetles (*Aëpus*) there are paired air-sacs in the hind-body which are believed to act as reservoirs for breathing while the tide is up. Several kinds of very small springtails may be seen on the surface of the rock-pools at low-tide; probably when the water rises they retire into crevices of the rocks. They are covered with a very fine, dense pile, and it seems impossible to wet them.

The absence of wings is a common character among the sea-shore insects. The beetles of the genus *Aëpus* are wingless, and so is the small bug *Aëpophilus* often found in their company, as well as the female of the midge *Clunio*, whose mate, though winged, appears not to fly, but to use his wings as sails as he skims over the surface of the rock-pools. "The tendency of insects on oceanic isles to lose their wings has often been noticed," says Carpenter, "and the loss of the power of flight explained as an advantage, since insects which do not fly cannot be blown out to sea. Possibly the absence of wings in so many sea-shore insects can be explained in like

MARINE INSURANCE — MARION

manner. Several genera of pond-skaters have one or two species which frequent the water of estuaries and harbors; these are in all cases wingless, though their fresh-water relations are, as a rule, winged."

The extreme of adaptation to marine life is shown by the bugs of the genus *Halobates*, also belonging to the family *Hydrometridæ*, with their short anchor-like fore-legs and their immensely long and slender middle and hind-legs, the middle shin and foot being fringed with long hairs. The elongate wingless fore-body of these insects and the greatly reduced hind-body give them a most peculiar and characteristic appearance, and the dense pile wherewith they are clothed keeps them dry. They have been observed gliding over the calm seas of the tropics, often hundreds of miles from land, or clinging to drifting substances whence they could suck food. Consult G. H. Carpenter, 'Insects, their Structure and Life' (1899); Miall, 'Natural History of Aquatic Insects' (1895).

Marine Insurance. See INSURANCE, MARINE.

Marines, are troops enlisted for service either on board ship or on shore. They are drilled, disciplined, clothed, equipped, and paid similarly to the land forces. Their duties are to maintain the necessary guards, man some of the guns, form part of the armed crews of the various boats when called away for service, and form a permanent force for landing with the seamen if necessary. In all these matters they are commanded by their own officers. The marines of the European continental nations are not designed for service permanently on board ship; the American navy is the only one besides that of Great Britain in which the marine forms a necessary and definite fraction of a ship's company. United States marines, who are designated as the Marine Corps, distinguished themselves greatly in the operations in Cuban waters in 1898 and in those which led to the rescue of the foreign legations in Peking in 1900. The name marines is also used in the expression: "Tell that to the marines," signifying utter disbelief in a statement made or story told; it arose from the fact that marines, being ignorant of seamanship, were made butts of by the sailors. See NAVY OF THE UNITED STATES.

Marinette, măr-y-nēt', Wis., city, county-seat of Marinette County; at the mouth of the Menominee River, on Green Bay, and on the Chicago & N. W., the Wisconsin & M., and the Chicago, M. & St. P. R.R.'s; about 50 miles north by east of Green Bay and opposite Menominee, Mich. The harbor is large and safe, and the river affords opportunity for bringing logs from the forests along its upper course in both Wisconsin and Michigan. Marinette was settled about 1849-50 and in 1887 was incorporated. The water-power is extensive and the lumber industry of Marinette is most important. The large lumber mills are the chief manufacturing establishments of the city. Other industrial establishments are pail factories, paper and pulp mills, box and broom factories, gas and traction engine and iron works, threshing machine factories, furniture factories, and cabinet shops. The city carries on a lake commerce with all the important lake ports. The chief buildings are the city and county buildings, two hospitals, a public library, 20 churches, fine public and parish school

buildings, and Our Lady of Lourdes' Institute. In the vicinity is large assembly ground where various religious and educational conventions are held each summer. Pop. (1890) 11,523; (1900) 16,195.

Marini, Giambattista, jām-bă-tēs'tă mărē'nē, Italian poet: b. Naples 18 Oct. 1569; d. there 25 March 1625. He was assisted by the Cardinal Pietro Aldobrandini at Rome, with whom he went to Turin, where he became secretary to the Duke of Savoy, Charles Emmanuel, but the envy of his enemies and his satirical humor involved him in various disputes. Marini's most famous work is the long epic 'Adone' (1623). His other works include 'La Lira' (1602-14); and a great collection of miscellaneous poems. Some of his sonnets are among the most perfect in the Italian language. He is the founder of the Marinist school of poetry, of which false, overstrained imagery, far-fetched metaphors, and forced conceits are characteristic features. Consult Menghini, 'La vita e le opere di G. B. Marini' (1888).

Marinoni, Hippolyte, ē-pō-lēt mărē-nō-nē, French inventor: b. Paris 1825. He has invented many appliances for printing which have been of world-wide adoption, among them are a rotary printing-press which turned out 40,000 copies an hour, another which printed in six colors 20,000 copies an hour, and at the Paris Exposition he exhibited a press which printed at a rapid rate two colors on each side of a sheet by one revolution.

Mario, Giuseppe, joo-sēp'pē măr-rē-ō, MARQUIS DI CANDI, Italian tenor: b. Cagliari, Sardinia, 18 Oct. 1810; d. Rome 11 Dec. 1883. After serving in the Sardinian army he went to Paris, where after two years of musical study he was appointed first tenor of the opera, changing his name at the same time from De Candia to Mario. He made his debut 2 Dec. 1838 as Robert in 'Robert the Devil,' and soon became the leading tenor of the world. His répertoire embraced all the great works of Rossini, Bellini, Donizetti, and Verdi. He married the famous singer Giulia Grisi in 1854 and together they made an operatic tour of the United States. In his later years after his retirement from the stage in 1871 he lost his fortune through speculations, and the next year made a concert tour in this country.

Mariol'atry. See MARY.

Marion, măr'y-ōn, Francis, American soldier: b. near Georgetown, S. C., in 1732; d. Pond Bluff 27 Feb. 1795. He was the youngest in a family of six children. His grandfather, Benjamin Marion, was a Huguenot exiled from France in 1690. At 16 Francis showed his adventurous disposition by embarking on a small vessel bound for the West Indies. It was wrecked and he barely escaped death by starvation. He returned home and worked several years on a farm. In 1760-1 he served in campaigns against the Cherokees. Thenceforth until 1775 he lived on his plantation at Pond Bluff in the parish of St. John.

In 1775 Marion was elected member from St. John in the South Carolina Provincial Congress, which adopted the bill of rights and voted money for raising troops. He was chosen captain (21 June 1775) and took the field against the British and the Tories. He took part in the capture of Fort Johnson (14 Sept. 1775), and because of his ability in organizing and discipline was pre-

MARION

moted to major. He participated in the patriot victory (28 June 1776) at Charleston, which gave the Southern States respite from active fighting for nearly three years. Appointed lieutenant-colonel, he led his regiment in the unsuccessful attack on Savannah (September 1779). In 1780 Marion, now a brigadier-general, was obliged to take refuge in forest and swamp. Beginning with a handful of men, less than 20, he gathered recruits, fearless riders and good marksmen, who formed the famed "Marion's brigade." At times they numbered several hundred. They came and went at their leader's bidding, providing their own equipment and rations. Part of the time they were at work on their farms, planting crops. These rough and ready troopers became the terror of the British regulars and the Tories, although in justice to Marion's men it should be said that they committed no acts of wanton cruelty and burned no buildings on Tory homesteads. The stories of his adventures read more like fiction than history. His scouts kept close watch of the enemy's movements, and detachments of the brigade struck blow after blow, surprising and capturing small parties of soldiers. At times they united with larger bodies of troops for important engagements. After a vain pursuit, Tarleton, named Marion the "Swamp Fox." Failing in his attempt against Georgetown (December 1780), he retired to Swan Island and prepared for a second attack (13 Jan. 1781), which was also unsuccessful. Then he joined with Colonel Henry Lee in reducing Fort Watson (April 1781). After raiding 200 miles of country he commanded the first line in the battle of Eutaw Springs and took many prisoners. For his gallantry in this engagement he received the thanks of Congress. From 1782 to 1790 Marion served in the State Senate and was a member of the State Constitutional Convention in 1790. He opposed harsh treatment of the Tories and condemned the confiscation act of 1782. In 1784 he married a wealthy lady, Mary Videau, who survived him with no children. He was a man of attractive personality. Of slight figure, he was capable of great endurance and accustomed to abstinence. As a leader he was admired and beloved. He justly ranks among the heroes of the Revolution. Consult: *Biography* by Horry and Weems (1815), Simms, *Life of Francis Marion* (1844), Tarleton, *History of the Campaigns of 1780-1781* (1787).

Marion, Ala., town, county-seat of Perry County; on the Southern railroad; about 60 miles west by north from Montgomery. It is situated in a fertile agricultural region, and its industries are connected with the farm products. It is the seat of the Marion Female Seminary, established in 1836; the Judson Female Institute (Baptist), established in 1839; Lincoln Normal School for colored pupils (Congregationalist); and the Marion Military Institute. Pop. (1900) 1,698.

Marion, Ill., city, county-seat of Williamson County; on the Illinois Central railroad; about 150 miles south by east of Springfield. It is situated in an agricultural region in which are large deposits of coal and near which are extensive timber tracts. The chief industries which contribute to the support of the city are coal-mining, lumbering, fruit raising, manufacturing flour and raising cattle. Marion is the chief

trade centre of a large portion of Williamson and adjoining counties. Pop. (1890) 1,338; (1900) 2,510.

Marion, Ind., city, county-seat of Grant County; on the Mississinewa River, and on the Toledo, St. L. & K. C., the Cleveland, C., C. & St. L., the Cincinnati, R. & M., and the Pittsburgh, C., C. & St. L. R.R.'s; about 68 miles northeast of Indianapolis. It is situated in a fertile agricultural region and in a natural-gas belt, and the Mississinewa furnishes abundant water-power. The chief manufactures are flour, lumber, pulp, paper, brick, foundry products, window glass, bottles, glass jars, furniture, linseed oil, and rolling-mill products. The trade is extensive and is chiefly in its own manufactures and farm products. Some of the principal buildings are the public library, which cost \$65,000, a large normal college, a court-house, and the churches and schools. Three miles south of the city is a National Soldiers' Home, which cost about \$1,510,000. The electric-light plant and the waterworks are owned and operated by the city. Pop. (1890) 8,769; (1900) 17,337.

Marion, Iowa, city, county-seat of Linn County; on the Chicago, Milwaukee & Saint Paul railroad; about 110 miles northeast of Des Moines. It was settled in 1839 and in 1852 was incorporated. It is situated in a rich agricultural region in which the chief products are corn, broom-corn, wheat, and vegetables. Considerable attention is given to stock-raising. Marion is the headquarters of a railroad division and has large railroad repair shops, freight yards, and a round-house. Other industrial establishments are broom factories, greenhouses, flour mills, a large creamery, and cigar factories. Pop. (1890) 3,094; (1900) 4,102.

Marion, Kan., city, county-seat of Marion County; on the Cottonwood River, and on the Chicago, R. I. & P., and the Atchison, T. & S. F. R.R.'s; about 115 miles southwest of Topeka. It is situated in a fertile agricultural region in which considerable attention is given to stock-raising. The chief manufactures are flour and dairy products. Pop. (1890) 2,047; (1900) 1,824.

Marion, Ohio, city, county-seat of Marion County; on the Erie, the Cleveland, C., C. & St. L., the Columbus, H. V. & T., and the Pennsylvania R.R.'s; about 45 miles north of Columbus, the capital of the State.

Marion was settled in 1815 by people from Rhode Island, and was incorporated in 1820 and chartered as a city in 1890. It is situated in a fertile agricultural section; considerable limestone is in the vicinity. The number of employees engaged in the chief industries of the city are, in the steam-shovel works, 500 persons; the foundries, 300; the lime-kilns and quarries, 600; engines and threshers, 550; buggies, carriages, etc., 150; agricultural implements, 100; wood-pulleys, 50; silk-mills, 50; mattress factory, 20. There are 13 churches, public and parish schools, and a Home for Aged Women. The four banks have a combined capital of \$850,000. The government is vested in a mayor and a council of seven members, chosen annually by popular election. The inhabitants are chiefly native born. Pop. (1890) 8,327; (1900) 11,862.

W. G. HARDING,
Editor of 'Star.'

MARION — MARITZA

Marion, S. C., city, county-seat of Marion County; on the Carolina N., and the Atlantic C. L. R.R.'s; about 100 miles west of Columbus. It is surrounded by rich farm lands, the chief products of which are tobacco and cotton. It has large cotton mills, cottonseed-oil mills, lumber and flour mills, and foundries. It ships to the large markets considerable tobacco and cotton products. Pop. (1900) 1,831.

Marion, Va., town, county-seat of Smyth County; on the Marion & R. V., and the Norfolk & W. R.R.'s; about 140 miles southwest of Lynchburg. Marion was settled in 1832 and in 1871 was incorporated. The chief industrial establishments are flour and lumber mills and wooden-ware factories. Mining and quarrying in the vicinity contribute to the industrial wealth of the town. It is the seat of the Marion Female College (Lutheran) and the Southwestern State Hospital for the Insane. The water for drinking and domestic purposes is brought from springs in the hills about three miles distant, and the waterworks plant is owned and operated by the town. Pop. (1900) 2,045.

Mariotte, Edme, ěd-mě mā-rě-õt, French physicist: d. 12 May 1684. He lived for the most part at Dijon, and was made prior of Saint-Martin-sous-Beaune. He became a member of the Academy of Sciences upon its formation, and was one of the founders of experimental physics. "It is Mariotte," said Condorcet, "who first in France introduced into physics a spirit of observation and of doubt." He discovered independently the law known by his name—also discovered by Robert Boyle (q.v.) and known as Boyle's law,—that if the temperature remain constant, the volume of a gas will vary inversely as the pressure.

Mariotte's Law, in physics, the principle that the volume of a gas, under ordinary conditions of temperature and pressure, is sensibly proportional to the reciprocal of the pressure, so long as the temperature remains constant. It is identical with Boyle's law, the latter name being applied to it in the United States and England, and the former in continental Europe. See *Boyle's Law* under GASES, GENERAL PROPERTIES OF, and GASES, KINETIC THEORY OF.

Mariposa Lily, or **Butterfly Lily**, popular names for various species of *Calochortus* of the order *Liliaceæ*. The numerous species, all of which are natives of western United States and British Columbia, are characterized by coated corms; rather leafy, generally branched stems; and showy, six-segmented flowers. Almost all the species are in cultivation for ornament, some, natives of the Colorado desert, being suited to arid conditions, others to fairly moist soils, still others to very cold localities, as species indigenous to the mountains of Sierra Nevada. All will stand extreme cold, but not alternate freezing and thawing, hence their failure under such conditions. The bulbs should be planted in late autumn in any kind of soil. After the tops have become yellow subsequent to flowering in the following year the bulbs should be taken up, divided and kept dry until planting time. They are often grown in pots under glass.

Maris, mā'ris, Jakob, Dutch painter: b. at The Hague 25 Aug. 1837. He early began his art studies at the local academy, choosing land-

scape as a specialty, and receiving instruction from Ströbel and Van Hove, which latter he followed on his removal to Antwerp. He studied also under Keyser, director of the Antwerp Academy. Going to Paris he came under the influence of the Barbizon school, and reached his full power as a painter of figures and landscape in combination. In 1871 he returned to his native town. His brush work and use of chiaroscuro are essentially French. Among his numerous works are, 'View of Schiedam'; 'View of a Town in Holland'; 'On the Sea Shore'; 'Mother and Children'; 'Bridge and Canal in Rotterdam'.

Mariscal, Ignacio M., Mexican statesman: b. Oaxaca, 5 July 1829. He received his diploma as a lawyer in 1849, and practiced until 1857, when he was elected a member of the federal congress. Two years later he was made justice of the supreme court of Oaxaca, and in 1860 circuit judge of the states of Oaxaca, Veracruz and Puebla. In 1861 he was again elected to the federal congress, being assigned the additional duties and responsibilities of government assessor of church properties; served as justice of the supreme court in 1862; as sub-secretary of foreign affairs in 1863, and was appointed first secretary of the Mexican legation at Washington in August of that year; chargé d'affaires 25 Oct. 1867, secretary of justice and public instruction in 1868; envoy extraordinary and minister plenipotentiary at Washington 1 June 1869; secretary of foreign affairs 10 March 1871; envoy extraordinary and minister plenipotentiary at Washington June 1872; justice of the supreme court of the Federal District and director of the national school of jurisprudence July 1879; secretary of foreign affairs 22 Nov. 1886; special envoy to Great Britain May 1883 and envoy extraordinary and minister plenipotentiary October 1884; secretary of foreign affairs June 1885, a position which he still retains. He is also a member of the Geographical and Statistical Society of Mexico. He was closely associated with President Juarez throughout the War of the Reform, was secretary and legal counsel to the Mexican legation at Washington during the War of Intervention, and is the author of several historical and other works. Mr. Mariscal has received many decorations from foreign governments.

Marists, mā'rists, term applied to two modern religious congregations in the Roman Catholic Church. The Marist Fathers, or Society of Fathers of Mary, originated in Lyons (1816), where a number of religious devoted themselves to missionary work, which extended over the Pacific islands and in 1845 passed on to Australia. The Marist Brothers, whose object was the education of youth, were founded a year later at Marseilles, and chose for its field of labor the south of France. The Marist Fathers have 156 members in the United States which they entered 1849. Their headquarters is at Brookland, D. C. They have schools at Manchester, N. H.; Lowell and Lawrence, Mass., and New York.

Maritime Law. See LAW, MARITIME.

Maritza, mā-rět'sā, Turkey, a river, the ancient Hebrus, rising as the Topolnitsa, near the Bulgarian frontier, in the Balkan Mountains, and flowing through Eastern Rumelia, south-

east to Adrianople, where it bends to the southwest, and falls into the Ægean Sea by the Gulf of Enos. It is over 300 miles long, and navigable to Adrianople, about 100 miles from its mouth.

Marius, mā'ri-ŭs, **Gaius**, Roman general: b. 156 B.C., in Cereata, in the Volscian territory; d. Rome 86 B.C. He won his first military repute at Numantia in 134, beginning his rapid rise from the ranks; was made tribune of the people in 119; increased his political power by marrying Julius Cæsar's aunt; became prætor in 115; went to Spain in the next year, suppressing brigandage there; and in 109 accompanied Metellus to Africa. Two years later he was chosen consul, displaced his superior officer, and made a brilliant campaign. His success was so great that he was elected consul four times in succession (104-101 B.C.)—a proceeding counter to law and entirely unparalleled—so as to meet the invasion of Italy by the Cimbri and Teutones. He defeated the latter tribe at Aquæ Sextiæ in 102, and the Cimbri at the Raudian Fields in 101. In 100 he was again elected consul. He made the fatal mistake of plunging into party politics, allied himself with the most disreputable leaders of the popular party, and, in his envy of the rising fame of the patrician Sulla (q.v.), attempted to remove him from his command in the Jugurthine War. Civil war broke out in 88. Sulla was victorious. Marius fled to Africa, whence he returned to Italy on the successful rising in Rome under Cinna. The first great proscription followed and many of Marius' opponents were killed. Marius was elected consul for the seventh time for 86 B.C., but died soon after he entered upon the office. Consult Beesly, 'Marius and Sulla' (1878).

Marius, The Epicurean, a philosophical romance by Walter Pater, published in 1885. The book has but a shadowy plot. It is, as the subtitle declares, a record of the hero's "sensations and ideas," a history of a spiritual journey. Marius is a young Roman noble, of the time of Marcus Aurelius. Like the philosophic emperor himself, he is the embodiment of the finer forces of his day; his temperament being at once a repository of the true Roman greatness of the past, and a prophecy of the Christian disposition of the New Rome. In his earliest manhood he goes to Rome, meets there the philosophic emperor, mingles in the highly colored life of the time, studies, observes, reflects. The book is a remarkable story of spiritual development, as well as of the strange, luxurious, decaying Rome of the 2d century of the Christian era.

Mariut, mā-rē-oot', **Lake**, Egypt. See MAREOTIS.

Marivaux, Pierre Carlet de Chamblain de, pē-ār kār-lā dē shān-blān dē mā-rē-vō, French dramatist and novelist: b. Paris 4 Feb. 1688; d. there 12 Feb. 1763. Of his life practically nothing is known save that he became an 'Academician' in 1742 or 1743. He wrote essays in periodical form, the 'Spectateur Français' having a hint of English influence in both matter and name. His novels, especially the unfinished 'Vie de Marianne' and 'Payсан parvenu,' were a protest against the literary morals of contemporary fiction. But he is best known for such plays as 'Les Jeux de l'Amour et du Hasard' (1730), 'Les Fausses Confidences' (1738), 'Le Legs' (1736), and 'La Mère confi-

dente' (1735), which are marked by a total opposition to the style and manner of Molière, by much skill in intrigue and in portraying women, and by the peculiarly artificial and elaborate style, which takes its name 'Marivaudage' from the author. Consult: Savollée, 'Marivaux inconnu' (1880); Fleury, 'Marivaux et le Marivaudage' (1881); Gosset, 'Marivaux Moraliste' (1881); Larroumet, 'Marivaux, sa Vie et ses Œuvres' (1894); Deschamps, 'Maurivaux' (1897).

Mar'joram, a genus of annual or perennial herbs and a few shrubs (*Origanum*) of the natural order *Labiata*. The species of which there are about 25, are mostly natives of the Mediterranean region and southwestern Asia. They have several-flowered whorls of labiate flowers arranged in spikes. Two species are widely cultivated in gardens for culinary purposes, being used fresh, dried or in decoction for flavoring soups, stews, dressings, sauces and salads. Common or pot marjoram (*O. vulgare*) is a hardy perennial with pink or purple flowers and highly aromatic leaves. It succeeds best upon warm garden soils well exposed to the sun, and may be propagated by seeds, divisions, or cuttings. Sweet marjoram (*O. marjorana*) is also a perennial, but is tender and consequently treated as an annual, hence the popular name annual marjoram. It is usually raised from seeds sown in a hotbed or green-house and transplanted to ground like the above.

Mark, Saint, the Evangelist. See GOSPELS.

Mark Antony. See ANTONIUS, MARCUS.

Mark Twain. See CLEMENS, SAMUEL LANGHORNE.

Mark, an old English term for a money of account, and in some other countries for a coin. The English mark was valued at \$3.33, and the Scotch mark, or merk, was \$3.42. In the coinage of the German empire the mark is a coin of nearly the same value as the English shilling. A mark banco used to be a money of account in Hamburg equal to 37 cents, nearly. The mark was also used as a weight in several parts of Europe, being divided into 24 carats.

Mark, Order of Saint, a Venetian order of knighthood. The doge, as well as the senate, elected knights of Saint Mark, who enjoyed a pension. Foreigners also, particularly scholars, were elected. Saint Mark the Evangelist was the patron saint of the Venetian Republic.

Markham, mār'k'am, **Albert Hastings**, English admiral and Arctic explorer, cousin of Sir Clements Markham (q.v.): b. Bagnères, 11 Nov. 1841. He entered the navy in 1855, saw active service in the China Seas for several years, took part in the Polar expeditions of Adams (1873) and of Nares (1875), and in the latter expedition attained what was then the farthest north, 83° 20' 26". With Sir Henry Gorn-Booth he attempted to reach Franz Joseph Land in 1879, but was unsuccessful; in the next year Markham explored the Galapagos Islands. Rear-admiral in 1892 and second in command of the Mediterranean fleet in 1893, he is now a vice-admiral. He has written: 'The Cruise of the Rosario amongst the New Hebrides' (1873); 'The Great Frozen Sea' (1878); 'The Voyages and Works of John Davis' (1884); 'A Polar Reconnaissance' (1879); and 'Life of Sir John Franklin' (1891).

MARKHAM — MARKS' MILLS

Markham, Sir Clements Robert, English geographer and traveler: b. Stillingfleet, near York, 20 July 1830. He was educated at Westminster School, entered the navy in 1844, accompanied the Franklin Search Expedition of 1850, and then retired from the service. He traveled in Peru in 1852-4 and 1860-1, the second journey being undertaken to get cinchona seeds for planting in India, an experiment described in his 'Peruvian Bark; Cinchona Culture in British India, 1860-1880' (1880). After spending 1865-6 in Ceylon and India, he became secretary of the India Office in 1867 and curator of its Geographical Department in 1868. In 1858 he had been appointed secretary of the Hakluyt Society, of which he became president in 1890. Since 1863 he was secretary of the Royal Geographical Society, and in 1893 became its president. His more important works, several of which were translated into German, are: 'Cuzco and Lima' (1856); 'Travels in Peru and India' (1862); 'The Arctic Navy List' (1875); 'Life of John Davis' (1889, in a series, 'The World's Great Explorers'); 'Major James Rennell' (1895); 'Richard Hakluyt' (1896); and an English version of a Peruvian drama, 'Ollanta' (1871). He edited 'The Geographical Magazine' from 1872 to 1878 and was knighted in 1896.

Markham, Edwin, American poet: b. Oregon City, Ore., 23 April 1852. He spent his boyhood on a ranch in central California, herding cattle and sheep, and later graduated from the California State Normal School at San José and from Santa Rosa College. He studied law, but did not practise; subsequently took up educational work, and was superintendent and head master of schools in California, and principal of the Observation School of the University of California in Oakland. He had for some time been an occasional contributor to some of the leading American magazines, but first gained wide reputation through the publication of his poem, 'The Man with the Hoe,' suggested to him by Millet's picture of the same name. This first appeared in the San Francisco *Examiner* and was later published in a collection entitled 'The Man with the Hoe and Other Poems' (1899). This poem, which had a wide influence and caused much discussion, is intended by the author not merely as a picture of the peasant but as "a symbol of the toiler brutalized through long ages of industrial oppression." His other publications include: 'Lincoln and Other Poems' (1901); and 'Field Folk, Interpretations of Millet' (1901).

Markham, Jared Clark, American architect: b. Tyringham, Mass., 18 Nov. 1816. He designed the battle monument at Saratoga and has published 'Appeal to the American People in Behalf of National Monuments' (1872); 'Monumental Art' (1884); 'Historic Sculpture' (1886).

Markham, William, English colonial governor in America: b. England about 1635; d. Philadelphia 12 June 1704. When William Penn obtained a charter for Pennsylvania, he made Markham, a first cousin of his, his deputy. Markham had all rights granted to Penn save that of convoking a legislative assembly. On 3 Aug. 1681 he established a council, later chose the site for Philadelphia, and conferred with Lord Baltimore as to the Maryland-Pennsylvania

boundary. Penn himself arrived on 27 Oct. 1682, and Markham, whose commission accordingly lapsed, was elected to the council. In 1684-99 he was secretary to the province, in 1686 became land commissioner, and in 1689 an auditor of accounts. When in 1691 the territory now constituting the State of Delaware was detached from the province, he was appointed its deputy-governor, and in 1694-9, as lieutenant-governor, administered both this territory and the province.

Markhor, mār'kôr or -koor, a remarkable goat (*Capra falconeri*) of the mountains of Afghanistan and northwestern India, where it keeps among the highest wooded valleys, ascending and descending only as compelled to do so by the seasonal changes in the depth of the snow. It is of large size, standing about 3 feet tall at the shoulders, and is reddish brown in summer and light gray in winter. "The magnificent beard, extending in the adult males on to the chest and shoulders, and sometimes reaching nearly to the knees, is black in front and gray behind; in the young bucks and the does at all ages it is confined to the chin." The horns are very different from those of other goats, rising straight up from the forehead, spreading sideways, so as to form a V when seen from in front, and spirally twisted. Specimens have measured 50 inches along the spiral keel. Several distinct local varieties of markhor are known to the Himalayan hunters, who regard this animal as one of the most excellent objects of sport in that region of prime game animals. "Unlike the ibex, which keeps to the rugged crags and steep ravines above the limits of the forest, the markhor delights in rocky forests, and although it occasionally comes out into the open glades, it seeks concealment as much as possible." Hence its hunting calls for the greatest skill as well as endurance. This goat is often captured, tamed and crossed with domestic goats; and it is believed to have had some influence in originating the Angora breed. Consult: Lydekker, 'Wild Oxen, Sheep and Goats of All Lands' (1898).

Marking-nut, an East Indian tree (*Semecarpus Anacardium*) of the cashew family, having a fruit the receptacle of which is roasted and eaten. The black juice of the unripe fruit serves with quicklime to make an indelible marking-ink.

Markings of Animals. See COLORATION, PROTECTIVE.

Marks' Mills, Engagement at. On 23 April 1864, a train of 240 wagons, escorted by 1,200 infantry, 400 cavalry, and five guns, all under command of Lieut.-Col. F. M. Drake, 77th Ohio Infantry, left Camden, Ark., for Pine Bluff, to get supplies for Gen. Steele's army, then co-operating with Banks' Red River expedition. At 10 A.M. of the 25th, when at Marks' Mills, on the Camden and Pine Bluff road, about eight miles beyond Saline River, Drake was attacked front and rear, by Gen. Fagan's force of 3,000 men—cavalry, mounted infantry, and two batteries—and after a hard fight of more than three hours, during which Drake was severely wounded, and had lost 250 in killed and wounded, the entire train, guns, and the greater part of the cavalry and infantry were captured. About 300 escaped and made their way to Little Rock and Pine Bluff. Incomplete Confederate,

MARL — MARLBOROUGH

returns show a loss of 41 killed, 108 wounded, and 144 missing. Fagan's entire loss was about 420. When Steele heard of the disaster he immediately abandoned the idea of joining Banks, left Camden on the night of the 26th for Little Rock, was followed by Sterling Price, had a rear-guard fight at Jenkins' Ferry on the 30th, and continued his retreat to Little Rock. Consult: 'Official Records,' Vol. XXXIV.

E. A. CARMAN.

Marl, a mixture of carbonate of lime and clay in various proportions. If the lime predominate the marl is called calcareous; clay marl, or argillaceous marl, has a larger proportion of clay. As marl is hard or not it is called indurated or earthy. Even the more solid marls crumble soon on exposure to the atmosphere, and form a paste if dipped in water; they effervesce in acids, because of the presence of carbonate of lime. Marl occurs in masses and beds, is associated with chalk, gypsum, sand, clay, or compact limestone, and contains important fossil remains. To the presence of carbonate of lime in its composition, marl owes its use as a fertilizer. Hence it happens that many natural mixtures used as manures are called marls, such as the New Jersey green sand-marls, which contain as their principal constituents clay and greensand and usually only 1 or 2 per cent of carbonate of lime. The latter use of the word is scarcely justifiable, especially as it is sometimes applied, notably in England, to substances containing no lime at all.

Marlboro, mār'l'būr-ō, Mass., city, in Middlesex County; on the Boston & M. and the New York, N. H. & H. R.R.'s; about 28 miles west of Boston and 15 miles east of Worcester. Marlboro was settled in 1656 by a colony from Sudbury, Mass., and four years after was incorporated as a town. In 1890 it was chartered as a city. During King Philip's War (1676) the Indians destroyed nearly the whole town. The chief manufactures are boots and shoes, shoe-making machinery, automobiles and automobile-tires, bicycles, carriages and wagons, lamps, electrical machines and supplies, boxes, hose-pipe, wooden-ware, cigars, and machine-shop products. The principal buildings are the high school, city-hall, Saint Ann's Convent and Academy, a public library, G. A. R. building, and a number of churches and schools. The mayor is elected annually and has power to appoint, subject to approval by the council, the police and the members of the street and fire departments. He also appoints the members of the license department. The council elects the members of the health, poor, and water departments. The waterworks are owned and operated by the city. Pop. (1890) 13,805; (1900) 13,607. Consult Hudson, 'History of the Town of Marlboro, Massachusetts.'

Marlborough, mār'l'būr-ō, or māl'būr-ō, John Churchill, DUKE OF, English general and statesman: b. Ashe, Devonshire, 1650; d. Blenheim 16 June 1722. At 12 he became page to the Duke of York (afterward James II.), by whom at 16 he was appointed an ensign. He was present at the siege of Tangiers, and soon after his return rose to the rank of captain. In 1672 he accompanied the Duke of Monmouth to assist Turenne against the Dutch. At the siege of Maestricht he distinguished himself so highly as to obtain the public thanks of the king of

France. On his return to England he was made lieutenant-colonel, and his advancement was rapid. He had a regiment of dragoons presented to him, and strengthened his influence at court by his marriage with Sarah Jennings, an attendant upon the princess, afterward Queen Anne. In 1682 he obtained the title of Baron of Aymouth, and on the accession of James II. was sent ambassador to France, and soon after his return created Baron Churchill of Sandbridge, and raised to the rank of general. The same year he suppressed the rebellion of the Duke of Monmouth. On the arrival of the Prince of Orange he joined him at Axminster, and was rewarded by the earldom of Marlborough, and the appointment of commander-in-chief of the English army in the Low Countries. The following year he served in Ireland, where he reduced Cork, Kinsale, and other places. In 1691 he was suddenly dismissed from all his employments and committed to the Tower on the charge of high treason, but soon obtained his release; though it appears that the suspicions against him were not without foundation. On the death of Queen Mary he was made a privy-councillor, and appointed governor to the young Duke of Gloucester; and in 1701 was created by King William commander-in-chief of the English forces in Holland, and ambassador plenipotentiary to the States-General. On the accession of Queen Anne in 1702, he was created captain-general of all the forces at home and abroad, and sent plenipotentiary to The Hague. There he was also made captain-general by the States. In the campaign of the same year he drove the French out of Spanish Guelders, and took Liège and other towns, for which he was created Duke of Marlborough. In 1704 he stormed the French and Bavarian lines at Donauwörth, and in the same year, with Prince Eugene, gained the victory of Blenheim (13 August) over the French and Bavarians, headed by Marshal Tallard and the Elector of Bavaria. The nation testified its gratitude by voting him the manor of Woodstock and Blenheim Palace, one of the finest seats in the kingdom. In the campaign of 1707 his antagonist was the famous Duc de Vendôme, over whom he gained no advantage; and on his return he found that his popularity at court was on the decline. In 1708 with Prince Eugene, he gained the battle of Oudenarde. In 1709 he defeated Marshal Villars at Malplaquet (11 September) though at a cost ill repaid by the capture of Mons, and in 1710 with Prince Eugene gained another victory over Villars. During his absence a new ministry, hostile to himself, was chosen, and on his return his command was taken from him, and a prosecution commenced against him for applying the public money to private purposes. He went in disgust to the Low Countries in 1712, but returned a short time before the queen's death, and on the accession of George I. was reinstated in the supreme military command. Consult: Coxe, 'Memoirs of the Duke of Marlborough' (1847-8); Alison, 'Military Life of the Duke of Marlborough' (1879); Saintsbury, 'Marlborough' (1879).

Marlborough, New Zealand, the north-eastern provincial district of South Island, bounded by the sea and the provincial district of Nelson. Its extreme length is 130 miles, breadth 60 miles; area, about 3,000,000 acres.

MARLIN — MARLOWE

The coast is deeply indented by bays and natural harbors, from which the hills rise abruptly, clothed with magnificent forests. The district is generally hilly or mountainous, with splendid scenery. The amount of arable land is restricted; in the south are the Wairau Plains, one of the finest sheep tracts in New Zealand. Blenheim, the capital, is connected by rail with the seaport of Picton on Queen Charlotte Sound. Pop. (1901) 13,326.

Mar'lin, Texas, city, county-seat of Falls County; on the Houston & T. C. and the International & G. N. R.R.'s; about 150 miles northwest of Houston and 26 miles southeast of Waco. It is situated in an agricultural region in which cotton is the chief product. The industrial establishments include a large cottonseed-oil mill, several cotton gins, and a cotton compress. The trade is chiefly in cotton and live stock. Marlin has a hot-water artesian well, 3,350 feet in depth, with a temperature of 147° F. The waters possess medicinal properties which attract a large number of health seekers to the city. Some of the principal buildings are a central school building, fine hotels, sanatoriums, an opera house, and a court-house. Pop. (1890) 2,058; (1900) 3,092.

Marlin, a sportsman's name for the god-wit (q.v.).

Mar'ling Spike, or **Marline Spike**, an iron pin tapering to a point, and principally used by sailors to separate the strands of a rope in splicing or knotting. A large wooden pin used for the same purpose is called a *fid*.

Mar'litt, E. See JOHN, EUGENIE.

Marlowe, Christopher, English poet and dramatist: b. 1564; d. 1593. In 1583 he took the A.B. degree at Benet College, Cambridge, and in 1587 the degree of M.A. Perhaps in the same year, the first part of his 'Tamburlaine' was acted in London; and the rest of his life was spent in active connection with the theatres. His life seems to have been somewhat dissipated, and the daring of his theological opinions gave color to an accusation of atheism. In 1593 he was killed in a tavern broil and was buried at St. Nicholas, Deptford.

Numerous plays have been assigned to Marlowe, including a share in the three parts of 'Henry VI.'; and he may very likely have had some part in others besides the following, which can with certainty be ascribed to him: 'The Tragedy of Dido,' of uncertain date of acting, printed 1594; 'Tamburlaine' (two parts), acted 1587-8, printed 1590; 'Dr. Faustus,' acted 1588-9, printed 1594; 'The Jew of Malta,' acted about 1590, printed 1594; 'Edward II.,' acted 1591, printed 1594; 'The Massacre of Paris,' acted about 1591, printed about 1595. His 'Hero and Leander' was left incomplete at his death, and was finished by George Chapman and published in 1598. Marlowe's plays attained a sudden and great popularity, and his poetic reputation is testified to by numerous tributes from his contemporaries.

Marlowe's dramatic activity came at a time of great emotional stir and stress. In England the ideas and ideals of the Renaissance and the Reformation had finally gained the ascendancy over those of the Middle Ages. The struggle

with Spain, which was just ending in the destruction of the Armada, had brought a triumphant consciousness of national greatness. From this newly discovered England as well as from the newly discovered America and the re-discovered world of Greece and Rome, came countless incentives for multifarious activities. In literature as in life opportunity seemed boundless, experiment and innovation easy, voyages of discovery sure of rich reward. The drama had already become in some measure an expression of this national activity, but it still awaited the services of great literary genius. After two generations of precarious struggle, the professional companies had become firmly established in the public theatres and it was already plain that the main development of the drama was henceforth to be popular and professional rather than scholarly and amateur. In comedy, indeed, the plays of Lyly and Peele had already supplied refinement and a literary flavor, but in the popular drama in the main and in tragedy in particular, there was neither refinement nor poetry.

Marlowe created English tragedy anew. He threw aside Senecan traditions and devoted himself to meeting the demands of the London theatres, but the prologue to his first play was a declaration of reform, announcing the adoption of blank verse, heroic themes, and "high astounding terms." His themes were novel, and his treatment of them seems to have been dictated by a conception of tragedy, formed independently of his predecessors,—the heroic struggle of a great personality doomed to inevitable defeat. 'Tamburlaine' is hardly a tragedy at all but rather a chronicle of the hero's greatness; but in 'Dr. Faustus' and 'The Jew of Malta,' heroes with ambitions as boundless and passionate as Tamburlaine's are overwhelmed in the end by the limitations that forever bound human aspiration.

These plays mark the formation of the Marlowean type of tragedy, often imitated and long influential in the English drama. A protagonist distinguished by great passions and many crimes absorbs the interest of a series of scenes, brutal and sensational, full of violent action, ranting declamation, bloodshed, and villainy affording opportunity for elaborate theatrical spectacles, and adorned by passages of profound intellectual suggestiveness and extraordinary beauty of diction and melody. 'Edward II.,' the most mature of his plays, illustrates these characteristics and also testifies to his growing power both as a playwright and as a poet. The characterization is less melodramatic, more varied, and more human than in the earlier plays; the structure more coherent and organized; the style less bombastic, more even and more dramatic. Shakespeare, who clearly imitated Marlowe in 'Richard III.' and produced 'Richard II.' in duality of 'Edward II.,' did not in these two plays surely surpass his master.

Marlowe's faults and deficiencies are apparent, and they cannot all be credited to the immaturity and experimental nature of his art. The banalities that mar his noblest scenes, and the absurdities that appear in every phase of his work, theatrical, dramatic, or poetic, would doubtless have disappeared in the rapid development of dramatic art which the next 30 years witnessed. But there are no indications that,

had Marlowe's life been prolonged, he would ever have excelled in humor or the individualization of character. His achievement is, nevertheless, among the most remarkable and enduring of the Elizabethan era. His poetry remains forever impressive with its fine impetuosity, its splendors of diction and melody. His tragedies, of immense influence on the theatre of his day, continue to rank among the greatest of English literature in their expression of passionate ambition and aspiration. He was the first great English dramatist, and he prepared the way for Shakespeare.

Bibliography.—The best collected editions of his works are by Rev. Alexander Dyce, 1850, and 1870, and by A. H. Bullen, 1885 (3 vols.). His four tragedies are in one vol. of *Mermaid Series of Old Dramatists* with introduction by J. A. Symonds. For biography and criticism: A. W. Ward, 'History of Dramatic Literature' (vol. 1); F. G. Fleay, 'Biographical Chronicle of the Drama' (vol. 2); J. H. Ingram, 'Christopher Marlowe and His Associates'; O. Fischer, 'Zur Charakteristik der Dramen Marlowe's' (Munich). Marlowe's life has been the theme of two modern tragedies, R. H. Horne's 'The Death of Marlowe' (1870), and Miss Josephine Peabody's 'Marlowe' (1901).

ASHLEY H. THORNDIKE,

Professor of English, Columbia University.

Marlowe, Julia (MRS. TABER), American actress: b. (Sarah Frances Frost), Caldbeck, Cumberlandshire, England, 17 Aug. 1870. She came with her parents to the United States in 1875. In 1882 she joined the Juvenile Opera Company, which presented 'Pinafore,' 'The Chimes of Normandy,' and other light operas, in which she was known as Frances Brough. Subsequently she took a child's part in 'Rip Van Winkle.' She then retired, studied in New York for three years, and then made her metropolitan debut as Parthenia in 'Ingomar.' Her later rôles include Viola in 'Twelfth Night'; Rosalind in 'As You Like It'; Highland Mary in 'For Bonnie Prince Charley' (1897); Barbara Frietchie in the play of that name by Clyde Fitch (1899); and Charlotte Durand in Cable's 'Cavelier' (1902). Other plays in which she has taken the title rôles are 'Colinet' and 'When Knighthood was in Flower.' During the seasons 1905-7 she and Mr. E. H. Sothern became joint stars in Shakespearian rôles. On 28 May 1894 she was married to Robert Taber, who had been her leading man in her first appearance in 'Romeo and Juliet' in 1888. They starred together for a season, but owing to a disagreement were later separated and in 1900 Mrs. Taber secured a divorce. Consult Strang, 'Famous Actresses of the Day in America' (Boston 1899); Browne and Austin, 'Who's Who on the Stage' (New York 1906).

Mar'maduke, John Sappington, American soldier: b. Saline County, Mo., 14 March 1833; d. Jefferson City, Mo., 28 Dec. 1887. He studied at Yale and Harvard and graduated from West Point in 1857, and served in the United States army in the West. At the outbreak of the Civil War he entered the service of the Confederate States and rose to the rank of major-general. In 1864 he was captured and was not released until after the close of the war, when he went abroad for a time, and on his return engaged

in business and also in journalism. He was defeated for the governorship of Missouri in 1880, but in 1884 was elected and served until his death.

Mar'malade, a jellied or gelatinous preparation made from quinces, peaches, apricots, or oranges, and portions of their rinds, with a mixture of sugar and spice. It is made like the ordinary jams, poured out warm into pots or jars, and sold in commerce as a confection.

Marmier, Xavier, French author: b. Pontarlier, Doubs, 24 June 1809; d. Paris, 11 Oct. 1892. He engaged in journalism and later traveled extensively in Switzerland, Holland, Germany, Russia, Algeria, America, and the East. In 1835 he accompanied the scientific voyage of the *Research* to the Arctic regions and then acquired a wide knowledge of the Scandinavian and Finnish languages and customs. In 1839 he became professor of foreign literature at Rennes and in 1841 occupied a position under the Minister of Public Instruction. In 1846 he was appointed librarian at St. Geneviève in Paris and in 1870 was elected a member of the Academy. Among his publications are 'Histoire de l'Islande' (1838); 'Langue et Littérature Islandaises' (1838); 'Histoire de la littérature en Danemark et en Suède' (1839); 'Lettres sur la Russie, la Finlande et la Pologne' (1843); 'Du Rhin au Nil' (1846); 'Lettres sur l'Amérique' (1852); 'Voyage en Suisse' (1861); 'Voyages et Littérature' (1888); and the novels 'Les fiancés du Spitzberg' (1858); 'Gazida' (1860); 'Cimara' (1867); 'Les drames du cœur' (1868); 'Une grande dame russe' (1876); etc.

Marmol, Jose, hō-sā' mār-mōl', Argentine author: b. Buenos Ayres 5 Dec. 1818; d. there 12 Aug. 1871. He was a pronounced Democrat, was banished by Rosas, led the opposition against that dictator, and on its successful termination became senator and librarian of Buenos Ayres. A fervent orator Marmol is better known as the author of 'La Amalia' (1866), a historical novel dealing with Rosas' dictatorship, of the popular patriotic poem 'El 25 de Mayo de 1843,' and of various dramas.

Marmont, Auguste Frederic Louis Vieesse de, ô-gust frâ-dê-rêk, loo-ê vê-ês dê mār-môn', Duke of Ragusa and Marshal of France: b. Chatillon-sur-Seine, France, 20 July 1774; d. Venice 2 March 1852. He entered the army as a lieutenant of infantry in his 15th year. In 1792 he changed to the artillery, and at Toulon became acquainted with Bonaparte, who chose him for his aide-de-camp. In the campaign of 1813 he held the command of an army corps in Germany, and fought in the battles of Lutzen, Bautzen, and Dresden. In 1814 he fought a final battle under the walls of Paris, but opposition appearing fruitless surrendered to the allies. This proceeding was one main cause of Napoleon's immediate abdication, and brought Marmont into favor with the Bourbons. After the Restoration Louis XVIII. made him a peer of France, but he was compelled to withdraw from Paris by the revolution of 1830, and his name was struck off the army list.

Marmontel, Jean Francois, zhôn frân-swâ mār-môn-têl, French writer: b. Bort, Limou-

sin, France, 11 July 1723; d. Abbeville, Eure, 31 Dec. 1799. He was educated for the Church, but turned to letters, and became a journalist and dramatist at Paris. In 1758-9 he edited 'Le Mercure,' and in 1763 was elected to the Academy. He wrote tragedies, including 'Denys le Tyran' (1748) and 'Aristomène' (1749); 'Contes moraux' (1761); and the works of fiction, 'Béhsavie' (1767) and 'Les Incas' (1778). His 'Poétique Française' (1763) and 'Eléments de Littérature' (1787) have perhaps a more permanent worth. A collected edition of his writings appeared in 1786-7.

Marmora, mār'mō-ṛa, or **Marmara**, **Sea of** (anciently *Propontis*), an inland sea, lying between southeastern Europe and the westernmost part of Asia, communicating with the Mediterranean by the narrow strait called the Dardanelles, and with the Black Sea by the Bosphorus. Length from Gallipoli to the head of the Gulf of Izmid, 177 miles; greatest breadth, which is near the centre, rather more than 50 miles; average depth, over 600 feet; maximum depth, 4,000 feet. The gulfs of Izmid and Moudania, on the Asiatic side, are the chief indentations. The largest of several islands is Marmora, famous for its quarries of marble and alabaster, situated near its western end; at the eastern end, on the Asiatic coast, and not far from Constantinople, is a group called the Princes Islands. A current sets from the Black Sea into the Sea of Marmora, which in turn runs into the Archipelago. The tides are hardly perceptible, and the navigation is easy.

Mar'moset, a small American monkey of the family *Hapalidae*. They inhabit the Brazilian forests, possess long, non-prehensile tails, have a thick wooly fur, and bear a close resemblance to squirrels in appearance and movements, having long hind legs and penciled ears. They are notable, further, for the relatively large size of the brain and the few teeth (32), likening the family more to the monkeys of the Old World than to those of the other American family (*Cebidae*). They are favorite pets, not only on account of their quaint prettiness, but because of their gentleness and intelligence; but they are exceedingly delicate and rarely survive a change of climate. Their food is varied.

The family includes many species which fall into two divisions—the genus *Hapale* and the genus *Midas*. The former contains the typical marmosets, or ouistitis, as the French call them, of which one species (*H. jacchus*) has long been a familiar pet; and the latter, the silky marmosets or tamarins, which are larger and more varied in their colors and in their ornamental tufts and crests. The best known species is the marikina (*M. rosalia*).

Mar'mot, a large ground-squirrel of the genus *Arctomys*, having terrestrial habits, rather coarse fur, no cheek-pouches, short limbs, and powerful digging claws. In size they vary from about 15 to 25 inches in length, the tail adding from 3 to 12 inches. Several species inhabit the northern parts of the world, in southerly climates, keeping themselves mostly upon mountain heights, but farther north inhabiting lower levels, preferring open or thinly wooded plains. All dig and dwell in burrows, some species gathering into extensive colonies, the hillocks about

the mouths of the burrows forming communities similar to the "towns" of the prairie-dogs; while other species dwell in families far apart from one another. They feed upon herbage and grow very fat in the autumn preparatory to hibernation during the cold months, when their dormancy is complete. Their underground sleeping-chambers are warmly furnished with dry leaves and hay.

The European marmot (*A. Alpinus*) is found in plenty on the Alpine range, equals a rabbit in size, and is light brown in color. It lives immediately below the snow line, and subsists on vegetables, insects, and roots. They come forth from their burrows during the month of April, and are said to be readily tamed. The bobac, another European species (*A. bobac*), inhabits Poland, Russia and all northern Asia. A third species is found in the Himalayan ranges; and a fourth (*A. caudatus*), the largest and handsomest of the family, dwells in the valleys of their southerly slopes. These little animals are of great value to the wandering natives of northern and central Asia, who utilize both their skins and flesh. America has two marmots, one of which is the siffleur or whistler of the tops of the northern Rocky Mountains, and the other the familiar eastern woodchuck. The former takes its name from the loud eerie whistle with which it wakes the echoes of the crags about the lone pastures above timber-line, where it makes its home; it was of great service to the mountain Indians. Other species or varieties occur in the southern mountains of the Western States.

The woodchuck, or ground-hog (*A. monax*), is a heavy, broad-headed, grizzled animal of the woods and fields, yellowish to whitish gray in color, blackish on the back and crown, and chestnut on the belly; with the feet and tail brownish black. It abounds throughout the whole country east of the dry plains, and flourishes in spite of civilization, as the farmers' meadows and gardens supply it with an increased supply of good food, and mankind thins out its worst enemies, such as wildcats, foxes, weasels, the larger serpents and birds of prey; none of these save the first is much to be feared by the full-grown woodchucks, but may kill many of the young. As a result the animals have become unpleasantly numerous in some districts of the Eastern States, where their depredations upon gardens and certain plantations, as of lettuce and celery, are often serious. Consult: Lydekker, 'Royal Natural History,' Vol. III. (1895); Stone and Cram, 'American Animals' (1902).

Marne, mār'n, France, a river, the chief affluent of the Seine, rising in the plateau of Langres, flowing northwest past Châlons to Epervay, thence westward, joining the Seine at Charenton, four miles above Paris. Its length is 326 miles, 126 of which are navigable to Saint Dizier. It is connected by canals with the Rhine, the Aisne, and the Seine.

Marocco, mā-rōk'ō. See MOROCCO.

Maronites, mār'ō-nīts, a sect of eastern Christians, whose origin was a consequence of the Monothelite controversy. In the 7th century the opinion that Christ, though he united in himself the divine and human natures, had but one will arose among the eastern nations. But when their last patron, the Emperor Philipippus Bardanes, was deposed and exiled in 713, the

MAROONS — MARQUESAS

Monothelites were condemned and banished by his successor, Anastasius. The remnant of this party survived in the Maronites (so named from their founder Maron) — a society of monks in Syria, about Mount Lebanon, which is mentioned as early as the 6th century. Another monk, John Maro, or Marum, also preached Monothelitism there in the 7th century. Regarded as rebels by the Melchites (q.v.), or Christians who adhered to the opinions of the emperor, they became, in the country of Lebanon, which is now called Kesrawan, a warlike mountain people, who defended their political as well as their religious independence boldly against the Mohammedans, and who even now, under the Turkish government, resist the payment of a tribute, like the Druses. The political constitution of the Maronites is that of a military commonwealth. Governed by their ancient customary rights, defended from external attacks, they support themselves among the mountains by husbandry and the produce of their vineyards and mulberry-trees. The revenues of all their orders of ecclesiastics are very small, but a common spirit unites them, and in simplicity of manners, temperance, and hospitality, they resemble the ancient Arabians. Revenge for murder is permitted among them, and as a sign of nobility they wear the green turban. Their church constitution resembles very much that of the old Greek Church. Since the 12th century they have several times submitted to the Pope, and joined the Roman Catholic Church, without giving up their own peculiarities. At last Clement XII. induced them to accept the decrees of the Council of Trent at a synod held in 1736 at their convent of Marhaana. After this synod their priests still retained the right to marry, after the manner of the Greek Church; and they continued to administer the sacrament under both forms. The use of the Arabic language was preserved in the church service. Mass was read only in the ancient Syriac. Their head is called the Patriarch of Antioch, although his residence is in the monastery of Kanobin, upon Mount Lebanon; and he gives an account every 10 years to the Pope of the condition of the Maronite Church. Under him are the bishops and other clergymen, who form seven degrees of rank. In Kesrawan are over 200 Maronite convents and nunneries, containing in all from 20,000 to 25,000 members who profess the rule of St. Anthony, and devote themselves to agriculture and gardening. Since 1584 there has been a Maronite college established at Rome for the education and training of their clergy. At present the Maronites are supposed to number about 350,000, and these are distributed into 150 parishes. In consequence of the sanguinary conflicts between the Maronites and Druses, June 1860, both communities are now subject to one governor appointed by the Porte, with the title of governor of the Lebanon. See DRUSES.

Maroons', the name given to runaway negro slaves in Jamaica and in some parts of South America. The name seems to be equivalent to mountaineers, being derived from Spanish, *cimarron*, a fugitive negro or maroon, from *cima* (same as French *cime*), a summit or hill-top. In many cases runaway negroes, taking to the forests and mountains, rendered themselves formidable to the colonists, and sustained a long and brave resistance against the whites. When

Jamaica was conquered by the English in 1655 about 1,500 slaves retreated to the mountains. They continued to harass the island till 1795, when they were finally reduced by the aid of bloodhounds. Some of them were removed to Nova Scotia, and afterward to Sierra Leone. Consult: Dallas, 'History of the Maroons.'

Maroquin, mār-ō-kēn'. See MOROCCO (leather).

Marozia, mā-rō'zī-ā, Roman lady of infamous reputation, known for her influence at the Papal court; d. Rome 938 A.D. She was the daughter of Theodora (q.v.). According to Luitprand she was the mistress of Pope Sergius, but this is now denied as lacking historical foundation. As mother of John XI., and grandmother of John XII. and Leo VII., she exercised great influence on the political affairs of her time in Italy. She repented and died in a convent.

Marquand, mār-kānd', **Henry** **Gurdon**, American banker and philanthropist; b. New York city 11 April 1819; d. 26 Feb. 1902. He was educated in Pittsfield, Mass., and for 20 years was in the real estate business, afterward becoming a banker and acquiring an interest in various railways and other commercial enterprises. He was a generous patron of the Metropolitan Museum of Art, to which he gave valuable paintings, etc., and among his other benefactions are a pavilion to Bellevue Hospital and a gymnasium and a chapel to Princeton University.

Marque, mārĕ, **Letter of**, a commission granted to the commander of a merchant ship or privateer to cruise against and make prizes of the enemy's ships and vessels, either at sea or in their harbors, under pretense of making reprisals for injuries received. The ship so commissioned is also called a letter of marque or mart. These letters are grantable by the law of nations, but the sovereign power must be called in to determine when reprisals may be made.

Marquesas, mār-kā'sās, or **Mendaña** (mēn-dā'ña), **Islands**, or **Les Marquises**, Polynesia, an island group in the South Pacific Ocean, lat. 8° to 11° S.; lon. 138° 30' to 143° W. belonging to France since 1842, and composed of 12 islands and islets divided into two groups, the northern and southern. The largest islands are Nukahiva and Hiva-ōa. The coasts are generally inaccessible, rising from the water like walls; but in Nukahiva there are some excellent natural harbors. The islands are generally high, some of their mountains reaching an elevation of over 4,000 feet; the intervening valleys are fertile, picturesque, and copiously watered by streams which form numerous cascades. The principal food productions are pulse, yams, coconuts, sugar-cane, cotton, and bamboos; hogs also are numerous. The men are well-formed, active, powerful, and all tattooed. The women have regular features, good complexions, fine teeth, and neat hands, and are the finest of the sex to be met with in Polynesia. The people of these islands were formerly cannibals, and though this practice has been discontinued cruelty and ferocity are prevailing characteristics, and the efforts of the missionaries have met with but little success. The Marquesas were discovered in 1595 by Alonzo Mendaña de Neyva. They were subsequently visited and described by Cook and

MARQUETRY—MARQUETTE

the Forsters in 1774, when Hood's Island was added to the group. In 1797 three more were discovered by Ingraham, an American captain, and were named Washington Islands. In 1842 they acknowledged the sovereignty of France. The population steadily decreased during the 19th century, in 1876 being 5,420, in 1900, 4,300.

Marquetry, mār'ket-rī (French, *marqueterie*), inlaid cabinet-work in which thin slices of different colored wood, sometimes of ivory, pearl, shell, or metal, are inlaid on a ground usually of oak or fir, well seasoned to prevent warping. The marquetry of Italy possesses much artistic merit. See INLAYING; MOSAIC.

Marquette, Jacques, French Jesuit missionary and explorer: b. Laon, France, 1 June 1637; d. near site of the present Ludington, Mich., 18 May 1675. His recent biographers, M. Alfred Hamy, in 'The Mississippi,' and the Rev. Samuel Hedges, in his book on the burial place of Marquette, tell us that his family was of good social position in his native city. It is evident that he must have had the advantages of early education, as he entered the Jesuit College at Nancy, in 1654, with the intention of joining the Society. He studied and taught, as Jesuit scholastics usually do, at Pont-à-Mousson, Rheims, Charleville, and Langres. In 1666 he was to go as a missionary priest to New France. He arrived at Quebec, 20 Sept. 1666. In the next month, he began his preparation for life among the savages by the study of the Indian languages, at Three Rivers, under the direction of Father Druillettes, who knew all the ways of missionary life. He spent two years in the wilderness, with Father Druillettes's log house as his "home," learning the forest and lake and living, as near as possible, the life of the Redmen. In 1668, Father Marquette was ready to begin work among the Ottawas. From Montreal, he went to Sault Ste. Marie, known to-day as the "Soo," then marked in French records "Sanda Maria" of the Algonquins. The term "Ottawa," as used by the Jesuits, included the Sioux, the Miamis, the Sacs, the Winnebagoes, Foxes, Pottawatomes, Chippewas, Beavers, Creeks, Ottawas, Hurons, Menominees, Illinois, and Hurons. From Sault Ste. Marie, he was sent to La Pointe Mission in Lake Superior. The place selected for his work was at Chequamegon Bay. From 14 Sept. 1669, until 1671, when the mission was given up because of the inability of the Hurons to defend themselves against the Sioux, he served and learned much. Father Marquette probably did not foresee that this abandonment meant that there would be no Christian mission on Lake Superior "for over a hundred years"; as the Rev. Samuel Hedges remarks, "There can be little doubt that the Blackrobe sat in their council circle, and took part in their deliberations, which determined their flight." He says Marquette joined the Hurons in their rush to the South toward the Island of Mackinac, then Machillimackinac. The little town of St. Ignace, named in honor of the founder of the Jesuits, St. Ignatius Loyola, on Moran Bay,—claims the honor of being the spot where Father Marquette built his chapel in 1671. Mackinac Island disputes with St. Ignace the right of precedence, but there can be no doubt, whether a previous mission existed in Mackinac Island or not, that it

was from St. Ignace Father Marquette set out in his search for the Mississippi,—of the existence of which traditions and rumors lived among the tribes.

The quarrels that had deflected the course of Sieur René de la Salle did not, in the end, prevent him from tracing the course of the Mississippi to the sea, and De Soto, earlier, had crossed the valley near its mouth, but it was Marquette who, having equipped himself with the Indian lore added to such scientific knowledge as he could acquire, actually discovered the wonderful stream of the Indian legends. Count Frontenac was the devoted friend of La Salle, but he could not overcome the jealousies raised by the clashing of commercial interests. It has been the fashion to accuse the Jesuits of merely mercenary motives in opposing the opening of the territory of their missions in New France to all trappers and traders. It is plain, human,—putting aside all imputed motives,—that Jesuits like Jogues, Albourg, Druillettes, and a hundred others did not lead lives of unspeakable deprivations and amazing self-sacrifice merely for temporal gain for their Society or their country. When it is known that they were French, it is at once known that they were patriots. And if the Jesuits opposed the mercantile designs of the supporter of La Salle, it must be admitted in the light of after events, that they were safeguarding the interests of their charges. The fate of Jogues and of René Goupil did not deter men like Marquette. It only made them more anxious to teach Christianity or to die. Marquette, like all the missionary priests of his Society, held that it was his duty to contribute to the knowledge of the world. Whether it was the analysis of a dialect or the bending of a river, the Jesuit made each his duty, always remembering the motto of his Society, "To the greater glory of God." Marquette had kept in mind all the talk about the great river and the natives that dwelt upon its banks. He was sent, he believed, as one who must teach all nations, and he did not disdain any knowledge that might help him to this, valuing the knowledge itself, for every Jesuit was a student both of nature and of books. "In fishing and boating about the straits," the Rev. Samuel Hedges writes, "the writer has often been puzzled by what he took for currents from Lake Michigan, as it empties into Lake Huron. But observation and experience showed him that the currents, as he thought them, as often tended toward Lake Michigan as from it. Marquette had noticed this long ago, and in one of his reports to his superiors offers an explanation. Louis Joliet had started to become a Jesuit, but had, instead, become a fur trader. When he was commissioned by the Governor of New France, to look for the great stream that, it was rumored, opened into the Pacific, Father Marquette, who earnestly desired it, was sent by his superiors to accompany him. On 8 Dec. 1672 Joliet reached St. Ignace under his own authorization from De Frontenac and one from Father Marquette's provincial, to claim for God and the king all the land and water they could find.

When the ice broke, on 17 May 1673, Marquette and Joliet set forth. Father Pierson took Father Marquette's place at the mission. Father

MARQUETTE

Marquette was something of a surveyor, and his maps are yet in evidence and very valuable. Two birch canoes that could only hug the shore and not dare the open lakes, and seven men,—five *voyageurs*—made up the expedition. Their stores were barely sufficient, their scientific instruments were, as one can easily imagine, inadequate. They were hopeful, hardy, and they knew every mood of the treacherous lakes and the meanings of all the changes in the weather. Marquette had acquired the quick eye and ear of the Indian, and his mind was supple and well-trained; Joliet was not far behind him in wood and water craft. Still, they followed dim rumors. The most interesting of Marquette's reports is that of the second halt at the Indian village of Mascouten, on Lake Winnebago. They had reached the "jumping off" place. Their first halt was at De Pere, the Mission St. Francis Xavier, to which Father Marquette had been recently assigned. They reached Lake Winnebago by way of the Fox River. From Green Bay,—the Mission St. Francis,—they went to Lake Winnebago, and, from thence, accompanied by the Indian guides, they ascended the upper Fox River and entered the Wisconsin, on 10 June 1673. After seven days of hard paddling, they entered the Mississippi on 17 June. The report of this expedition on which we must rely for information is Marquette's,—Joliet's having been lost in the upsetting of his canoe at the La Chine Rapids, near Montreal. It is included in the 'Jesuit Relations,' and quoted by John Gilmary Shea, Sparks, Parkman, Thwaites, Hedges, and all who have written of the early days of the Northwest. Dr. Shea, in his 'Discovery and Exploration of the Mississippi Valley,' estimates the distance traveled by Marquette and Joliet from St. Ignace to Green Bay (Mission St. Francis Xavier), at 218 miles. General Wood, Inspector-General United States Army, makes the whole distance traveled 2,549 miles, but he omits the distance from St. Ignace to Green Bay. Marquette and Joliet explored the Mississippi for 300 miles in solitude. Marquette describes the river at its junction with the Missouri as turbulent in the extreme. Marquette was pleased by the treatment received at the first village of Illinois Indians. They met Indians who showed traces of civilization; they were tormented with mosquitoes and they saw traces of iron. At the mouth of the Arkansas, they met with great kindness from the Indians. From the Illinois,—believing the route to be shorter,—they went, it is asserted, to a point near Chicago. By portage, at Sturgeon Bay, they saved time and strength, and from the Green Bay into the Fox River, they reached the Mission St. Francis,—having spent, from the beginning of their ascent of the newly discovered river, on 17 July, about two months,—four months, in all, of almost incessant hardship since they began their voyage on 17 May 1673. Further journeying was out of the question. Marquette and Joliet had not much strength left. A journey of nearly 3,000 miles, in birch canoes, had told on them, hardy as they were. Marquette spent 13 months at De Pere, endeavoring to regain his health. He knew well the stupendous importance of what he had done for France and for the world; but his business was with souls. While Joliet went to Montreal to report, Marquette started

to found a new mission in Illinois. He left the Mission St. Francis on 25 Oct. 1674, with 10 canoes; he arrived at the Chicago River 4 December. The description of the carrying of the canoes through the forests gives a glimpse of the difficulties the missionary expected to encounter. The inundations of 30 March 1675 destroyed their hovel. At Haskasian Marquette's heart was filled with gratitude by the kindness he received. His desire for exploration led him, while using his strength in ministering to the Indians, to explore Lake Michigan farther. He grew weaker, and turned to the North. Through the river,—now Pere Marquette,—he made his homeward way. On Saturday, 18 May 1675, he died. The Ottawas,—under that name were included the tribes under the Jesuits in the Lake regions,—had among them several Hiskakons, to whom Marquette had been much devoted. These, going northward in the spring, raised his body, reverently prepared it according to the mode of their tribe, took it to the Mission St. Ignace, where Fathers Nource and Piersin awaited it. On Tuesday, 9 June 1676, Marquette was buried in the centre of the chapel of St. Ignace, a building which was destroyed by fire in 1706. In September 1877, Father Edward Jacker, pastor of St. Ignace, discovered the grave and remains of the great and good explorer, and they rest under a monument erected by the citizens of St. Ignace in 1882.

MAURICE F. EGAN,
Catholic University of America.

Marquette, mār-kët', Mich., city, county-seat of Marquette County; on Lake Superior, and on the Duluth, S. S. & A., and the Lake Superior & I. R.R.'s; about 58 miles north by west of Escanaba, on Lake Michigan. The first permanent settlement was made in 1899 after public accounts had been given of the mineral wealth of the Upper Peninsula. It was incorporated in 1851 and chartered as a city in 1869. It was named after Père Marquette (q.v.) who had visited this section as a missionary to the Indians. It has a fine harbor with a break-water 3,000 feet in length, and the best of facilities for loading steamers with the minerals, especially iron ore, which are shipped from here in large quantities. The ore docks are the largest and best fitted of any in the country. It has steamer communication with all the important lake ports. Near the city are large quarries of brownstone which furnish employment to a number of people. The chief industrial establishments are a planing-mill, two blast furnaces, steam-engine works, and the stone quarries, all employing about 800 men. Other smaller industries are the manufacturing of furniture, sash, door, and blinds, and bricks. The principal buildings are a government building which cost \$150,000, a county court-house, cost \$250,000; Peter White Library, the building cost \$75,000, and the 15,000 volumes are valued at \$30,000; a city hall, cost \$60,000. The educational buildings are a State Normal School, which cost \$150,000, eight public schools, cost \$500,000, a manual training school, and Saint Joseph's Academy. It has Protestant Episcopal and Roman Catholic cathedrals, Saint Mary's Hospital, the Upper Peninsula State Prison, and a House of Correction. The Federal Government presented to the city Presque Isle, about 400 acres, a short distance north of the city

MARQUEZ — MARRIAGE AND DIVORCE

proper. The place has been improved and made into a beautiful park. A statue of Père Marquette is in a city square, near the shore. The three banks have a combined capital of \$400,000, and the annual business amounts to \$7,500,000. The government is vested in a mayor and a council of 16 members who are elected annually. The electric-light plant and waterworks are owned and operated by the city. Pop. (1890) 9,093; (1900) 10,058.

FRANK J. RUSSELL,
Editor 'Mining Journal.'

Marquez, José Arnaldo, *hō-sā' ār-nāl'dō* mār-kāth, Peruvian poet: b. Peru about 1825; d. Lima 15 Jan. 1881. For participation in civil wars he was several times banished in the earlier part of his career and he lived variously in Chile, Cuba, and the United States. Among modern Peruvian poets Marquez takes high rank. He published: 'Lost Notes' (1862); 'Flor de Abel,' etc., and in prose 'El Peru y la Espana moderna'; and 'Recuerdos de un viaje á los Estados Unidos de America.' He lost his life in the defense of Lima against the Chileans.

Marquez, Leonardo, Mexican soldier: b. Mexico about 1820. In 1849 he appeared as the leader of a movement in support of Santa Anna, and under Santa Anna's last administration he had important posts in the army (1853-5). He fought against Juarez in the "Reform" war, and favored the establishment of Maximilian's empire. In October 1866 Maximilian made him a division commander, and in March 1867 sent him to Mexico City to form a cabinet and raise troops for the relief of Querétaro. But he was hemmed in by Diaz, and after Maximilian's execution, resigned and went to Havana. He was frequently called "the tiger of Tacubaya," from his execution there of a large number of prisoners (11 April 1859); though he alleged the express order of Miramon as an explanation. He was exempted from the amnesty of 1870.

Marquis, mār'kwis, or Marquess (Italian, *marchese*; French, *marquis*; German, *markgraf*), a title of honor next in dignity to that of duke. Marquises were not known in England till King Richard II., in the year 1385, created his great favorite Robert Vere, the earl of Oxford, Marquis of Dublin. In 1397 the same king raised John de Beaufort, earl of Somerset, to the rank of marquis, a dignity which he afterward refused to bear from its being an innovation. The title fell into disuse until the reign of Edward VI., who created the Marquisate of Winchester in 1551. The title given a marquis in the style of the heralds is *most noble and potent prince*.

Marrakesh. See MOROCCO.

Marriage, a solemn contract between a man and woman, by which they are united for life, and assume the legal relation of husband and wife. It has existed in all ages and probably in all nations, though with very different degrees of strictness. It is not the invention of legislators, but arose from the instincts and necessities of society, and its continuance has been provided for by the dictates of experience. Different localities have different forms of the institution, the most broadly marked of which are connected with the right to have only one wife — *monogamy*; or a plurality of wives — *poly-*

amy. The latter, in addition to its implying permission to have more wives than one — *polygamy*, is held to include the permission for a woman to have several husbands — *polyandry*, a state of society which, however repugnant to our notions, is known to have existed in ancient times, and still exists in various localities, as in Tibet. Among the most civilized communities monogamy is the prevailing practice, possessing among other advantages a simplicity in defining the obligations of parents to their progeny not easily attainable where polygamy is allowed. There are three modes of acquiring property — capture, gift, or sale; and as in the earliest times a man's daughters were regarded as his property, he parted with them only on recognized commercial principles. Hence in ancient law the marriage relation is founded on the contract of sale, and the wife came into the possession of her husband, like other chattels, when delivery had been made after payment of the stipulated price. Therefore the conducting of the bride to her husband's house was an important and generally an imposing ceremony. The parties themselves were seldom consulted in cases of marriage, the arrangements being instituted and completed, and the contract carried out, by the heads of the families. In the progress of civilization, however, the children were allowed greater freedom of action, and effect was given to individual likings by permitting a choice. The common law now treats marriage as a civil contract, and holds it to be valid only where it is entered into by persons able and willing to contract according to established solemnities. It is essential that each of the parties must have exercised free-will, for it is the consent which constitutes the marriage. Though the Roman Catholic Church ranks it among the sacraments, and religious observances are almost everywhere customary on its celebration, the law regards it as nothing more than a civil contract. For a detailed survey of modern matrimonial methods see MARRIAGE AND DIVORCE IN THE UNITED STATES.

Marriage and Divorce in the United States. I. MARRIAGE.—The foundation of the marriage laws of the United States was laid long before the Revolution. Important features have been pruned away and others have been changed or added; but in outline the existing forms of celebration, the modes of registration, and the essential elements of matrimonial jurisprudence had already arisen. After the Reformation it was inevitable that the state should sometime take control of the marriage institution. This was first realized by the Puritans in the Netherlands. On 1 April 1580, after the independence from Spain had been declared, the provinces of Holland and East Friesland established a civil marriage form, permissively even for the members of the Reformed Church, and in principle this law was adopted by the States-General for the United Provinces in 1656. Already in England Milton was arguing that ministers should not "meddle" with marriages; and in 1653 the great civil marriage ordinance of Cromwell was passed. By this act obligatory celebration before a justice of the peace was instituted; and a careful system of lay notice, certificate, and record was established. Furthermore the same ideas actuating their brethren in England and Holland were bearing fruit among the Puritans and Independents in America.

MARRIAGE AND DIVORCE

From the beginning, in all the New England colonies, obligatory civil marriage was either practised or authorized by law. Considering the times an excellent system of notice, license, and registration was speedily developed. Save for the brief period of the Commonwealth, the mother country had nothing to compare with it until the civil marriage laws of 1836 appeared. For many years celebration before a clergyman as such was illegal. The first marriages solemnized by religious rites took place in the Andros period. But later throughout New England the religious ceremony was sanctioned; and long before the close of the provincial era the present dual system of lay or religious celebration, at the option of the contracting parties, was in full use. In the middle colonies also the optional plan existed; but the matrimonial laws of the South were enacted mainly under the influence of the Established Church. In Maryland, however, until 1777 either the religious or the lay celebration was permitted; except that after 1717 members of the Established Church were required to conform to the English ritual. Under restrictions in favor of the church civil marriage was likewise permitted in the Carolinas; and by custom the optional system seems also to have existed in Georgia, where before the Revolution there was no legislation on the subject. In Virginia the religious ceremony according to the forms of the English Church was prescribed. Not until 1780 were dissenters there allowed to celebrate wedlock according to their own rites; while three years later was taken the first step toward civil marriage. But in Virginia as well as in the Carolinas the dissenters often took the law into their own hands, marrying in accordance with their own religious customs, or resorting to the civil magistrate. At the Revolution, therefore, it seemed clear that the American type of matrimonial law and administration, as first developed in the New England colonies, must eventually triumph throughout the land. Yet, if after a century and a quarter of legislation, the fifty-three codes of matrimonial law now existing in the States—using "States" in this article to include the continental and insular districts and territories—reveal in their broader features an approximation to a common system; in their details they disclose almost infinite diversity and conflict, often attended by a want of clearness and precision.

State Laws.—Everywhere in effect, though not always expressly, matrimony is treated as a relation partaking of the nature of both contract and status. Many of the States have enacted formal definitions. In Indiana, Oregon, and Washington marriage is defined briefly as a civil contract; in Arkansas, Colorado, Indian Territory, Iowa, Kansas, Missouri, Nebraska, New Mexico, Oklahoma, and Wyoming, as a civil contract to which the consent of parties capable in law of contracting is essential; in Michigan, Minnesota, Nevada, New York, and Wisconsin it is such a contract "so far as its validity in law is concerned"; while in Alaska it is a civil contract which may be entered into by males of 21 and females of 18 years, otherwise capable. The code of Porto Rico declares that "marriage is a civil institution, originating in a civil contract whereby a man and a woman mutually agree to become husband and wife

and to discharge toward each other the duties imposed by law. It is valid only when contracted and solemnized in accordance with provisions of law." Several commonwealths have sanctioned a definition which seems to imply the element of status in the marital relation. Thus by the laws of California, Idaho, Montana, North Dakota, and South Dakota, marriage is a personal relation, arising out of a civil contract to which the consent of parties capable of making it necessary. In North Dakota, although marriage is a personal relation so arising, it must be "entered into, maintained, annulled, or dissolved" only as provided by law; in California, since the reform of 1895, consent must be followed by a solemnization authorized by the code; and in South Dakota the consent to a marriage "must be to one commencing instantly, and not to an agreement to marry afterwards." The law of Ohio is similar; and in Idaho and California neither party to a nuptial contract is "bound by a promise made in ignorance of the other's want of personal chastity, and either is released therefrom by unchaste conduct" of the other, unless both participated therein. The law of Louisiana "considers marriage in no other view than as a civil contract. . . . Such marriages only are recognized by law as are contracted and solemnized according to the rules which it prescribes." Since they are thus considered by the law merely as civil contracts, "it sanctions all those marriages where the parties, at the time of making them, were (1) willing to contract; (2) able to contract; (3) did contract pursuant to the forms and solemnities prescribed." In Georgia, "to constitute a valid marriage . . . there must be (1) parties able to contract; (2) an actual contract; (3) consummation according to law." To constitute an actual contract "the parties must be consenting thereto voluntarily, and without any fraud practised upon either. Drunkenness at the time of marriage, brought about by art or contrivance to induce consent," is held to be a fraud.

The Age of Consent.—The statutes of most of the States prescribe the minimum age of consent to marriage—not to be confused with the "age of consent" to carnal union under the criminal laws enacted to protect a child from legally agreeing to her own ruin; and where the statute is silent the common law age of 12 years for females and 14 for males is probably in force. For males the age is 21 in Alaska and Washington; 18 in Arizona, California, Delaware, Idaho, Indiana, Michigan, Minnesota, Montana, Nebraska, Nevada, New Mexico, New York, Ohio, Oklahoma, Oregon, Porto Rico, South Dakota, West Virginia, Wisconsin, and Wyoming; 17 in Alabama, Arkansas, Georgia, Illinois, and Indian Territory; 16 in District of Columbia, Iowa, North Carolina, North Dakota, Texas, and Utah; 15 in Kansas; and only 14 in Kentucky, Louisiana, and Virginia. For females the age is 18 in Alaska, Idaho, New York, and Washington; 16 in Arizona, Delaware, Indiana, Michigan, Montana, Nebraska, Nevada, Ohio, Porto Rico, West Virginia, and Wyoming; 15 in California, Minnesota, New Mexico, Oklahoma, Oregon, South Dakota, and Wisconsin; 14 in Alabama, Arkansas, District of Columbia, Georgia, Illinois, Indian Territory, Iowa, North Carolina,

MARRIAGE AND DIVORCE

Texas, and Utah; 13 in New Hampshire and North Dakota; and only 12 in Kansas, Kentucky, Louisiana, and Virginia. But the Porto Rico code provides that a marriage under the age of consent "shall, nevertheless, be valid *ipso facto* and without an express declaration, if one day after having arrived at the legal age of puberty the parties shall have lived together without the representatives of either of them having brought suit against its validity, or if the woman shall have conceived before the legal age of puberty or before having established such suit."

The age below which the consent of parent or guardian is required for the marriage of a minor is prescribed in the majority of the States. Such consent must precede the granting of license; or, where the license system has not been adopted, it must be made known by certificate or otherwise to the person or society conducting the celebration before the ceremony may be performed. For males the age is 21 years in Alabama, Arizona, Arkansas, California, Colorado, Connecticut, Delaware, District of Columbia, Florida, Illinois, Indiana, Indian Territory, Iowa, Kentucky, Louisiana, Maryland, Massachusetts, Maine, Minnesota, Mississippi, Missouri, Montana, Nebraska, Nevada, New Jersey, New Mexico, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, Porto Rico, Rhode Island, South Dakota, Texas, Utah, Vermont, Virginia, Washington, West Virginia, Wisconsin, and Wyoming; 18 in Idaho and North Carolina; and 16 in Tennessee (1899). For females the age is 21 years in Connecticut, Florida, Kentucky, Louisiana, Pennsylvania, Porto Rico, Rhode Island, Virginia, West Virginia, and Wyoming; 18 in Alabama, Arkansas, California, Colorado, Delaware, Illinois, Indiana, Indian Territory, Iowa, Massachusetts, Maine, Minnesota, Mississippi, Missouri, Montana, Nebraska, Nevada, New Jersey, New Mexico, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, South Dakota, Texas, Utah, Vermont, Washington, and Wisconsin; and only 16 in Arizona, District of Columbia, Idaho, Maryland, and Tennessee. The age for females is 18 in Georgia; but by the statutes of that State parental consent does not seem to be required for male minors, nor for females when publication is by banns. In effect the same appears to be the case in South Carolina, since a penalty is affixed for marrying a female under 16 without parental consent; while for male minors such consent is not prescribed. In some cases the statute contains important special provisions regarding the marriage of minors which modify the general rule as to age and parental consent. Thus in Maine and Massachusetts consent is only required when the minor has a parent or guardian living in the commonwealth. The Rhode Island law expressly provides that a license may be issued to a person of over 18 years when such person has no parent or guardian residing in the State; and the same is true in Connecticut of a female under age when a selectman of the town where she has last resided six months gives his consent. In Alabama, Florida, Maryland, Virginia, West Virginia, and the District of Columbia, as in some other States, it is expressly provided that parental consent is not required if the minor has been previously mar-

ried. By a law of Kentucky, if a female under 16 marry without legal consent, a court in her county having general equity jurisdiction may commit her estate to a receiver, who under direction of the court, may pay out the profits, after due compensation, to her separate use during infancy. At the age of 21, the estate is to be delivered to her, unless the court think fit to continue it longer in the receiver's hands. Under similar conditions in West Virginia the county court is empowered, "upon petition of her next friend," to commit the estate of a girl between 12 and 14 years of age to a receiver, who is to give bond for the faithful performance of his trust.

Licenses.—With few exceptions, the simple license system now prevails throughout the country. Only in Delaware, Georgia, Ohio, and Maryland does the ancient optional plan of either oral ecclesiastical banns or civil license survive. Neither banns nor license is required in New York. Instead, the person conducting the celebration is authorized to identify the parties by examining them or any other persons under oath. New Jersey has a similar plan, except that since 1897 non-residents are required to obtain a license from the county clerk five days before the wedding. All the other States, except Alaska, New Mexico, and South Carolina, where there is no statute on the subject, have each a law for civil license, the same in its purpose, but varying widely in the forms and procedure prescribed. Thus in Minnesota, to take a typical example, "previous to persons being joined in marriage, a license shall be obtained from the clerk of the district court of the county in which the female resides," or, if she be not a resident of the State, then from the same officer "in the county where the marriage is to take place in the State." The clerk may inquire of the parties under oath as to the legality of the proposed marriage. If he "shall be satisfied that there is no legal impediment thereto," he shall grant a license and make a record thereof. Persons under age and not having had a former husband or wife must have the consent of the parents or guardians personally given or certified under their hands and seals, "attested by two witnesses, one of whom shall appear before said clerk, and make oath or affirmation that he saw said parent or guardian subscribe, or heard him or her acknowledge the same." If a "clerk shall in any other manner issue or sign any marriage license, he shall forfeit and pay a sum not exceeding \$1,000," to the parties aggrieved. In this State the statute allows the clerk a fee of two dollars for each license issued. Similar powers and functions are exercised by the clerk of the district court in Iowa, Louisiana, and Montana; county clerk in California, Colorado, Illinois, Kentucky, Michigan, Nevada, Oregon, Utah, Wisconsin, and Wyoming; clerk of the circuit court in Indiana, Iowa, Mississippi, Maryland, South Dakota, and Texas; probate judge in Alabama, Kansas, and Ohio; county judge in Florida, Nebraska, and North Dakota; clerk of the probate court in Arizona; clerk of the Supreme Court in the District of Columbia; clerk of the county court in Arkansas, Tennessee, and West Virginia; clerk of the court of chancery in Virginia; county register or recorder of deeds in North Carolina and Missouri; county re-

MARRIAGE AND DIVORCE

corder in Idaho; county ordinary or his deputy in Georgia; and the county auditor in Washington. In the six New England States the license, or "certificate," as it is usually called, is issued by the clerk or registrar of the city or town; and in Massachusetts a town of more than 2,000 inhabitants may choose a person other than the clerk to be registrar. The laws of the various States show great diversity and lack of precision regarding the place of obtaining the license and that of making return of the celebration. In some States the license must be secured in the place of the bride's residence; in others, in that of the marriage; while in a third group, it may be issued in the place where either person dwells. Indeed, Pennsylvania, more liberal still, allows a choice among all three places. The same laxity exists as to the place of return; and sometimes the place of return is not the same as that of issue. There are other grave defects in the license laws. The oath administered to the bride or bridegroom by the officer, to guard against illegal contracts, is usually permissive, not obligatory; and where parental consent to the marriage of minors is given in writing, the affidavit of at least one witness is not always required. In Porto Rico the municipal judge may not grant or refuse a marriage license until ten days after the examination on oath of the persons applying therefor. Nowhere else is there any adequate provision regarding notice or the filing and trial of objections to a proposed marriage. Maine and Wisconsin have each made a good beginning by requiring the certificate or license to be procured five days before the celebration; and New Jersey exacts the same delay in case of non-residents. No other State seems to have a similar provision; and in all cases, apparently, except in Porto Rico, the license is issued at the time the notice of intention to marry is filed. But some of the States have provided special safeguards against clandestine marriages. Massachusetts has thus taken wise precautions regarding the licensing of young minors. By an act of 1894 no town or city clerk is permitted to receive a notice of the intention of marriage of any male under 18 or any female under 16 years of age, unless the "judge of probate in each county after due hearing" shall "make an order allowing the marriage under the age specified"; but such order may be issued only when the minor resides in the county where the judge holds court, or when the father, mother, or guardian gives consent. A law of 1899 allows the probate judge to make a similar order in case of a person of either sex whose age is alleged to exceed that just specified, but who is unable from any cause to produce official record of his or her birth, to overcome the reasonable doubt of the clerk or registrar. In Alabama, before issuance of a license for the marriage of persons under the ages of 21 and 18 respectively, the judge of probate, in addition to parental consent, "must also require a bond to be executed in the penal sum of two hundred dollars" payable to the State, "with condition to be void if there is no lawful cause why such marriage should not be celebrated." In all cases a similar bond is required in Arkansas, Indian Territory, and Tennessee; as also in Kentucky when the persons are personally unknown to the clerk. By

the code of Porto Rico (1902) the "persons desiring to contract marriage shall first present themselves before the municipal judge of their domicile if they shall have the same domicile, otherwise to their respective municipal courts and first being duly sworn, shall be examined by the municipal judge as to their legal capacities and incapacities to enter into matrimony."

Ceremony.—With two exceptions the optional civil or religious celebration is now authorized by all the States. In West Virginia, and in Maryland since 1777, only the religious ceremony is provided for. Elsewhere marriage may be solemnized before the ministers or priests of every denomination; religious societies having no priests; or before the civil magistrate. The laws are lax regarding the district within which the civil or clerical celebrant may act. Only in a very few instances, as in Massachusetts, Rhode Island, and Vermont, is authority conferred only upon ministers dwelling within the State; while in the great majority of States, although the statutes are often far from clear, all qualified ministers, residing anywhere in the United States, may act. Indeed, Louisiana is still more generous, granting full privilege to celebrate wedlock to any clergyman or priest, "whether a citizen of the United States or not." Nowhere are the minister's functions confined to the town, county, or other local district of his permanent residence, as was the case under the early laws of some of the older commonwealths. Only in a few cases are adequate proofs of ordination exacted. Virginia and West Virginia each require from the minister a bond for the faithful performance of his trust, in addition to credentials of ordination and good standing. Rhode Island has a careful system of registration; in Maine and New Hampshire the clerical celebrant must secure a "commission" from the governor; in Nevada, Minnesota, Wisconsin, and Arkansas, he must file his credentials with the proper county officer and receive a certificate; Ohio demands a license from the county judge of probate; but usually no such precautions are required. Throughout the country the justice of the peace is the "normal" civil magistrate for the celebration of wedlock; but usually the judges of the county and higher courts of record are given like authority. In Vermont the justice of the peace is the sole officer empowered. On the other hand, in Rhode Island, only justices of the supreme court may perform the lay ceremony; while in Virginia the justice of the peace as such is not recognized; but "the court of every county which deems it expedient, may appoint one or more persons resident in such county to celebrate the rites of marriage within the same, or a particular district thereof," provided a bond be given as in the case of the ordained minister. Besides the judicial magistrates, authority to solemnize wedlock is conferred *ex officio* upon a variety of other functionaries; as upon aldermen and police magistrates in New York; the governor in Idaho; city mayors in Iowa, Montana, Idaho, Utah, and South Dakota; speakers of the house and senate in Tennessee; and the county supervisors in Mississippi. At present only in 21 States is the justice of the peace or corre-

MARRIAGE AND DIVORCE

sponding local officer, in the discharge of his duties as celebrant, confined to his own county or district. Elsewhere he may act anywhere within the State; and this is almost universally the rule with the higher judges and officials who are granted the same power. In no case, except in Virginia and Massachusetts, is there any provision for the appointment of a person to celebrate wedlock for an area of less extent than the county; and nowhere, unless in Virginia, does the law provide for the special office of marriage celebrant. Massachusetts has, however, taken a step in the right direction. By an act of 1899 no justice of the peace may solemnize a marriage unless he also holds the office of city or town clerk, city registrar, clerk of a court, or that of assistant in each case; or "unless he shall have been specially designated by the governor." The latter may at his discretion name justices of the peace "who may solemnize marriages in the city or town in which they severally reside." Each place is to have at least one such designated magistrate; but otherwise the number is not to exceed one for every 5,000 of its inhabitants. No justice may act without a certificate of designation, which the governor has power to revoke whenever he thinks fit.

No definite formula for the celebration is anywhere prescribed. Sometimes the statute contains a statement to that effect. Thus in Tennessee it is expressly enacted that no formal ceremony is required, except that the parties "shall respectively declare, in the presence of the minister or officer, that they accept each other as man and wife"; and substantially the same declaration is specified in the laws of California, Idaho, Michigan, Minnesota, Nebraska, Nevada, North Dakota, South Dakota, Oregon, Pennsylvania, Washington, Wisconsin, and Wyoming. The same is true of New York when the ceremony is performed by a magistrate; but when a clergyman officiates, it may be "according to the forms and customs of the church or society to which he belongs." The Oklahoma law requires the marriage to be "contracted by a formal ceremony" in the presence of two witnesses. The consent of persons "who may be lawfully married," according to the North Carolina statute, "presently to take each other as husband and wife, freely, seriously, and plainly expressed by each in the presence of the other and in the presence" of a minister or justice, and the consequent declaration by him that they "are man and wife, shall be a valid and sufficient marriage." In New Hampshire persons living together and acknowledging each other as husband and wife, and generally reputed to be such for the period of three years or until the death of one of them, shall thereafter be deemed to have been lawfully married. A similar law exists in Arizona, except that the requisite period of living together is one year.

Witnesses.—The statutes of many of the States require witnesses at the ceremony. One witness must attend in South Dakota; two in Alaska, Idaho, Michigan, Montana, Minnesota, Nebraska, Nevada, North Dakota, Oklahoma, Oregon, Porto Rico, Rhode Island, Washington, Wisconsin, and Wyoming; three in Louisiana; while in New York one witness is sufficient when the celebration takes place before a minister or magistrate and two when the marriage is

by a written contract. In Maryland, in the case of Quaker weddings, the marriage certificate must be signed by 12 persons present. The statutory requirement of 12 witnesses in Pennsylvania is no longer enforced; but in that State two witnesses must attend "when any marriage is solemnized by the parties themselves." Sometimes, as in California and New Jersey, the statute seems to take for granted the presence of witnesses without expressly requiring it.

Certificates.—Provision for giving a certificate to the persons married, by request or otherwise, is made in Alaska, California, District of Columbia, Idaho, Iowa, Maryland, Michigan, Minnesota, Missouri, Montana, Nebraska, Nevada, New York, Oregon, Pennsylvania, Porto Rico, South Dakota, Washington, Wisconsin, and Wyoming. Elsewhere by custom certificates are doubtless usually given without direct legal requirement.

Records.—In California, Delaware, Idaho, Iowa, Kentucky, Michigan, Missouri, Nevada, New Mexico, New York, New Jersey, Ohio, South Dakota, and Wisconsin the celebrant is required to keep a record. The same is true of the Quakers in Maryland; and of the pastors of all religious societies in Alabama and Mississippi. Almost universally the clerk or other officer of the county or town must register the facts contained in the license issued or the certificate returned. Moreover 22 commonwealths have established State systems of registration. These are Arkansas, California, Connecticut, Delaware, Indiana, Iowa, Kansas, Kentucky, Massachusetts, Maine, Michigan, Minnesota, New Hampshire, New Jersey, New York, Pennsylvania, Ohio, Rhode Island, Vermont, Virginia, West Virginia, and Wisconsin. The New England States, in particular, have made careful provision for the completion and preservation of their marriage records; and for the collection and publication of marriage and divorce statistics.

Prohibitions.—The laws of all the States contain each a list or a definition of the kindred by blood or affinity with whom marriage is prohibited. In all cases, unless in Tennessee, expressly or by implication, marriage with a niece or a nephew is forbidden; while first cousins may not lawfully wed in Arizona, Arkansas, Illinois, Indiana, Indian Territory, Kansas, Louisiana (1900), Michigan (1903), Missouri, Nevada, New Hampshire, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania (1901), South Dakota, Washington, Wyoming, and apparently in Colorado. In Alaska persons related within the fourth degree either of the whole or the half-blood may not marry; while in Porto Rico (Code, 1902) the restraint extends to all descendants by blood or affinity and to "collaterals of consanguinity" within the fourth degree. In no case is marriage with a deceased wife's sister or a deceased husband's brother prohibited by the existing laws. As a general rule marriages within the forbidden degrees are void or voidable; but there are some exceptions, the statutes being often far from clear. The code of Porto Rico expressly provides that "the district courts may for good cause, on petition of an interested party, waive the impediment of the fourth degree of consanguinity." Marriages are everywhere prohibited and are rendered void or voidable for a great variety of causes other than

MARRIAGE AND DIVORCE

kinship or affinity; but the statutes are in this respect exceedingly conflicting and confusing, disclosing a great diversity of conditional or qualifying clauses which make any attempt at a summary here impracticable.

Miscegenation.—Nearly all the southern and some other States have enacted rigorous laws to prevent miscegenation, often defining the exact fractional part of African or Mongolian blood which shall vitiate a marriage. Such statutes against marriage with persons of negro blood exist in Alabama, Arizona, Arkansas, California, Colorado, Delaware, Florida, Georgia, Idaho, Indiana, Indian Territory, Kentucky, Louisiana, Maine, Maryland, Mississippi, Missouri, Nebraska, Nevada, North Carolina, Oklahoma, Oregon, South Carolina, Tennessee, Texas, Utah, Virginia, and West Virginia. The prohibition includes persons of Chinese or "Mongolian" blood in Arizona, California, Mississippi, Nevada, Oregon, and Utah.

Pauperism.—The statutes of several States are particularly interesting as indicating the most recent trend of social legislation. Thus Delaware has attempted to put some limit upon the increase of the indigent and incapable classes, the marriage of paupers being forbidden under penalty. Maine has a similar law; while in Vermont a license may not be issued for the marriage of paupers without the written consent of the selectmen or overseer of the poor of each of the towns where the parties reside, or which are liable for their support. Michigan has taken a still more important step in advance. By a stringent act of 1899 no person afflicted with certain syphilitic diseases "shall be capable of contracting marriage," transgression of the law being severely punished as a felony. In 1895 Connecticut prohibited the marriage of a couple either of whom is epileptic, imbecile, or feeble-minded, when the woman is under 45 years of age; and this enlightened policy was followed in laws containing the same prohibition by Minnesota in 1901 and by Kansas in 1903.

Common Law Marriages.—It remains to consider the so-called "common-law marriage" in its relation to the statutes. According to the prevailing doctrine of the courts the laws requiring license, solemnization, or other formalities must be interpreted as "directory," not "mandatory," unless they contain "words of nullity" clearly declaring marriages void if contracted contrary to their provisions. Thus the canonical conflict between "legality" and "validity" is in effect perpetuated in the United States; and it is a most fruitful source of evil. At present the validity of the informal or common-law marriage is sustained by the decisions of the courts in Alabama, Arkansas, Colorado, District of Columbia, Florida, Georgia, Illinois, Iowa, Indiana, Kansas, Louisiana, Michigan, Minnesota, Missouri, Nebraska, Nevada, Ohio, Pennsylvania, South Carolina, and Wisconsin; by the later decisions in Tennessee (1860-70), and Texas (1894-9); while it is favored by those of New Jersey. On the other hand, in 1810, Chief Justice Parsons of Massachusetts repudiated the common-law agreement, holding that a solemnization according to law was essential to a valid marriage. This precedent has been followed by the courts of Maryland, North Carolina, Oregon, Washington, Vermont, and West Virginia; and favored by the early de-

cisions of Maine and New Hampshire, although in those States the law is regarded as not conclusively settled. Furthermore Kentucky in 1852, Mississippi in 1892, California in 1895, Utah in 1898, and New York in 1901 have superseded the common-law contract through statutes containing the nullifying clause. In the remaining States the courts have not yet reached a decision; but were the question brought to a judicial test, the statutes remaining as they are, it is almost certain that, with one or two exceptions, all these commonwealths would sustain the validity of the informal agreement. It is clear that the needed reform can only be attained through stringent legislation.

II. DIVORCE.—The American type of divorce legislation has its origin in the provincial era. In the five southern colonies before the Revolution no instance of either full divorce or separation from bed and board has been discovered. The statute-book is entirely silent on the subject. Separations by mutual consent or for bad conduct or parol separations in some form did indeed occur; and in such cases the courts sometimes granted separate alimony. But in the South tribunals with either common law or statutory jurisdiction in divorce suits were not established; and no example of legislative divorce appears. The case is somewhat different for the middle colonies. In New York during the period of Dutch rule divorces were granted by the courts; and for a time after the English conquest in 1664 the magistrates may have continued the practice, doubtless under the supposed sanction of the Dutch law. But, unless on this ground during the brief period of transition, judicial divorce *a vinculo* ceased in New York with the English conquest. Courts competent to grant decrees for dissolution of marriage were not created. Except for a passage in the Duke's 'Laws'—which was a "dead letter"—there was no legislation on the subject. What has just been said of New York for the provincial era applies also to New Jersey. On the other hand, in Pennsylvania, a few absolute divorces were granted by the legislature; but there has been found no instance of a judicial decree for dissolution of wedlock.

Civil Divorce.—It was perhaps inevitable that civil divorce, the counterpart of civil marriage, should arise in the New England colonies. Liberty of divorce is the fruit of the Reformation; and it was especially favored by the more advanced or extreme Protestant societies. In most respects throughout New England the broad modern doctrines of the *Reformatio Legum* of Edward VI.'s commission, though even now not fully accepted in the mother country, were from the outset put in practice by Puritan and Separatist alike. The American conception of divorce as belonging, not to the criminal, but exclusively to the civil jurisdiction, has its birth in the 17th century. For more than 100 years in the New England colonies the canonical decree of separation from bed and board was practically though not wholly abandoned; while, on the other hand, a dissolution of the bond of matrimony was freely granted for adultery, desertion, and even on other grounds. For Massachusetts the records are but partially preserved. Between 1639 and 1692 some 40 actions for divorce or annulment have been discovered; while between 1739 and 1776

MARRIAGE AND DIVORCE

at least 47 such suits were tried by the courts. The complete record would doubtless disclose many more. The grounds of divorce are not formally specified in the statutes, but from these cases it appears that desertion by either party and adultery of the wife were accepted as adequate causes for dissolving a marriage. It should be noted that before the Revolution there is no clear instance in Massachusetts of granting a full divorce for the husband's adultery alone, unaccompanied by other offenses such as cruelty. The first discovered case of judicial separation from bed and board falls in the year 1754. Cruelty alone was deemed adequate ground for such separation, though, apparently, not for a full divorce. From 1650 onward Rhode Island authorized divorces *a vinculo*. By an act of that year, supplemented by other statutes in 1655 and 1685, adultery and desertion on the part of either spouse were recognized as legal grounds. This colony was especially afflicted by the evil of legislative divorce. Throughout nearly the entire provincial period the assembly, side by side with the courts, acted on divorce petitions, particularly when the grounds of complaint were not those recognized by statute. According to Judge Durfee, even after 1747, when the power to grant divorces came to the superior court, the jurisdiction of the assembly continued "to be invoked in exceptional cases, which either were not provided for by the statute or were too flimsy or too whimsical for judicial treatment" (*Gleanings*, 35-6). The divorce legislation of Connecticut gained a surprisingly early maturity. In the middle of the 17th century no society in the world, with the possible exception of Holland, possessed a system so modern in character. Separation from bed and board was rejected. Reasonable grounds of absolute divorce were sanctioned. Husband and wife were treated with even justice; and, although legislative divorce was permitted and liable to abuse the greater part of the litigation seems always to have been entrusted to the regular courts. As early at least as 1655 marriages were dissolved by the assembly; and in 1667 the first statute on the subject appeared. The court of assistants was then empowered to grant bills of divorce from the bond of wedlock, with the privilege of remarriage, for adultery, fraudulent contract, three years' wilful desertion with total neglect of duty, or for seven years' "providential" absence unheard of. These four grounds of absolute divorce, with scarcely the change of a word in the terms of the statute, were sanctioned by the laws of Connecticut until 1849, when two new causes—"habitual intemperance" and "intolerable cruelty"—were added.

State Legislation.—The essential principles of American divorce law were thus developed in the colonial period. Under the Federal Constitution the States within their respective borders have exclusive control of matrimonial and divorce legislation. Congress has conferred the same power upon the organized territories; but it legislates directly for the District of Columbia, Indian Territory, and Alaska. As a result there are fifty-two distinct divorce codes, whose provisions are inharmonious or conflicting, although in some of their vital features they are slowly approaching a common type. Almost everywhere exclusive jurisdiction in divorce suits is now vested in the district, superior, circuit, chancery,

or other higher courts, sitting usually in the various counties. In New Jersey the court of Chancery has entire control; but apparently in every other State a number of tribunals are open to hear and determine divorce petitions. In 1887, according to the report of Commissioner Wright, there were in the whole country about 2,624 such tribunals. But in no instance has a special divorce court been created. Formerly the granting of divorces by the legislature was a widespread evil. In nearly all the States, directly or indirectly, it is now prohibited by constitutional enactment; and since 1886 Congress has put a stop to it in the Territories. Delaware discontinued the practice only under the constitution of 1897; while in Connecticut it still survives.

Divorce is not provided for by law in South Carolina. In the other 52 States divorce is permitted; while separation from bed and board is likewise allowed in Alabama, Arkansas, Delaware, District of Columbia, Georgia, Indiana (1903), Indian Territory, Kentucky, Louisiana, Maryland, Michigan, Minnesota, Nebraska, New Jersey, New York, North Carolina, Pennsylvania, Rhode Island, Tennessee, Vermont, Virginia, West Virginia, and Wisconsin. Furthermore, in Florida, Iowa, Kansas, Montana, Ohio, Utah, and Wyoming, the courts may decree separate maintenance which is practically the same as separation from bed and board. The number of statutory grounds of divorce *a vinculo* varies from one (adultery) in New York and the District of Columbia to 14 in New Hampshire. Adultery is a cause in all these States; desertion (abandonment, wilful absence) in all except New York and the District of Columbia; cruelty (actual violence, inhuman treatment, etc.), in all except these two with Maryland, New Jersey, North Carolina, Tennessee, Virginia, and West Virginia; habitual drunkenness (intoxication, intemperance) in all except Arizona, District of Columbia, Maryland, New Jersey, New York, North Carolina, Pennsylvania, Texas, Vermont, Virginia, and West Virginia; failure to provide for wife (or family) in Arizona, California, Colorado, Delaware, Idaho, Indiana, Maine, Massachusetts, Michigan, Montana, Nebraska, Nevada, New Mexico, North Dakota, Rhode Island, South Dakota, Utah, Vermont, Washington, Wisconsin, and Wyoming. Incurable insanity is a legal cause in Florida and Idaho; lunacy of the wife in Pennsylvania; "incurable, chronic mania or dementia" of either party in Washington; and vagrancy of the husband in Missouri and Wyoming. By the statute of Rhode Island a marriage may be dissolved when either party is guilty of "habitual, excessive, and intemperate use of opium, morphine, or chloral"; and a similar law exists in Maine, Massachusetts, Mississippi and Porto Rico. Many other legal causes of divorce are recognized, each in one or more States. For the whole country in 1887, according to the government report, 42 grounds of absolute, and 32 grounds of partial divorce were thus sanctioned by statute.

RE-MARRIAGE.—There is equal lack of uniformity in the laws regarding re-marriage after divorce. No restraint whatever is placed on the immediate re-marriage of either party with another in Arizona, Arkansas, Connecticut, Illinois, Indian Territory, Iowa, Maryland, Kentucky,

MARRIAGE AND DIVORCE

Missouri, Nevada, New Hampshire, New Jersey, New Mexico, Ohio, Porto Rico, Texas, Utah, West Virginia, and Wyoming. Elsewhere restrictions are placed upon one or both of the parties either as a penalty or to allow time for proceedings in error or on appeal. Thus in Delaware since 1832 the person divorced for adultery is absolutely forbidden to marry the paramour. Marriage with the accomplice during the life of the former spouse is likewise unlawful in Pennsylvania since 1785, Tennessee since 1799, and Louisiana since 1827. Moreover, in Louisiana since 1808, the wife may not re-wed until 10 months after dissolution of the marriage, whether by death, divorce, or decree of nullity. Under the same conditions in Porto Rico the woman must wait 301 days, or until a child is born if pregnant at the time of the husband's death. By the North Carolina statute, where the ground of divorce is abandonment of the wife or such cruel treatment of her after removal to another State as to force her to return, the defendant is forbidden to marry again during the life of the aggrieved. The same restraint is laid on the defendant guilty of adultery in South Dakota and New York, although the parties to the action may re-marry. In New York, however, the defendant may marry again in case the court shall modify its judgment, "which modification shall only be made upon satisfactory proof that the complainant has re-married, that five years have elapsed since the decree of divorce was rendered, and that the conduct of the defendant since the dissolution of said marriage has been uniformly good." The person who is the guilty cause of the divorce is restrained from marriage in Florida. By the act of 1901, in the District of Columbia the defendant is absolutely restrained from re-marriage except with the former spouse. In several States the placing of a restraint on further marriage is left to the court's discretion. So in Michigan the court may decree that the person against whom any divorce is granted shall not re-wed within any period not exceeding two years. Since 1857 in Mississippi the decree may provide "that a party against whom a divorce is granted because of adultery shall not be at liberty to marry again." The same power is given the court in Virginia; but for good cause shown the tribunal rendering the decree of divorce may at any time remove the restraint on the marriage of the guilty party. By the existing code of Alabama, in all cases, the chancellor may in the decree direct whether the adverse party shall be permitted to marry again. In Georgia the jury according to whose verdict a decree of absolute divorce is granted determines the question of re-marriage, subject to the revision of the court; but provision is made for subsequent removal of any disability through the verdict of a new jury. Three of the New England States discriminate in this regard against the defendant. Since 1878, in Vermont, the libellee may not marry any person other than the libellant for three years, unless the latter dies. In Massachusetts since 1881 the offending party, without petition to the court, may re-marry only after two years. Since 1883 the statute of Maine forbids the party obtaining the decree to re-wed in two years without the court's permission; while during that period the adverse party is absolutely restrained; nor at any later

time may he marry without the court's consent. In Massachusetts, following the English precedent, the decree in the first instance must be a decree *nisi*, "to become absolute after the expiration of six months," unless the court on the application of some interested person otherwise orders. Since 1883 the law of Maine in this regard has been practically identical with that of Massachusetts; while in 1902 an act of Rhode Island declares that no decree shall become final and operative until six months after trial and decision. In New York the decree in the first instance must be "interlocutory," and three months must elapse before it can be made final. The latest legislation of California is somewhat similar. Until 1903 neither party was permitted to marry again within a year after the divorce. But persons evaded the law by going to Nevada, to get married, and then at once returning to California to reside. The validity of such contracts was sustained by a decision of the Supreme Court. To overcome the effect of this decision in the year named it was enacted that when the court "determines that a divorce ought to be granted an interlocutory judgment must be entered, declaring that the party in whose favor the court decides is entitled to a divorce." After the expiration of a year the court may enter final judgment. In no case can a marriage of either party during the life of the other be valid, if contracted within one year after the interlocutory decree. This act is believed to be unconstitutional, and one of the superior courts has so decided.

A number of States have fixed a period within which neither party may marry again; and usually, if proceedings in error or on appeal be instituted, the restraint is further extended to the final judgment. The period is three months after the decree in North Dakota since 1901; six months in Kansas since 1881, Minnesota since 1901, Nebraska since 1885, Oklahoma since 1893, Oregon since 1862, Washington since 1893; and "more than six months" in Idaho since 1903. It is one year in Colorado since 1893 and in Wisconsin since 1901; while in Montana since 1895 the innocent person must needs wait two years and the guilty person three years before renewing the marital bond with anyone save the former spouse. In Alaska neither party may marry a third person until proceedings are determined on appeal, or if there be no appeal, within one year after the decree. The Nebraska law, in addition to the general restraint on both parties during six months, is unique in forbidding the defendant in error or appellee to marry again during the pendency of proceedings in error or on appeal under the penalty prescribed for bigamy; while in Kansas and Oklahoma, if appellate proceedings be had, the restraint on both parties extends to 30 days after final judgment on appeal. Since 1831, by the Indiana statute, either party is free to marry again immediately after divorce, except that when the defendant has been "constructively" summoned without other notice than publication in a newspaper, the person obtaining a decree is not permitted to re-wed until the expiration of two years, during which period the judgment may be opened at the instance of the defendant. In Wisconsin the court or judge granting the divorce "may authorize" marriage within the year. Expressly or by implication a number of States

MARRIAGE AND DIVORCE

except from the prohibition the re-marriage of the divorced couple. Such is the case in Alaska, California, Colorado, Idaho, Kansas, Montana, New York, Oklahoma, Oregon, South Dakota, Vermont, and Washington. On the question whether in the absence of statutory authority such re-marriage of the divorced persons with each other comes within the restriction, the decisions of the courts are conflicting (see Moore *v.* Moore, 8 Abb., N. C., 171; Colvin *v.* Colvin, 2 Paige, 385; Moore *v.* Hegeman, 92 N. Y., 521). Owing to the want of precision and uniformity in the legislation of the States the restraints placed on the marriage of divorced persons are practically futile. In 1829 the supreme court of Massachusetts (in Putnam *v.* Putnam, 8 Pick., 433-5) decided that if a man, "being a resident in this State, for the sake of evading the law goes into a neighboring State where such a marriage is valid, and is there married and immediately returns and continues to reside here, the marriage is valid here, and after his death his widow is entitled to dower in his estate." This precedent was followed by New York in 1881 (Van Voorhis *v.* Brintnall, 86 N. Y., 18); Washington in 1900 (Willey *v.* Willey, 22 Wash., 115-121); and California in 1903, Estate of Wood, 137 Cal., 129). The prevailing doctrine of the courts appears to be that a marriage good where it is contracted is good everywhere; but there are opposing decisions.

Residence.—With the exception of Louisiana and, of course, South Carolina, all of the States make some statutory provision regarding the residence of the parties to a divorce suit. To prevent migration for divorce, the minimum requirement, where the plaintiff comes into the State after the cause of petition arose, has gradually been raised; but in some States the law is still too lax. At present the term of previous residence for the plaintiff, or at least for one of the parties, varies from six months to five years. It is six months in Nebraska since 1856, except when the marriage was solemnized in the State and the plaintiff has there dwelt since the marriage to the time when the suit is commenced; in Idaho since 1864; in South Dakota since 1899; while in Nevada since 1861 the plaintiff must have resided six months in the county where suit is brought, unless the action is begun "in the county in which the cause thereof shall have accrued, or in which the defendant shall reside, or be found, or in which the plaintiff shall reside if the latter be the county in which the parties last cohabited." In Texas likewise the term for the plaintiff is six months in the county. The prevailing requirement is one year. Such is the case in Arizona, Arkansas, Indian Territory, New Mexico, Ohio, and Oklahoma; in California since 1891; Colorado since 1861, unless the application is made upon "grounds of adultery or extreme cruelty" and the offense is "committed within the State"; Georgia, where six months in the county is also prescribed; Illinois since 1827; and Porto Rico since 1902, unless the cause arose in the State or while one or both of the parties resided there; Iowa since 1838, except when the defendant is a resident of the State served by personal service; Kansas since 1855; Kentucky, where, as in Arkansas and Indian Territory, if the cause of divorce arose without the State the plaintiff must have been a resident of the State

at the time, unless it was also a legal ground where it occurred or existed; Minnesota since 1851, except when the suit is on the ground of adultery committed while the plaintiff was a resident of the State; Missouri since 1835, unless the offense or injury complained of was committed within the State or when one or both of the parties resided there; Montana since 1865; North Dakota since 1899; Oregon since 1862; Pennsylvania since 1785; Utah since 1878; Vermont since 1878, three months' residence in the county of the action being also required; Washington since 1854; Wyoming since 1901; and Wisconsin since 1838, except when the cause is adultery committed while the plaintiff was a resident of the State, or when the marriage was solemnized in the State and the plaintiff has there resided since the marriage to the time of bringing suit, or when the wife is plaintiff and the husband has resided in the State for one year. The term of domicile or residence for at least one of the parties is also one year in New Hampshire, Virginia, and West Virginia; while in Mississippi the courts of chancery have jurisdiction when both parties are domiciled in the State when suit is brought; or when the complainant is so domiciled and the defendant is personally served with process in the State; or when one of the parties is thus domiciled and one or the other of them has been an actual resident for the preceding year. In Maine a divorce may be granted for legal cause if the libellant resided in the State when the cause of action occurred, or had so resided for one year before commencement of the suit, or if the libellee is a resident of the State (1903). A two years' term is prescribed for the plaintiff in North Carolina and Tennessee; in Florida unless the offense charged is adultery; in Maryland, for at least one of the parties, since 1842; in Indiana since 1873, six months in the county being also essential; and in Rhode Island since 1902, unless during that period the defendant has been a resident and domiciled inhabitant of the State and has actually been served with process. In Michigan since 1899, if the marriage was not solemnized in the State, the term of previous residence for the plaintiff is one year when the ground of action arises within, and two years when it arises outside the State. By Federal law two years' residence is required in Hawaii (1900), and two years' inhabitancy in Alaska (1903); while in the District of Columbia since 1901 the term of previous residence for the plaintiff is three years. A three years' period of "continuous" residence is likewise exacted in Connecticut, unless the cause of divorce arose after the plaintiff's removal into the State; or unless the defendant had in like manner there resided for three years and actual service was made upon him; or "unless the alleged cause is habitual intemperance, or intolerable cruelty, and the plaintiff was domiciled in the State at the time of the marriage" and before bringing the complaint has returned with the intention of there remaining. In Alabama, when the defendant lives outside the State, the plaintiff must have been a *bona fide* resident for one year before bringing suit; or for three years when abandonment is the cause alleged. By the New Jersey statute, in case of abandonment, one of the parties, at the time of filing the bill and for the term of two years during which the

MARRIAGE AND DIVORCE

desertion shall have continued, must be a resident of the State; but when the cause is adultery committed outside the State, three years' residence on the part of either the complainant or the defendant is required. New York has no fixed term, except that in case of partial divorce, when the marriage was solemnized outside the State, the parties must have "continued to be residents" for at least one year, and the plaintiff must be resident at the time the action begins. No definite term is prescribed by the Delaware law; but a divorce from the bond of matrimony will not be decreed when the assigned cause took place out of the State and the "petitioner was a non-resident thereof at the time of the occurrence, unless for the same or like cause such divorce would be allowed by the laws of the State in which it is alleged to have occurred." Finally, it may be noted that Massachusetts has the most stringent requirement. A divorce will be granted for any lawful cause, occurring in the State or elsewhere, when the libellant has lived for five years in the commonwealth; or, when the parties were inhabitants of the State at the time of the marriage, if the libellant has been such an inhabitant for three years before the libel was filed, provided neither came into the State for the purpose. With these exceptions, as expressly provided in the statute, a divorce will not be granted for any cause, if the parties have never lived together as man and wife in the commonwealth; nor for any cause occurring in another State or country, unless, before it occurred, they had so lived together in the commonwealth, and one of them was there living at the time it took place.

Massachusetts, like Maine, Delaware, and Tennessee, has attempted to prevent clandestine divorce through the evasion of the laws. When an inhabitant of the commonwealth goes outside the State to obtain a divorce for a cause which occurred in the State while the parties there resided, or for a cause which would not be recognized as lawful therein, the "divorce so obtained shall be of no force or effect" in the commonwealth.

Notice by Publication.—Nearly all of the States have made some provision regarding notice to the defendant in divorce suits. The majority are content to prescribe the usual procedure employed in ordinary civil or equity cases, according to the system in use. But some States have adopted special rules; and during the last 15 years a number of the older and a few of the younger commonwealths have enacted rigorous laws governing notice to the defendant when personal service cannot be had. But the abuse of constructive service through publication in the newspapers is still a widespread evil.

Alimony.—Everywhere the laws provide for temporary and permanent alimony to the wife, for the care and custody of the minor children, and for the disposal of the property in a few instances, as in Massachusetts, New Hampshire, Oregon, Vermont, Virginia, Washington, and West Virginia, the courts are authorized to decree alimony or an allowance in the nature of alimony to the husband as well as to the wife. Generally divorce may be refused when there is collusion, connivance, condonation, or recrimination. Special provisions for defending divorce petitions exist in a number of States.

Thus in Indiana and Washington the prosecuting attorney must resist all undefended petitions; in Kentucky the county attorney must resist every application for divorce whether defended or not; in Louisiana, when the defendant is absent or incapable of acting, an attorney shall be appointed by the court to defend him; in Michigan the prosecuting attorney shall appear in all suits where there are children under 14 years of age, and oppose the granting of a decree if he thinks their interest or the public good so requires; and similar laws exist in Idaho, Colorado, Oregon, and the District of Columbia. Soliciting divorce business by advertising or otherwise is sometimes prohibited under severe penalty; such being the case in California, Indiana, Minnesota, Ohio, and Washington. Only in Connecticut, Illinois, Indiana, Maine, Massachusetts, Michigan, New Hampshire, Ohio, Rhode Island, and Vermont apparently, is any adequate provision made for the collection or publication of divorce statistics.

Statistics.—Thus the divorce laws of the States, though still very defective and conflicting, show distinct improvement during recent years. More stringent provisions for notice have been made; longer terms of previous *bona fide* residence of the plaintiff required; more satisfactory conditions of re-marriage after the decree prescribed; while some of the dangerous "omnibus" clauses in the list of statutory grounds have been repealed. All this is due to a better informed public sentiment in the creation of which much credit must be given to the State Commissions on Uniform Legislation and especially to the National Divorce Reform League and its successor, the National League for the Protection of the Family. By the League, at the instance of its secretary, the Rev. Samuel Dike, was suggested the compilation of the elaborate 'Report on Marriage and Divorce in the United States,' prepared by Hon. Carroll D. Wright, Commissioner of Labor, and published in 1889. This report for the first time revealed something like the real facts regarding divorce in the United States. In the entire country during the period of 20 years (1867-86) covered by it, 328,716 petitions for full or partial divorce were granted. From 9,937 decrees in 1867, the number rose to 11,586 in 1871; 14,800 in 1876; 20,762 in 1881; and to 25,535 in 1886; showing an increase in 20 years of 157 per cent, while there was a gain in population of but 60 per cent during the same period. Comparing the last year with the first, only four States—Delaware, Connecticut, Maine, and Vermont—show a decrease in the divorce rate; while, more fairly, comparing the fourth quinquennium with the first, only the three States last named show such a decrease. Of the whole number of divorces during the period, 112,540 were granted to the husband, and 216,176 to the wife. Among the principal causes, at each stage of the wedded life, only for adultery, were more decrees granted on the husband's petition than on that of the wife. But the relative number granted on the wife's petition varies greatly; from 39.3 per cent in North Carolina to 77.9 in Nevada. "As regards the ratio of divorces to marriages, six States report marriages fully enough for a trustworthy comparison. Of these, Connecticut has for the entire period a divorce to 11.32 marriages, and for the worst year, 1875, one to

MARRIED WOMAN — MARRYAT

8.81; Rhode Island gives one to 11.11 for the period and one to 9.36 in 1884, closely approaching that for three preceding years; Vermont one to 16.06 for the period and at its worst, 1871, one to 13; Massachusetts gives one to 31.28 for the period, its worst being one to 22.54 in 1878; Ohio averages one to 20.05, with an almost unvarying progress downward to one to 15.16 in 1886; and in the District of Columbia the rate for the period is 31.28, while at the best it is 74.65 in 1868, and at the worst 20.82 in 1877 (Dike in 'Political Science Quarterly,' iv., 607, summarizing Wright's Report, 135-39). This method of obtaining the rate is defective; for it disregards the large number of married couples whose marriages were solemnized before the period began. Hence, estimating the number of existing married couples, on the basis of the 11th census, in 1867, there were 173 divorces to 100,000 couples, and 250 in 1886 (Willcox, 'The Divorce Problem,' 2d ed., 16-19). The divorce rate in the United States is higher than in any other country for which divorce statistics are collected and published, with the single exception of Japan, being lowest in the southeastern and highest in the western and southwestern States. As in Europe, the divorce rate is higher and the marriage rate lower in the city than in the country. Again, as in Europe, while the marriage rate per capita of population is steadily descending, the divorce rate is on the average rising, although during the 20 years in the North Atlantic group of States—from Maine to Pennsylvania inclusive—there was no increase in the divorce rate.

According to Willcox the number of persons divorced (not the number of divorces) to every 100,000 of the population is as follows for various countries, the date being 1886 unless otherwise stated: Ireland, .28; Italy (1885), 3.75; England and Wales, 3.79; Canada, 4.81; Australia (including New Zealand and Tasmania), 11.14; German Empire, 25.97; France, 32.51; Switzerland, 64.49; United States, 88.71; Japan, 608-45 ('A Study in Vital Statistics,' in 'Political Science Quarterly,' viii., 78). In the United States, as elsewhere, both the marriage rate and the divorce rate fall during war times and in periods of general industrial depression. According to the statistics presented in Wright's Report, the evil of migration for easy divorce has been much exaggerated in popular opinion. The improvements in the laws since 1886 have placed further restraints upon it; so that it can no longer, if ever, be regarded as the centre of the divorce problem. In the want of a later report—for which there is urgent need—the present divorce rate for the whole country cannot be determined. But from the available statistics furnished by the few States publishing reports it appears that in Rhode Island, Michigan, Ohio, and notably in Indiana the rate is rising; while it is falling in Connecticut and Massachusetts. It is probable that some other State would show a decreasing rate.

Generalisation.—In conclusion it may be noted that the earlier movement for a uniform Federal law of divorce, to be secured through constitutional amendment, has in the main been abandoned. Instead it is preferred, through the State Commissions on Uniform Legislation, to urge the adoption by the separate commonwealths of a model statute governing procedure,

which has been recommended by the commissions. See also *DIVORCE*.

Bibliography.—A digest of the laws of all the States for 1886-7, the time of compilation, is contained in Wright's 'Report on Marriage and Divorce in the United States' 1867-86 (Washington 1889); reprinted without change (1897). See also the summaries in Stimson, 'American Statute Law' (1886); Noble, 'Compendium and Comparative View of the Thirty-Eight State Laws of Marriage and Divorce' (1882); Hirsh, 'Tabulated Digest of the Divorce Laws of the United States' (1901); Lloyd, 'Treatise on the Law of Divorce' (1887); Convers, 'Marriage and Divorce in the United States' (1889); Snyder, 'The Geography of Marriage or the Legal Perplexities of Wedlock in the United States' (1889); Whitney, 'Marriage and Divorce' (1894); Woolsey, 'Divorce and Divorce Legislation' (1882); Pearson, 'National Life and Character' (1893); answered by Muirhead, in 'International Journal of Ethics,' vii. In favor of radical reform are Stetson, 'Women and Economics' (1900); Besant, 'Marriage; as it was, as it is, and as it should be'; Pearson, 'Ethics of Free Thought' (1888); and Caird, 'The Morality of Marriage' (1897).

Marrow, a substance of low specific gravity filling the cells and cavities of the bones of mammals. See *BONE*.

Marryat, măr'i-at, Florence, English novelist, daughter of Frederick Marryat (q.v.): b. Brighton 9 July 1838; d. London 27 Oct. 1899. She was successively Mrs. Church (1854-90) and Mrs. Francis Lean. Her many novels, although not at all remarkable, were popular, and were published in various versions throughout Europe. They include 'Nelly Brooke,' 'Fighting the Air,' 'Facing the Footlights,' and more than 80 others, many being occupied with spiritualism. She published and edited her father's 'Life and Letters' (1872).

Marryat, Frederick, English naval officer and novelist: b. London 10 July 1792; d. Langham, Norfolk, 9 Aug. 1848. In 1806 he entered the navy, served on the coast of North America in 1811 in the *Æolus* and in 1823 was commander of the *Larne* during the first Burmese war, in 1825 had the naval command of a successful expedition up the Bassein River, and in the same year was made captain of the *Tees*. From 1828 until his resignation in 1830 he commanded the *Ariadne*. He received the gold medal of the Royal Humane Society (1818) for saving life at sea; adapted to the mercantile marine Sir Home Popham's system of signaling; was elected fellow of the Royal Society in 1819; and was also something of a caricature artist. He is best known, however, for his stories of the sea, beginning in 1829 with 'The Naval Officer.' The most familiar of them is 'Midshipman Easy' (1836), in which his chief characteristics, lifelike and circumstantial narration and a rollicking humor, appear perhaps at their best. Others of the series are 'The King's Own' (1830), probably the best constructed of his works; 'Newton Forster' (1832); 'Peter Simple' (1834); 'Jacob Faithful' (1834); 'The

Pacha of Many Tales' (1835); 'The Pirate, and the Three Cutters' (1836); 'Snarleyyow' (1837); 'The Phantom Ship' (1839); 'Poor Jack' (1840); 'The Privateer's Man' (1846). He wrote also a series of juveniles, chief of them 'Masterman Ready' (1841). He visited Canada and the United States in 1837-8; and recorded his impressions in 'A Diary in America' (1839), which gave some offence to the people of the nation, then hypersensitive to foreign criticism. In 1832-5 he edited the 'Metropolitan Magazine,' in which he published a review of N. P. Willis' 'Pencilings by the Way,' which the latter, then in England, considered abusive. Willis challenged Marryat, and they exchanged shots at Chatham without injury. Consult F. Marryat (q.v.), 'Life and Correspondence' (1872); Hannay, 'Life' (in 'Great Writers' series).

Mars, Anne Françoise Hippolyte Boutet Monvel, än frän-swäz ë-pô-lët boo-tä môn-vël mäs, usually called **MADemoiselle MARS**, French actress: b. Paris 5 Feb. 1779; d. there 20 March 1847. As Célémène in Molière's 'Misanthrope,' and Elmira in 'Tartuffe,' as well as in several similar characters in the plays of Marivaux, she was very great. Louis XVIII. settled on her, as well as on Talma, a pension of 30,000 francs. She retired in 1841.

Mars, mäs, in astronomy, a planet, 141,000,000 miles from the sun. Its diameter is 4,200 miles. Its years contain 687 days. Its mean distance at opposition from the earth is 48,000,000 miles. The day on Mars is half an hour longer than ours, or about 24 hours and 37 minutes. It has two moons. It moves at the rate of 15 miles a second. Mars is the fourth planet from the sun, and is called the red planet, from its well-known color. The combination of its motion with ours causes it to pass behind us, or opposite to the sun, once in two years. For two months at this period it is best seen, and appears as a red lamp in the sky; at other times it looks small and unimportant. Its density and size are less than ours; a man weighing 200 pounds here would weigh but 75 pounds on Mars. The orbit of this planet is decidedly elliptical; it is 26,000,000 miles nearer the sun at the nearest part of its orbit than it is at the farthest, consequently the variation in heat from this cause alone is considerable. In many ways Mars resembles our earth; it has atmosphere, seasons, land, water, storms, clouds, and mountains. Snow and ice cover both its poles, and produce great white patches at those points, which are clearly seen through a large telescope; they are found to vary in size with the seasons, being largest during the Martian winter. The canals were first mapped in large numbers by Schiaparelli, although a few of them had been previously observed by other astronomers. They consist of narrow dark lines, generally straight, forming a network over the whole surface of the planet. At their junctions we often find small black dots, known as lakes or oases. Large areas of the planet, called seas, are of a dark gray color, but most of the surface is yellow, or, if observed by daylight, orange. The cause of all the dark regions is probably vegetation, with the exception of the two very black lines which are seen to surround the snow caps when they are melting. These two lines are temporary in their nature, and form the only true oceans of the

planet. Occasionally they attain a breadth in some places of 300 or 400 miles, and are then found to be of a dark blue color. The polariscope shows that, unlike the rest of Mars, their surfaces are shiny. The yellow regions are thought to be deserts. They cover more than half the entire surface. Very marked changes sometimes appear in the finer details when the snow is melting most rapidly. At the approach of the Martian autumn those parts of the dark areas that are near the poles are seen to fade out and turn yellow so as to be indistinguishable from the soil of the planet.

The moons of Mars were discovered by Asaph Hall in 1877. The outer and smaller one is probably less than 10 miles in diameter. The inner one revolves about the planet in seven hours and a half, apparently rising in the west, and goes through all its phases in a single night.

W. H. PICKERING,
Assistant Professor of Astronomy, Harvard University.

Mars, in Roman mythology, contracted from *Mavers* or *Mavors*, in the Sabine or Oscan language *Mamers*, was at an early period identified by the Romans with the Greek *Ares*. As the Italian Mars was originally a divinity of a very different nature, the two conceptions must be treated separately. Originally Mars was an agricultural deity surnamed *Silvanus*, and propitiatory sacrifices were offered to him as the tutelary god of fields and flocks. As the Italian shepherds were familiar with war, the transition from the idea of Mars as an agricultural to that of a warlike deity was natural and easy. He was regarded as the father of the Roman people, for, according to tradition, Romulus and Remus, the founders of Rome, were the fruit of his intercourse with Rhea Sylvia. Several temples in Rome and the Campus Martius were dedicated to him, the most important of which was that outside the Porta Capena, on the Appian Road, and that of Mars Ultor, built by Augustus in the forum. His service was celebrated not only by particular *flamines* devoted to him, but by the College of the Salii, or priests of Mars. The month of March, the first month of the Roman year, was sacred to him, and his festivals were celebrated every year in the Circus on the 1st of August. The Campus Martius, where the Roman youth engaged in athletic and military exercises, was named after him. See *ARES*.

Marsala, mäs-sä'lä, Sicily, a seaport town, near the mouth of a river of the same name, on the low promontory of Cape Boeo, 18 miles southwest of Trapani. It obtained its name from the Saracens, who valued the port so highly that they called it Marsa Alla, or Port of God. The harbor has been greatly improved. The most important export is Marsala wine, which resembles sherry. Pop. (1901) 57,567.

Marseillaise, mäs-së-yäz, the celebrated song of the French Revolution, and the national anthem of the French. It was composed by Joseph Rouget de Lisle (q.v.) while an officer in the engineer corps at Strasburg, early in the French Revolution, with a view of supplanting the vulgar songs then in vogue. He composed the song and the music in one night. It was at first called 'Chant de Guerre de l'Armée du Rhin,' but subsequently received its present

MARSEILLES — MARSH

name because it was first publicly sung by volunteers from Marseilles in July, 1792. It became the national song of the French republicans, and was soon known through Europe and America. The tune is peculiarly stirring. It was suppressed under the first empire and the Bourbons, but the revolution of 1830 called it up anew, and after being suppressed under the second empire it is again the recognized national anthem of the French.

Marseilles, mär-sälz', or **Marseille**, mär-sä-yě, France, the principal commercial seaport of the country, a first-class military and naval station, the second city of France as regards population, and the capital of the department of Bouches-du-Rhône, 508 miles southeast of Paris. It stands on the northeastern shore of the Gulf of Lyons, and on a bay containing a group of islets, one of which, the Château d'If, has world-wide celebrity in connection with the elder Dumas' 'Monte Cristo.' The city is strongly defended by various works, and lies in the form of an amphitheatre round a natural harbor of moderate size (about 70 acres), known as the Old Harbor. The New Harbor consists of a series of extensive docks or basins along the shore to the northwest, with a protecting breakwater in front. From the Old Harbor one of the finest of the city thoroughfares, called the Cannebière, runs inland in a straight line; while at right angles to this another great thoroughfare traverses the city, planted with trees, lined with fine edifices, and bearing different names at different points. In the older part of the town the streets are narrow and irregular, but in general the streets are spacious and regular, and lined with handsome houses. Marseilles, however, is not rich in public edifices. The chief are the large cathedral, in the Byzantine style, consecrated in 1893; the church of Notre Dame de la Garde, a modern Romanesque building, on a hill of same name, whence a splendid view is obtained; the church of St. Victor, a building of great antiquity; the Hôtel de Ville, the Prefecture, the Palais des Arts de Longchamp, containing a picture-gallery and natural history museum; the exchange; the public library (102,000 vols.); the palace of justice or law courts; the episcopal palace, etc. Marseilles is the see of a bishop, and possesses a court of first instance, a mint, an Academy of Sciences, Belles-lettres, and Arts, various learned societies and educational institutions.

Marseilles improved greatly in regard to street architecture, sanitary matters, etc., and made great progress in extent, population, and commerce, largely owing to the conquest of Algeria and the opening of the Suez Canal. Since 1855 some 200 acres have been added to the previous harbor accommodation. From the Durance an abundant water supply has been derived. A canal irrigates the neighboring slopes and plains, and has transformed them from arid tracts into fruitful fields. The surrounding districts are now occupied by a new population, employed in raising vegetables, fruit, etc., on the reclaimed and improved lands.

The most important manufactures are soap, soda, and other chemical products; also olive and other oils, sugar, machinery, iron and brass works, matches, candles, glass, earthenware, oriental hosiery, etc. In the building-docks a great number of war and other vessels are built. The

trade consists chiefly of soap, olive-oil, wine, brandy, corn, flour, dried fruits, oranges, and other products of the southern departments; salt provisions, tobacco, wool, skins and hides, iron, raw cotton, cotton twist, dyewoods, and other articles of colonial produce.

Marseilles was founded by a colony of Greeks from Asia Minor about 600 years before Christ, the original name being Massalia, and the Greek language is said to have been spoken here for several centuries before Christ. Its progress for centuries was rapid and almost without interruption. Having taken the part of Pompey in the great contest for supremacy between him and Cæsar, it was besieged by the latter and taken in 49 B.C. On the decline of the Roman Empire it became a prey to the Goths, Burgundians, and Franks. In 735 it fell into the hands of the Saracens, who completely destroyed all the ancient monuments which previous barbarians had spared. In the tenth century it fell under the dominion of the counts of Provence, and for some centuries after followed the fortunes of that house. Pop. (1901) 494,769.

Marsh, George Perkins, American scholar and diplomat; b. Woodstock, Vt., 15 March 1801; d. Vallombrosa, Italy, 23 July 1882. He was graduated at Dartmouth in 1820; studied law at Burlington; was elected to the Supreme Executive Council of Vermont in 1834; sat in Congress from 1842 to 1849, when he went to Constantinople as minister for four years; and in 1852 was sent on a special mission to Greece. In 1861, after seven years in the United States, he went to Italy as minister, and held that post until his death. An able English philologist, Marsh wrote 'Lectures on the English Language' (1861), 'The Origin and History of the English Language' (1862), 'Man and Nature,' in which he urged forest planting and forest preservation (1864), etc. He edited Wedgewood's 'Etymology' and translated Rask's 'Icelandic Grammar.' Consult the 'Life and Letters' edited by his widow (1888).

Marsh, Othniel Charles, American palæontologist; b. Lockport, N. Y., 29 Oct. 1831; d. New Haven, Conn., 18 March 1899. He was graduated from Yale in 1860, studied in 1860-2 at the Yale (now the Sheffield) Scientific School, in 1862-5 at the German universities of Berlin, Heidelberg, and Breslau, and from 1866 until his death was the first professor of palæontology at Yale. From 1882 he was vertebrate palæontologist to the United States Geological Survey, his field-work for the survey ceasing in 1892. His investigations in regard to extinct vertebrates are very important, and were declared by Charles Darwin to furnish some of the most satisfactory evidence of the evolutionary theory. He made particular study of the Rocky Mountain region, and from 1868 almost annually organized and conducted expeditions into that district. In these explorations he discovered over 1,000 new fossil vertebrates, of which he classified and described more than one half. Among his discoveries are those of the *Odontornithes*, a sub-class of cretaceous birds, with teeth; the *Dinocerata*, ungulate animals of the Eocene period, elephantine in size; the first known American pterodactyls, or flying lizards; and several new families of dinosaurs. Perhaps he was best known for his study of the primitive horse, the *Eohippus*, *Orohippus*, and *Ephippus*. In 1890-9 he made

researches in the geology of the region between the Appalachian range and the Atlantic. He was curator of the geological collection of the Yale museum of natural history in 1867-99, and in 1898 presented to the university his own collections. He was a nephew of George Peabody (q.v.), and it is said to have been at his suggestion that the Peabody Museum at Yale was established. In 1887 he was made honorary curator of vertebrate paleontology in the United States National Museum, and in 1898 received the Cuvier medal of the French Academy of Sciences. He was president of the American Association for the Advancement of Science in 1878, and of the National Academy of Sciences in 1883-95. From a bibliography of 237 titles, these works by him may be cited: 'Odontornithes: A Monograph on the Extinct Toothed Birds of North America' (1880); 'Dinocerata: A Monograph of an Extinct Order of Gigantic Mammals' (1884); and 'The Dinosaurs of North America' (1896). Consult memoir by C. E. Beecher in the 'American Journal of Science,' June 1899.

Marsh, Richard, English novelist. Among his novels, several of which have been reprinted in this country, are 'Mrs. Musgrave and her Husband' (1895); 'The Crime and the Criminal' (1896); 'The Beetle: a Mystery' (1897); 'Tom Ossington's Ghost' (1897); 'Frivolties' (1899); 'Ada Vernham: Actress' (1900).

Marsh, Sylvester, American engineer: b. Campton, N. H., 30 Sept. 1803; d. Concord, N. H., 30 Dec. 1884. In 1826 he established a provision business in Boston, in 1833 in Chicago, and from 1837 was in the grain trade at Chicago. He originated the meat-packing industry and is regarded as one of the founders of Chicago. From 1864 he resided in New Hampshire. On 25 June 1858, he obtained a charter for a railway to the summit of Mount Washington, a project deemed so impossible that he was called "crazy Marsh." The railway, 2.81 miles long, with an ascent of 3,625 feet, was completed in July 1869. The chief feature in the operation of the road is a central cog-rail. Similar roads were built on the Rigi, Switzerland, and on Green Mount, Mount Desert, Maine.

Marsh Crocodile, or **Muegger**, the common inland crocodile of India, locally venerated by the Hindus, to whom it is known as "Muegger." It inhabits the tanks and marshes of India and Ceylon; and suitable places westward almost to the Persian coast, and eastward throughout the Malay peninsula and islands. It is dark, olive-brown in general color above, lighter on the ventral surface; the young are paler, with black spots. A specimen 12 feet long is considered large, but instances of a length of 18 feet have been recorded. The head is rough-coated, but has no ridges; the snout is broad, and the teeth number 76. These crocodiles swarm in river-marshes, weedy ponds and artificial reservoirs, throughout their range, feeding on fish and small animals, and little feared by horses, cattle or human beings, for in general they are cowardly and reluctant to attack men or even to resist injury. In case the water of their home dries away, they migrate to other pools; and in seasons of drouth are likely to be met with anywhere wandering in search of water; as a last resort they will bury themselves in the mud and remain in a torpor until revived by the

coming of rains. These reptiles display considerable cunning in capturing their food and in avoiding harm, feigning death very cleverly. They are kept in a semi-domesticated condition in many parts of India by pious Hindus, whose priests build temples near the great ponds, protect and feed the reptiles, and imagine the service pleasing to the gods as well as profitable to themselves. Extensive descriptions of the animal and of its worship may be found in the zoological works of Blanford, Jerdon, Tennent, Gadow and others, and in such volumes as Adams' 'Wanderings of a Naturalist in India' (Edinburgh 1867), and Hornaday, 'Two Years in the Jungle' (New York 1885).

Marsh Gas. See METHANE.

Marsh Hare. See HARES.

Marsh Hawk, or **Harrier**, a migratory hawk (*Circus cyaneus*) of medium size, commonly known in one or another of its varieties throughout the north temperate zone, which frequents marshy meadows, where it makes its nest upon the ground in a tussock of grass, and lays five to seven roundish, dirty white eggs. In such places it finds its food, chiefly mice and frogs, and sails slowly back and forth close to the ground watching keenly for movements in the grass and ready to pounce upon its prey. Its wings are long and its flight may be swift and powerful when occasion demands, but it was accounted "ignoble" among falconers. It rarely seizes birds or even young poultry, although one of its names is "hen-harrier," and should be protected and encouraged by farmers as one of the most useful and persistent mousers. This hawk may be readily recognized by the broad patch of white on the rump displayed by both sexes. The male is dull grayish-blue, in general tint, and the female rusty brown, both streaked with white. Consult Coues, 'Birds of the Northwest' (1874).

Marsh-hen. See MUD-HEN.

Marsh Mallow, a coarse, large-leaved herb (*Althea officinalis*), of the Old World, but naturalized in marshy places along the eastern coast of the United States, which is related to the hollyhocks (q.v.); the flowers are pale rose-color, some in a terminal spike and some axillary. Its root is mucilaginous, and of service as a demulcent in medicine, but it is mainly used as a basis for the confection called "marsh-mallow." Compare MALLOW.

Marsh-marigold. See COWSLIP.

Marsh-trefoid, a handsome marsh plant. See BUCK-BEAN.

Marsh-wren, either of two species of American wrens that inhabit reedy marshes. They have the diminutive brown bodies, short wings and tails, the latter often held cocked up over the back, awl-like bills and inquisitive activity characteristic of wrens (q.v.) generally. One is the long-billed (*Cistothorus palustris*), most numerous in the salt-marshes along the Atlantic coast; and the other the short-billed, better known about inland lakes and rivers. The former is somewhat the larger, has a decidedly longer bill, and lays eggs dark chocolate in color, while the eggs of the short-billed species are pure white. Both make elaborate nests in the form of ball-like baskets, with a little entrance at the side, woven of leaves of wild rice

MARSHAL — MARSHALL

or marsh grasses, and fastened to the stems of the reeds. A curious habit of the species is that each pair will make several nests each season, only one of which serves the purposes of incubation. These wrens give in the spring an exceedingly pretty, chattering song, and when dozens are singing together in a patch of reeds the effect is most pleasing.

Mar'shal, a Federal officer appointed by the President in each judicial district, and corresponding to the sheriff of a county. His duty is to execute all precepts directed to him, issued under the authority of the United States, and is under the jurisdiction of the United States district and circuit courts. Sometimes police officers in American towns are known as marshals. In some European countries the title of marshal confers the highest military distinction, that of Marshal of France being especially prized. The word is derived from the Old High German word *marah*, a horse; and *scalh*, a servant; hence *Marascalh*, a man appointed to take care of horses. The marshal of the German empire derived his origin from the Frankish monarchs, and was equivalent to the *comes stabuli* or *connétable*. He was bound to keep order at the coronation of the emperor, and to provide lodgings for the persons connected with the ceremony. He was called *arch-marshal*, a dignity belonging to the electorate of Saxony. At the coronation it was his duty to bring oats in a silver vessel from a heap in the open marketplace, and to present the vessel to the emperor. His duties were discharged by a hereditary marshal (*Erbmarschall*). In Prussia general field-marshal is the highest military honor. In England field-marshal is given as an honorary rank to general officers who may have no immediate command. Marshal also signifies a person who regulates the ceremonies on certain solemn celebrations or, as in the United States, at parades, street processions, etc.

Marshall, mār'shal, Alfred, English economist: b. London 26 July 1842. He was educated at St. John's College, Cambridge, and in 1877 was principal of University College, Bristol. In 1883-4 he was lecturer at Balliol College, Oxford, and has been a member of various public boards. He has published: 'Economics of Industry' (1879); 'Principles of Economics' (1890); 'Elements of Economics' (1891); etc.

Marshall, Edward, American journalist: b. Enfield Centre, N. Y., 31 May 1868. He was educated in the public schools at Rochester and entered journalism in New York city, where he conducted an editorial crusade against the conditions existing in tenement buildings. He has been connected with leading New York newspapers and was special correspondent during the Spanish-American war. He has published 'The Rough Riders.'

Marshall, Emma Martin, English novelist: b. North Repps, near Cromer, Norfolk, 29 Sept. 1830; d. Clifton, near Bristol, 4 May 1899. She was married to H. G. Marshall in 1851, and her life thereafter was mainly spent in the cathedral towns of Wells, Exeter, Gloucester, and Bristol. She wrote more than 100 volumes, nearly all of them stories intended mainly, though not entirely, for young people. In spite of their number the even excellence of the tales is remarkable, and they may be called historical pictures

rather than historical tales. Her plan was to introduce into each story several historical personages, as secondary characters, the principal figures being imaginary. Her books have had a wide reading in the United States and still continue popular. Among them are: 'Under Salisbury Spire' (1889); 'In the East Country with Sir Thomas Browne'; 'Haunts of Ancient Peace'; 'In the Choir of Westminster Abbey in the Time of Henry Purcell' (1897); 'Under the Dome of St. Paul's' (1898). Consult: B. Marshall, 'Life of Emma Marshall' (1900).

Marshall, Henry Rutgers, American author and architect: b. New York city 22 July 1852. He was graduated at Columbia in 1873, and in 1878 entered practice as an architect. In 1902 he was appointed a member of the Art Commission of the City of New York. Besides contributions to literary, philosophical, and psychological periodicals, he wrote: 'Pain, Pleasure, and Aesthetics' (1894); 'Æsthetic Principles' (1895); and 'Instinct and Reason' (1898).

Marshall, Humphrey, American botanist: b. West Bradford (the present Marshallton), Pa., 10 Oct. 1722; d. there 5 Nov. 1801. He followed the stonemason's trade, but devoted his leisure to astronomy, building a small private observatory, and to natural history. He began the collection and cultivation of the more interesting indigenous plants, and in 1773 established the Marshallton botanical garden, where were assembled trees and herbaceous plants of the United States. For years he was treasurer of Chester County, Pa., and in 1786 he was elected to the American Philosophical Society. His 'Arboretum Americanum,' described as 'an Alphabetical Catalogue of Forest Trees and Shrubs, Natives of the American United States' (1785), was translated into several European languages.

Marshall, Humphrey, American politician: b. Westmoreland County, Va., 1756; d. near Frankfort, Ky., 1 July 1841. He joined the Continental army at the outbreak of the Revolution, became captain of Virginia cavalry (1778), in 1780 established himself on a Kentucky plantation, opposed the separation of Kentucky from Virginia, and as a delegate to the Danville convention of 1787 was prominent in defeating the measure. He was also a delegate to the Virginia convention that ratified the Constitution of the United States, and in 1793 was a representative from Woodford County in the Kentucky legislature, where he declared his opposition to the plans for raising in Kentucky troops under General George Rogers Clark for an attack on the Spanish settlements near the mouth of the Mississippi River. From 7 Dec. 1795 to 3 March 1801 he was a Federalist senator in the Congress of the United States, and in 1806 was active in denunciation of Aaron Burr. He represented Franklin County in the Kentucky legislature in 1807-9, and had a dispute with Henry Clay which resulted in a duel in which Clay received a slight wound. He sat again for Franklin County in 1823. He published the first 'History of Kentucky' (1812; rev. ed. 1824).

Marshall, Humphrey, American soldier: b. Frankfort, Ky., 13 Jan. 1812; d. Louisville, Ky., 28 March 1872. He was graduated from the United States Military Academy in 1832, entered the mounted rangers, served in the Black Hawk

MARSHALL

war (1832), and resigned from the army 30 April 1833. Admitted to the bar in 1833, he practised in Frankfort (1833-4) and Louisville (1834-6), became a lieutenant-colonel of Kentucky militia in 1841, and raised for the Mexican War the first regiment of Kentucky cavalry, of which he was made colonel 9 June 1846. He fought at Buena Vista (22-3 Feb. 1847). From 3 Dec. 1849 to 4 Aug. 1852 he served as a Whig in the 31st and 32d Congresses, in 1852-4 was minister plenipotentiary to China, and from 3 Dec. 1855 to 3 March 1859, was again in Congress, this time as an American, or Know-Nothing. In 1861 he was commissioned a brigadier-general in the Confederate army, with command of the Army of Eastern Kentucky. On 10 Jan. 1862 he was defeated by General Garfield at Middle Creek (Floyd County) in one of the most important of the minor battles of the Civil War. In May 1862 he surprised General J. D. Cox at Princeton, Va., and was thus of much service to Lee through the relief of the Lynchburg and Knoxville railway. Having resigned his commission in 1862, he represented Kentucky in the congress of the Confederate States (1863-5). From 1867 he practised law with much success at Louisville.

Marshall, John, Chief Justice of the United States: b. Germantown (now Midland), Fauquier County, Va., 24 Sept. 1755; d. Philadelphia, 6 July 1835. He was the eldest son of Colonel Thomas Marshall of Westmoreland County, Va., a distinguished officer in the French War and in the War of Independence, and of Mary Keith a member of the well known Randolph family. Thomas Marshall removed from Westmoreland County to Fauquier soon after his marriage; this community was sparsely settled and the educational advantages which he could give his children were meager, consequently he became their earliest teacher and succeeded in imbuing them with his own love of literature and of history. For two years John Marshall had, as tutor, James Thompson of Scotland and he was sent for one year to the academy of the Messrs. Campbell of Westmoreland County, where James Monroe was also a pupil. He had no college training except a few lectures on law and natural philosophy at William and Mary in 1779. He was always fond of field sports and excelled in running, leaping and quoit throwing. He loved the free natural life of the country, and his long tramps through the woods around his father's home, Oak Hill, together with his athletic exercises gave him great strength and agility. At 18 he began the study of law but soon left his studies to enter the Revolutionary army. He was active in endeavoring to enlist men for the service and helped to form and drill a company of volunteers. As a member of his father's regiment he took part in the battle of Great Bridge where he displayed signal valor. In 1776 he became a lieutenant in the 11th Virginia, and the next year was made captain. He served in Virginia, New Jersey, Pennsylvania and New York, always displaying great courage and valor and a cheerful acceptance of hardships and privations. This experience was of untold value to Marshall, it broadened his views and quickened his insight in governmental questions. As he says, he entered the army a Virginian and left it an American. In 1780 during a period of military inactivity he attended a course of law

lectures at William and Mary and in 1781, after leaving the army was granted a license and began the practice of law in Fauquier County. The next year he was elected to the Virginia Assembly, and shortly afterward was made a member of the Executive Council. He served his State as legislator during eight sessions. In 1784, although he had then removed his residence to Richmond, he was again elected delegate from Fauquier County, and in 1787 served as member from the County of Henrico. When the city of Richmond was granted a representative in the legislature Marshall had the honor of this office which he held from 1788 to 1791. He was also a member of the Federal Convention which met in 1788 to discuss the ratification of the Constitution of the United States, and it was largely due to his convincing arguments that ratification was carried, as the question was hotly debated and the anti-Constitution party had able and determined representatives. For several years he held no public office and devoted himself entirely to his extensive law practice, but in 1795 was again elected to the legislature. During this session he defended the unpopular "Jay Treaty" with England, and by his overwhelming arguments completely refuted the theory of his opponents that the Executive has no power to negotiate a commercial treaty. Marshall's attitude during his service as legislator toward all questions concerning Federal power demonstrated his increasing belief that a strong central government is necessary to real efficiency. In 1783 he had married Mary Ambler, daughter of Jacqueline Ambler, Treasurer of the State, and soon after his marriage made his permanent home in Richmond. The honors bestowed on him testify to the esteem in which he was held by the State and by the Nation. He refused the Attorney-generalship and the ministry to France, but in 1789 accepted the office of special envoy to France with Charles Cotesworth Pinckney and Elbridge Gerry. This mission related to the indignities which the French had offered the American navy and attempted to adjust the commercial relations between the two countries. It failed on account of the arrogant attitude of France, but "Marshall's dignified correspondence added greatly to the prestige of America," and on his return he was welcomed with many evidences of approbation from his grateful countrymen. Yielding to the earnest solicitation of Washington he became a candidate for Congress and was elected a member of that body in 1798. In Congress he was the leader of the Administration party and the greatest debater in the house on all constitutional matters. In one of his most noted speeches he defended the action of President Adams in the case of Jonathan Robbins and proved conclusively that this case was a question of executive and not of judicial cognizance. In 1800 he was made secretary of state, and in 1801 appointed Chief Justice of the United States, which office he held until his death in 1835. In 1820 he, like Ex-President Madison and James Monroe, was a member of the Virginia Convention which met to alter the State Constitution, and by his wisdom and moderation did much to prevent radical changes and to thwart the attempts of politicians against the independence of the judiciary. In 1831 his health, hitherto unusually vigorous, began to fail; he underwent a severe surgical operation in Philadelphia and was seemingly restored, but

JOHN MARSHALL,
CHIEF JUSTICE U. S. SUPREME COURT.

MARSHALL

the death of his wife was a great shock and a return of the disease in 1835 proved fatal. He died in Philadelphia, whither he had gone for medical relief, and was buried by the side of his wife in the New-Burying-Ground, now Shock-hoe Hill Cemetery, Richmond. The sorrow over the country was deep and widespread, even his bitterest political enemies mourned for the kindly, upright man.

Though somewhat ungainly, Marshall was always dignified in appearance; his tall, loosely-jointed figure gave an impression of freedom, while his finely shaped head and strong penetrating eyes bespoke intelligence and power. Directness and simplicity were his dominant characteristics. He was free from any display of pomp, air of office or studied effect. His unfeigned good humor, his benignity, his respect for women, his devotion to wife and family and his well-known reverence for religion made him loved and admired even by those who heartily disliked his political opinions. As chief justice for more than 30 years he rendered numerous decisions which were of prime importance to a nation in process of formation. The faculty which made Marshall invaluable as a jurist was his power of going directly to the core of any matter. No subtleties, no outside issue confused him, his analysis was unerring, his logic incontrovertible; he cared nothing for the graces of rhetoric and made no appeal to the emotions; his power lay in his deep conviction and in his illuminating and progressive argument. At a period when the powers of the Constitution were ill-defined, when our government was experimental, Marshall's decisions in Constitutional and international cases were invaluable factors in forming a well-organized Federal government. "He made the Constitution live, he imparted to it the breath of immortality, and its vigorous life at the present hour is due mainly to the wise interpretation he gave to its provisions during his long term of office." Marshall was the author of numerous reports and papers, of a history of the colonies, and of a 'Life of Washington,' a book of small literary merit, but containing a mass of valuable authentic information. Consult: Cooley, 'Constitutional History of the United States' (1889); Margruder, 'John Marshall' (1885); Thayer, 'John Marshall' in 'Beacon Biographies' series (1901).

EMILIE W. McVEA,
Of the University of Tennessee.

Marshall, Ill., city, county-seat of Clark County; on the Vandalia Line and the Cleveland, C., C., & St. L. R.R.'s; about 122 miles east by south of Springfield and 15 miles west by south of Terre Haute, Ind. It is in an agricultural and stock-raising region. Its chief manufactures are flour, woolen goods, condensed milk and other dairy products, and lumber. It has considerable trade in farm products, live-stock, and condensed milk. Pop. (1900) 2,077.

Marshall, Mich., city, county-seat of Calhoun County; on the Kalamazoo River, and on the Michigan C. and on the Cincinnati, J. & M. R.R.'s; about 38 miles south by west of Lansing and 100 miles west of Detroit. The surrounding country is devoted chiefly to agriculture. The principal manufactures are school and church furniture, hot-air furnaces, patent

medicines, breakfast food, flour, bicycles, wagons and carriages, windmills, bath-tubs, electrical supplies, caskets, and agricultural implements. Marble and granite works employ a number of men. The grounds of the County Agricultural Society are located in Marshall. The electric-light plant and the waterworks are owned and operated by the city. Pop. (1900) 4,370.

Marshall, Minn., city, county-seat of Lyon County; on the Redwood River, and on the Chicago & N. W. and the Great N. R.R.'s; about 160 miles west by south of Saint Paul. It is in an agricultural section in which wheat is the principal product. The industrial establishments are a flour mill, grain elevators, and a creamery. The principal buildings are the county courthouse and the jail. The educational institutions are the public and parish schools, Holy Redeemer Academy, and a public library. Pop. (1900) 2,088.

Marshall, Mo., city, county-seat of Saline County; on the Missouri P. and the Chicago & A. R.R.'s; about 80 miles east of Kansas City. It was settled in 1839 by people from Virginia and Kentucky, and was incorporated as a city in 1866. It is situated in an agricultural region; in the vicinity are valuable deposits of coal and salt, and nearby are stone quarries. The manufactures are lumber, tile and brick, flour, canned goods, creamery products, wagons and carriages. It is the seat of the State Institution for Feeble Minded and Epileptics; the Missouri Valley College (Cumberland Presbyterian), established in 1889; San Saviour Academy (R. C.). There are eight churches and public and parish schools. Marshall has four banks with a combined capital of \$300,000. The government is vested in a mayor, city marshal, and a council of six members, who are elected every two years. Pop. (1890) 4,297; (1900) 5,086.

O. P. STURM,
Editor of 'Index.'

Marshall, Texas, county-seat of Harrison County, is situated about 14 miles north of Sabine River, 40 miles west of Shreveport and 67 miles south of Texarkana. The city was founded in the year 1840. Marshall is situated in the midst of a fertile agricultural region which has heretofore engaged mostly in cotton raising, but recent developments show that this section is well adapted to truck growing and the raising of fruits, especially peaches, and large orchards are being planted. The city is largely supported, also, by lumber interests, there being large areas of pine timber contiguous to the city, which is rapidly being marketed. The land from which the timber is taken is quickly occupied for agricultural and orchard purposes, some orchards containing as high as 6,000 acres. Stock raising is also carried on, and the city receives considerable support from this source. The Texas & Pacific R.R. runs through the city, west to El Paso, north to Texarkana, and southeast to Shreveport and New Orleans. The Texas Southern R.R. has its terminus, at present, at Marshall, but will be pushed farther south. The shops of the Texas & Pacific R.R., located at Marshall, are the finest to be found anywhere in the southwest. Locomotives and all kinds of rolling stock are manufactured. These shops employ 900 men and have a local pay-roll of \$50,000 a month. The local shops and general offices of the Texas Southern R.R.

MARSHALL ISLANDS — MARSHMAN

are also located in Marshall. Marshall has, in addition to the railroad shops, a 50-ton cottonseed oil mill; a large compress which pressed 45,000 bales of cotton last year. The Marshall car-wheel and foundry plant, located here, is the largest in the southwest, and employs 325 men. There are, also, two wagon factories, a soda-water apparatus factory, and various other minor manufactures. The city has installed complete sewerage and waterworks plants.

Religiously, all the various denominations are represented, and have commodious houses of worship. The school system of the city is run on the latest and best methods, having three ward schools and a centrally located high school, well equipped with teachers and appliances. The public free schools are open nine months in the year. The total value of the city school property is \$100,000. There are, also, a number of private schools. There are three Catholic schools in the city—one for girls and one for boys, and an industrial school for boys. In the city are also located Wiley University and Bishop College, institutions for the education of the negroes; the former with 493 and the latter with 500 students annually. The property of the former is valued at \$65,000, and the latter at \$150,000.

The city has two national banks, the First National, capital \$75,000, and the Marshall National, capital \$100,000. The Messenger Publishing Co., of Marshall, issues morning and evening daily papers, also a weekly paper and 'The Messenger Monthly Magazine.' Marshall and vicinity is noted for the medicinal properties of its many springs and wells, and many people annually, especially during the summer season, visit these places as health resorts. Hartley's Well, situated within the corporate limits of the city of Marshall, is said to have wonderful curative qualities. Hynson's Iron Mountain Springs, situated five miles west, and the Rosborough Springs, situated nine miles south, are also noted for their health-giving qualities. Pop. (1904) 12,000.

H. T. LYTLETON,
Marshall, Texas.

Marshall Islands, Polynesia, an archipelago in the western Pacific Ocean, belonging to Germany since 1885. They are situated eastward of the Carolines and northward of the Gilbert Islands, and are intersected by the parallel of lat. 10° N. The group consists of two parallel chains, the Ratak group of 15 islands in the east, and the Ralik group of 18 islands in the west; total area, 154 square miles. The islands rise nowhere more than 10 feet above the sea, and are not very fertile, the chief vegetable productions being the cocoanut palm, the breadfruit, and the pandanus. The natives are of a brown color. They are skilful in weaving mats, and in the construction of large canoes. Copra is the only commercial product. Pop. (1901) 15,063.

Mar'shalltown, Iowa, city, county-seat; on the Chicago & N. W., the Chicago G. W., and the Iowa C. R.R.'s; about 70 miles northeast of Des Moines. It was settled in 1860 and in 1863 was incorporated as a town. In 1868 it received a charter as a city of the second class. It is an agricultural and stock-raising region in which wheat and corn are the chief farm products. Some of the industrial plants are

flour-mills, grain elevators, glucose factories, meat-packing plants, furniture factories, carriage works, foundry and machine shops, and bottling works. It has the Iowa State Soldiers' Home, Saint Mary's Institute (R. C.), and public and parish schools.

The city is governed by an administration elected under a general law of the State, passed in 1893, which provides for a mayor, a unicameral council, and a school board to be chosen by popular vote. The electric-light plant and the waterworks are owned and operated by the city. Pop. (1890) 8,914; (1900) 11,544.

Marshalsea, mār'shal-sē, a jail in London, attached to the Marshalsea Court, originally established under the earl-marshal of England for the trial of servants of the royal household. Later it was used as a prison for debtors and defaulters, as well as persons convicted of piracy on the high seas. It stood near the church of St. George, Southwark, and existed in the reign of Edward III. It was abolished in 1849. The Marshalsea will be longest remembered as the home of 'Little Dorrit.' Dickens' father was for some time an inmate of the Marshalsea, and in 'Little Dorrit' the novelist has given us a vivid picture of the life of a debtor and his family in this prison.

Marshbunker, Marsbunker, etc. See MOSSBUNKER.

Marshfield, Wis., city in Wood County, on the Wisconsin C., the Chicago, St. P., M. & O., and the Chicago & N. W. R.R.'s; almost in the centre of the State, about 190 miles northwest of Milwaukee. It was settled in 1871 by Louis Rivers, and was incorporated as a village in 1875, and chartered as a city in 1883. It is situated in an agricultural region and near extensive forests. The industries of the city are chiefly connected with manufacturing and farming. The chief industrial establishments are a furniture factory which employs 300 persons; veneer factory, 125; bed and mattress factory, 40; lumber-mills, 50; brick yards, 25; cooperage and excelsior factory, 40; other establishments employing about 30 persons. The city has a fine city-hall, a public library, seven churches, a high school, four public and two parish schools. The two banks have a combined capital of \$800,000. The government is vested in a mayor and 12 aldermen, who are elected every two years. About two thirds of the inhabitants are of German descent. Pop. (1890) 3,450; (1900) 5,240.

ADAM PAULUS,
Editor of 'News.'

Marshman, Joshua, English Baptist missionary and Orientalist: b. Westbury, Leigh, Wiltshire, 20 April 1768; d. Serampore, India, 5 Dec. 1837. He was, like his father, a weaver, but had an insatiable thirst for learning, and always kept a book on his loom. Thus he fitted himself to teach in a Baptist school in Bristol; and thence, in 1799, he went to Serampore as a Baptist missionary, and there founded, in 1810, a missionary college. He was an able linguist, and published: 'The Works of Confucius, containing the Original Text' (1809); 'Clavis Sinica' (1814); a Chinese version of the Bible; etc. He co-operated with Carey in the preparation of Telegu version of the Bible, a Bengali-English dictionary, and a Sanskrit grammar. Consult Carey, 'Marshman and Ward' (1864).

Marston Moor, England, in Yorkshire, is celebrated for the defeat there in 1644 of the royal forces under Prince Rupert, by the Parliamentary troops under Fairfax and Cromwell.

Marsupial Frog, any of several small tree frogs (*Hylidæ*) of the South American genus *Nototrema*, which incubate their eggs in brood-pouches formed by infoldings of the skin on the back of the female. The eggs are few, of large size, and abundantly provided with food-yolk, and the young sometimes remain in the pouches after hatching until they have completed their metamorphosis and attained considerable growth; but the species vary in this respect. In one case the opening is a longitudinal slit along the middle of the back, with a brood-pouch on each side; but in the other species the double pouch opens cross-ways, near the caudal extremity of the body, and may be closed by a sphincter muscle. About half a dozen species are catalogued, all natives of the forests of tropical America, and none is common or thoroughly well known. Gadow ('*Amphibia and Reptiles*,' 1901) concedes that the best account of them is still that of Weinland in '*Archive für Anatomie und Physiologie*' for 1854.

Marsupial Mole, a small burrowing marsupial of southern Australia (*Notoryctes f. -hlops*), called "urquumata" by the natives, which has a remarkable similarity to a true mole in appearance (except its reddish color), adaptations of structure to an underground life, and habits. It feeds upon ants and other insects, and often emerges and travels above ground, though the front feet have been so transformed into digging organs as to make them of little service for walking. It represents a family (*Notoryctidæ*) first described by Stirling in the '*Transactions*' of the Royal Society of South Australia for 1891.

Marsupialia, the marsupial mammals, a group ranked as an order, yet embracing the whole of the superior group *Metatheria* or *Didelphia*, as it has been variously named. The latest investigations, however, tend to invalidate the distinctions upon which these groups were formerly sharply separated from the higher mammals, and to cause the marsupials to be regarded only as an order of *Eutheria* (q.v.), now distinguished chiefly by their extremely local distribution and degenerate non-placental type of reproduction. Their origin was extremely ancient, and its sources are not known; but the group appears to have arisen in Mesozoic times among the earliest of mammalian forms, and to have begun, even before the advent of the Tertiary period, a course of special modification and degeneration, especially in the line which has survived to the present. The former belief that the marsupials stood in the direct line of ancestry of mammals generally, which were thus considered as modified and diversified offshoots from this stock, is no longer held: on the contrary, the marsupials are regarded as a branch from some very early generalized stock, if not a group of independent origin. It is noteworthy, says Woodward ('*Vertebrate Palæontology*,' 1898), that the earliest known complete mammalian skeletons, which pass upward by insensible gradations into undoubted *Eutheria*, are scarcely distinguishable from the skeletons of the more generalized existing mar-

supials (for example, *Thylacinus*). In the later Mesozoic Age the marsupials were apparently scattered over all the land-area of that time, as their remains have been discovered in many parts of both hemispheres; but even previous to the Eocene epoch they had disappeared entirely from north of the equator. From the first they are divisible into the two branches or sub-orders of *Polyprotodontia* and *Diprotodontia*. The former, characterized by numerous small incisor teeth, includes a majority of the most ancient forms, and such modern groups as the opossums and desyures; while the latter, characterized by only about six upper incisors and two, much enlarged, lower incisors, contain, besides some ancient forms, the majority of modern representations of the order, as the kangaroos, phalangers, wombats, etc.

The marsupials take their name from the ventral pouch of skin, covering the mammary glands, in which the young are nourished or protected in most families, and which is indicative of the peculiar method of reproduction characteristic of the order, and for the support of which two bones (the epipubic bones), not present in higher mammals, project forward from the pelvis. The internal organs of reproduction are double, the two oviducts not uniting into a single uterus or vagina, although the separation of the two parts is often imperfect; hence the term *Didelphia* (q.v.). The testes of the male are suspended in a scrotum in front of the penis, the *glans* of which is often double. As a rule no allantoic placenta is present, but there is reason to suppose that the primitive marsupials were placental, and rudiments of this structure persist in the existing Australian bandicoots,—a fact which invalidates the former prime distinction made between the marsupials and higher *Eutheria*.

The young are dropped from the mother's womb as minute, undeveloped fetuses, those of the largest kangaroos being not half as large as mice when born. These larvæ (for they are that) are then taken by the lips of the mother and placed, one by one, within her ventral pouch, where each is attached to one of her teats, where it clings by means of its temporary sucking-mouth, and is nourished by the milk which oozes or is pressed down its throat. They remain there a length of time varying with the size of the species, until they have grown to an advanced stage of development, when they gradually emerge; but for a long time afterward return to the mother's pouch for refreshment, rest, or safety when alarmed. The pouch varies in its capacity and completeness, in some families being quite absent, so that the young are shielded only by the long hair upon the mother's belly.

While this strange method of reproduction is the most prominent peculiarity of the marsupials, they differ from other orders of mammals in several anatomical features, such as the simplicity of the brain, in which the cerebellum is completely exposed, and the tendency to separation of bones of the skeleton, usually solidly ankylosed in other mammals.

Since early Tertiary times marsupials have been confined to South America and the Australasian region, with the single exception of the few North American opossums (q.v.). This family (*Didelphyidæ*) is restricted to the western hemisphere, and alone remains of the large number

of Tertiary forms once prevalent in South America, save a single Patagonian diprotodont, the opossum-rat (q.v.). The home of the group, then, is Australia, Tasmania, and the Papuan group, where about 125 species are known; and the race seems to have survived in that insular region owing to the absence of destructive enemies, for most of them are almost defenseless vegetable feeders. They have, however, developed into a great variety of forms under the influence of varying conditions and long competition, and present a most curious parallel to the diversities observable among the higher and more widely diffused mammalia. Some have large size, go in herds, and occupy grassy plains; others are smaller, more agile, and confined to mountainous districts. Others are still smaller, burrow, and feed upon roots, or resemble little terrestrial rodents in appearance and habits; while many forms dwell altogether in trees, and often simulate squirrels of various kinds. In another direction have been evolved a variety of predatory marsupials, whose needs have developed bodies, teeth, and powers resembling those of wolves or bears, and which are wholly flesh-eaters. There is, in fact, hardly a group of mammals which does not find a counterpart among the marsupials,—even the moles and shrews.

The classification of the order divides it into 10 or 12 well-defined families, some of which are wholly extinct, as follows:

POLYPROTODONTIA:

Doubtful primitive forms,—*Triconodon*, *Amphitherium*, etc.

Didelphyidae.—Opossums (q.v.).

Dasyuridae.—Dasyures, Thylacines, etc. (qq.v.).

Peramelidae.—Bandicoots (q.v.).

Notoryctidae.—Marsupial Moles (q.v.).

DIPROTODONTIA:

Epanorthidae; *Abderitidae*, etc.—Fossil in the Miocene strata of Patagonia; but surviving in *Canolestes* (q.v.).

Phalangeridae.—Phalangiers (q.v.).

Diprotodontidae.—Extinct gigantic phalangiers.

Phascolomyidae.—Wombats (q.v.).

Macropodidae.—Kangaroos (q.v.).

Consult: Beddard, 'Mammalia' (1901); Thomas, 'British Museum Catalogue of Marsupialia,' etc. (1888); Gould, 'Mammals of Australia' (1863); and scientific works on Australia, especially those of Waterhouse, Añalo, and Lydekker.

Marsyas, mār'si-as, mythological son of Olympos, Ægrus, or Hyagnis. Athena, having seen the reflection of herself in the water, had thrown away the flute which she had invented, displeased because it disfigured the countenance in playing, and had pronounced the severest maledictions against any one who should take it up. Marsyas accidentally found this instrument, on which he soon acquired such skill that he dared to challenge Apollo to a contest, the conditions of which were that the victor should do what he pleased with the vanquished. The Muses, or according to others the Nysæans, were invited to be the umpires. The Muses decided in favor of Apollo, who put to death his rash competitor by binding him to a tree and flaying him alive. In this way was the curse of Athena accomplished.

Martel', Charles. See CHARLES MARTEL.

Martello Towers, so called by corruption from *Mortella*, in Corsica, where a strong tower maintained a determined resistance to a superior English force in 1794. In consequence of the great strength exhibited by this fort the British government erected a number of similar towers round the coast of Great Britain, and especially on the Kentish coast, as a defense against the threatened invasion from France. They are circular, with walls of great thickness, and roofs bomb-proof, and consist of two stories, the lower for the reception of stores, and the upper for the casement of troops. One traversing gun was mounted upon each, in working which the men were secured by the lofty parapet. The ordinary guard was from six to twelve men. Martello towers having come to be considered a failure, were in many places dismantled, but some have received a new and more powerful armament, or have been adapted to the use of the coast guard, or revenue officers. In some instances they are rented to private individuals. Martello towers are still to be found in New Brunswick and Nova Scotia. There are also several on the Gulf of Mexico and one still remains at Kingston, Canada.

Mart'en, the name of several fur-bearing animals of the weasel family (*Mustelidae*), which are mainly arboreal in their habits, and do not change their color to white in winter. The common European marten (*Martes*, or *Mustela*, *foina*), or "fou'mart," is found in Europe generally, as also is the pine marten (*M. abietum*), although the latter is rarer in Britain. The former breeds in hollow trees, and produces from three to seven young at a birth. They feed on the smaller wild mammals, such as rats, mice, etc., but also attack birds and devour eggs. They are said to be fond of honey, and even to eat fruits and grain. The pine marten occurs chiefly in North America and in the northern parts of Asia. It is of smaller size than the common marten, has a finer fur, and possesses a yellowish mark on the throat. It burrows in the ground, carries the young about six weeks, and brings forth from four to seven in a litter about the end of April. The fur is used for trimmings, and upward of 100,000 of these animals are annually hunted and killed in the fur countries, yet this marten remains fairly numerous. The famous sable marten (*M. zibellina*), which furnishes the highly valuable sable fur, is nearly allied to the pine marten. It inhabits Siberia, and vast numbers of this species are killed annually for the sake of the fur. The pursuit of these animals is described as a task involving much difficulty, discomfort, and even peril. The American sable is furnished by the *M. americana*, and Pennant's marten (*M. canadensis*), or the fisher, pekan or black cat, as it is popularly called among northern hunters, is another well-known species. Both these last named are now almost restricted to the remote Canadian woods, although formerly numerous in the northern part of the United States. Various opinions are held by naturalists as to the specific distinction of several of the species above named, which furnish few very definite characters for separation from one another. Consult Coues, 'Fur-Bearing Animals' (1877).

MARSUPIALS.

1. Sugar Squirrel (*Belideus sciurues*).
2. Mouse-phalanger (*Tarsipes rostratus*).
3. Wombats (*Phascolomys wombat*).

4. Tasmanian Wolf (*Thylacinus cynocephalus*).
5. American Opossum (*Didelphys virginiana*).
6. Koala (*Phascolarctos cinereus*).

MARTHA'S VINEYARD—MARTIAL LAW

Martha's Vineyard, Mass., an island off the southern coast, in the County of Dukes. It is separated from the mainland by Nantucket and Vineyard Sounds, from Nantucket Island by Hukeget Channel, and from Elizabeth Islands by Vineyard Sound. It is about 20 miles long and 11 miles across the widest part. The northern coast is high and rocky, with a few indentations, the largest of which is Vineyard Haven. The southern coast is low and irregular, with sand bars and shallow lagoons. On the southwest is Gay Head, 200 feet above the water. A lighthouse is on Gay Head Point. Edgarton, the county-seat, is the principal town on the island. Bartholomew Gosnold discovered and named the island in 1602. The Indians, who then occupied the place, were quiet and friendly, and all became Christians. They remained loyal to the whites even during King Philip's War. The island is a favorite summer resort; annual camp-meetings and summer schools have been held here for a number of years. Pop. (1900) 4,561.

Martí, José Julián, ho-sā' hoo-lē-ān' mār'tē, Cuban author and patriot: b. Havana 28 Jan. 1853; d. Dos Rios, Cuba, 19 May 1895. He studied in Havana, was sent to the quarries while only a boy as a political suspect, then went to Spain, where in Madrid and Saragossa he studied for the bar and made himself famous for his liberal views, and on his return to America was professor in the University of Guatemala, whence he came to New York city as consul for Uruguay, Paraguay, and Argentina. In 1894 he attempted to land armed men in Cuba, but was intercepted in Florida; in the next year he succeeded in landing, joined Gomez, and was killed in a skirmish with the Spanish at Dos Rios. Martí founded the Cuban organ of independence in New York city, 'La Patria,' was a poet, and wrote a Spanish translation of Helen Hunt Jackson's 'Ramona' (1888).

Martial, mār'shī-al (MARCUS VALERIUS MARTIALIS), the world's greatest writer of epigrammatic poetry, was born in Bilbilis, Spain, 1 March of one of the years 38 to 41 A.D., and died probably between 102 and 104 A.D. Like his literary friends, the Senecas, Lucan and Quintilian, who also were of Spanish birth, Martial in his writings was thoroughly Roman, and indeed has left us our most valuable picture of contemporary Rome. A Fronto and Flacilla, whom he mentions, may have been his parents, but we know nothing of their origin or station. The grammatical and rhetorical training which his parents secured for him perhaps at Tarraco or Corduba, he half-seriously disparaged as being of no financial advantage, but it was really to his pen that he owed, at least indirectly, his support through life. For, although he was apparently fully equipped for practice at the bar, the profession of an advocate was too exacting to be attractive. On his arrival in Rome, perhaps in 64 A.D., powerful friends launched him on a literary career which rapidly carried his fame even to the limits of the empire. But success as a poet brought him no contentment, since in return for the money, food, clothing, etc., which by flattery and begging he got from imperial courtiers and other men and women of wealth, he had daily to perform social duties that were highly irksome to his indolent nature. From the patron's reception at dawn to

the end of the latest dinner, he had to dance attendance with wit that should never fail. We find him living at first in humble lodgings on the Quirinal, later in a house of his own on the same hill. A barren farm near Nomentum was his usual refuge from the cares and noises of the capital, but he sometimes made long journeys in Italy, often visiting the country houses of his friends. To his poetical and social talents he also owed political favors from Titus and Domitian. A tribuneship gave him membership in the equestrian order, but probably not the fortune of a knight. He likewise received the coveted privileges to which a father of three children was entitled, the *ius trium liberorum*, though unearned; for the references that have given rise to the theories that he was married from one to three times are not of personal application. It is probable that even Marcella was no more than his patroness. When disgust at the client's life in Rome led him in 98 to return to Bilbilis, this Spanish lady gave him a fine estate. A longing soon seized him, however, to be back in Rome with all its inspirations, a longing never to be gratified; Pliny the Younger, who had helped Martial with a gift of money on his departure from Rome, records the poet's death in Spain. Besides those already named, Juvenal and Silius Italicus should be mentioned as Martial's friends. Noteworthy among contemporaries whose names do not appear in his poems are Tacitus and Statius. The former could have had little sympathy with his character, the latter was no doubt his rival in literary mendicancy. We have 1,575 of Martial's poems. More than half of these are of four lines or less. His earliest book published in 80 contains epigrams describing shows given by the emperor. Then followed books XIII. and XIV. made up of two-line inscriptions for presents at the Saturnalia. The other books (I.—XII.), containing many poems which we should not call epigrams at all, appeared at varying intervals in the period 85–101. Martial's influence in his chosen field has never ceased. A remarkable number of the best epigrams in modern languages are merely adaptations or translations of his poems. His personal character has received general condemnation. Obscenity and servile flattery are the main charges. But in judging even the insincere language that he uses in speaking of the tyrant Domitian we must remember that it went only a step beyond the requirements of formal court etiquette. Kindly critics find in Martial some good points, his modest valuation of his own work, his freedom from envy, his scorn of all hypocrisy, his steady resistance to all temptations to use his powerful weapon of satire in either an unjust or unkind spirit, his tender love of children, humane treatment of slaves and above all his deeply affectionate attachment to his friends.

Literature.—The best text edition of his poems is that of W. M. Lindsay, Oxford, Clarendon Press. The German annotated edition of Friedlaender is invaluable. The only complete prose translation in English, that in the Bohn series, is poor.

WALTON BROOKS MCDANIEL,
Assistant Professor of Latin, University of Pennsylvania.

Martial Law, a law that supersedes municipal law, or State law, yet is not a military law.

MARTIN

When in time of extreme peril to the State, either from without or from within, the general safety cannot be trusted to the ordinary administration, or the public welfare demands the adoption and execution of extraordinary measures, it may become necessary to declare the existence of martial law. This is, indeed, no law at all in its ordinary sense; it is in fact the abrogation of it. That which is done under martial law has not an immediate constitutional or legislative sanction, as the military or the statute law, for example, has. Yet remotely and indirectly martial law expresses the will of the people. The Supreme Court of the United States has held that a State legislature may proclaim its existence whenever the public safety demands it; and the Constitution, by implication at least, also permits its proclamation by that clause which provides that the privileges of the writ of *habeas corpus* shall not be suspended, unless when, in cases of rebellion or invasion, their suspension is essential to the general welfare. See also COURT-MARTIAL; LAW; MILITARY.

Martin, Saint, of Tours: b. about 316; d. about 400. He attended the catechetical school at Pavia. His father was a military tribune, and compelled him in his 16th year to take up arms. He is said to have early escaped from his father and received instruction in a Christian Church. He served under Constantius and Julian, and went to Gaul, where he appeared as the model of all virtue. Among other acts he divided his cloak with a poor man whom he met at the gates of Amiens (Ambianum). The legend says that Christ appeared to him in the following night covered with the half of this cloak. Soon after this vision Martin was baptized, in 337. After living many years in retirement he made a visit to his native place, during which he converted his mother, and opposed with zeal the Arians who prevailed in Illyria. For this he was scourged from the country, on which occasion he manifested the firmness of a martyr. He now established a monastery in Milan, but when he found himself again exposed to persecution took refuge on the Island of Gallinaria, in the Ligurian Sea. He next settled at Poitiers, where he assembled a number of monks, and is said to have wrought many miracles. In the year 375 (according to others 371 or 374) the bishopric of Tours was conferred on him against his will. In order to withdraw himself from the world he built the famous convent of Marmoutiers, between the river Loire and a steep rock. This is regarded as the oldest abbey of France.

Martin, the name of five popes of the Catholic Church, as follows:

Martin I., Saint: b. Todi, Tuscany; d. Cherson, Crimea, 16 Sept. 655. He was elected pope in 649, succeeding Theodore I. He summoned the first Lateran Council at which he caused the doctrine of two wills and operations in Christ to be affirmed. The Emperor Constant II. upholding the doctrines which the Council had condemned, took the pope prisoner and brought him to Constantinople on a charge of treason and then banished him to the Crimea. On account of his sufferings he is numbered among the saints. His day is 12 November.

Martin II., or Martinus I.: b. Montefiascone; d. Rome 14 Feb. 884. He was elected pope in 882 after the death of John VIII. While bishop of Caere he had been legate for three popes in their negotiations with the East. To English King Alfred he sent a piece of the wood of the Cross.

Martin III., or Martinus II.: b. Rome; d. 946. He succeeded Stephen VII. in 942 and was greatly esteemed for his learning and nobility of character.

Martin IV. (SIMON DE BRION, sê-môn dê brê-ôn): b. France; d. Perugia 28 March 1285. He succeeded Nicholas III. in 1281, having previously been canon of Tours, and cardinal from 1261. He owed his election in great measure to the influence of Charles of Anjou, whom he supported thereafter and did all in his power to enable that monarch to retain possession of Sicily. In his pontificate occurred the massacre known as 'The Sicilian Vespers.'

Martin V. (OTTONE COLONNA, ôt-tô'nâ kô-lôn'nâ): b. Rome 1363; d. there 20 Feb. 1431. He was elected pope in 1417, after the abdication of Gregory XII., and the deposition of John XXIII. and Benedict XIII., during the Council of Constance. His first act was to promulgate a bull against the Hussites, remarkable from the circumstance that in it the pope seems to recognize the supreme authority of the councils. He was one of the ablest of the popes, and through his efforts unity was finally secured to the Church and peace to Italy. In 1418 he dissolved the Council of Constance, though a number of difficulties were not then adjusted, and dissensions continued in the Church. Benedict XIII. still lived; and at his death, in 1424, a new anti-pope was elected in Clement VIII., who renounced his pretensions in 1429, when he received the bishopric of Minorca as an indemnification.

Martin, Charles Cyril, American civil engineer: b. Springfield, Pa., 30 Aug. 1831; d. Far Rockaway, N. Y., 11 July 1903. He was educated at Rensselaer Polytechnic, Troy. He was engineer in the Brooklyn navy yard during the Civil War; and afterward chief engineer of Prospect Park, Brooklyn; and was appointed John A. Roebling's second assistant in building the Brooklyn Bridge, of which he became chief engineer after Roebling's retirement.

Martin, François Xavier, American jurist: b. Marseilles, France, 17 March 1764; d. New Orleans 11 Dec. 1846. He emigrated to Martinique when 18; later removed to New Berne, N. C.; taught French there and became a printer; studied law, being admitted to the bar about 1789; and in 1792 was requested by the State legislature to compile the British statutes in force before the Revolution. He was himself a member of the Assembly in 1806-7; was judge of the Mississippi Territory in 1809; went to Louisiana in the same capacity in 1810; and in 1813 became attorney-general of the new State of Louisiana. From 1815 until just before his death Martin was a member of the Supreme Court of the State. Although blind for the last 10 of these 31 years, his ability was not impaired, and it is due to him that the law of the State was in some measure evolved from

the tangle of French and Spanish statutes in which he found it. He wrote a 'History of North Carolina' (1829); 'History of Louisiana' (1827), and a version of Pothier on Obligations.

Martin, Helen Faucit, LADY. See FAUCIT, HELEN.

Martin, Henry Austin, American surgeon: b. London 23 July 1824; d. Boston 7 Dec. 1884. He came to the United States at an early age and was graduated from the medical school at Harvard in 1845, when he established a practice in Boston. He served as a surgeon until nearly the close of the Civil War, when he resigned and was brevetted lieutenant-colonel for gallant service. He devoted his attention principally to surgery and to the treatment of smallpox, upon which subject he was a generally recognized authority. He was the originator of many important innovations in the field of surgery and published valuable professional articles in periodicals.

Martin, Homer Dodge, American painter: b. Albany, N. Y., 28 Oct. 1836; d. St. Paul, Minn., 12 Feb. 1897. He was elected a member of the National Academy of Design in 1875; and resided in France in 1882-6. While he was influenced somewhat by the Barbizon School of painters, he developed a style entirely his own, which placed him among the best known of American landscape painters. His works include 'Landscape on the Seine'; 'An Equinoctial Day'; 'Brook in the Woods'; 'In the Adirondacks'; 'Sand Dunes on Lake Ontario'; and 'White Mountains, from Randolph Hill.'

Martin, Josiah, English colonial governor in America: b. probably in Antigua, West Indies, 23 April 1737; d. London, England, July 1786. He rose to the rank of lieutenant-colonel in the British army in 1771, and in the same year was appointed to the royal governorship of North Carolina. He was successful in pacifying the "regulators," many of whom remained zealous Tories; and took a firm and energetic attitude in the maintenance of British authority. But on 24 April 1775 he was compelled to escape to the sloop *Cruiser*, from which on 8 August he issued a prodigiously long proclamation which the Whigs ordered burnt by the hangman. He was with Sir Peter Parker at Charleston (June 1776), and accompanied Cornwallis into North Carolina after the British victory over Gates at Camden; but in March 1781 withdrew to Long Island, and thence went to England.

Martin, Luther, American lawyer: b. New Brunswick, N. J., 9 Feb. 1748; d. New York 10 July 1826. He was graduated from the College of New Jersey (Princeton) in 1766; studied law at Queenstown, Md., was admitted to the Maryland bar in 1771; in 1774 was one of the commissioners appointed to oppose the claims of Great Britain; in 1778 became attorney-general of Maryland; and in 1787 was a delegate from Maryland to the convention that framed the Constitution of the United States. His opposition to the instrument was so strong that, rather than sign it, he left the convention, thus earning from Jefferson the sobriquet of "the Federal bull-dog." In 1804 he defended Samuel Chase (q.v.) in the latter's impeachment trial before the Senate, and in 1805 resigned his attorney-generalship and resumed private practice. He was counsel for Burr in Burr's trial at

Richmond in 1807, in 1814-6 was chief judge of the Baltimore court of oyer and terminer, and in 1818-20 was again attorney-general of Maryland. Among his writings was the series of pamphlets, 'Modern Gratitude' (1801-2). Consult Goddard, 'Luther Martin' (1887).

Martin, Sir Theodore, English lawyer and author: b. Edinburgh 16 Sept. 1816. He was educated at the University of Edinburgh and became a solicitor in Edinburgh in 1840. In 1845 he became a Parliamentary solicitor in London. With Aytoun he published the once famous 'Bon Guallier Ballads' (1855). His translations comprise many of the works of Goethe, Schiller, Horace, Catullus, etc., and he has written: 'Essays on the Drama'; 'Madonna Pia' (1855); 'Life of Lord Lyndhurst' (1884); 'Life of the Prince Consort' (1875-80); 'Helena Faucit, Lady Martin' (1901).

Martin, William Alexander Parsons, American educator: b. Livonia, Ind., 10 April 1827. He was graduated from the Indiana State University and studied theology. He went to China as a missionary in 1850 and has spent the greater share of his life there engaged in educational and missionary work. He assisted in making the treaty between the United States and China in 1858, and was an authority in China on questions of international law. He was professor and president of Tung Wen College 1868-98, and then president of the New Imperial University until 1900, when it was destroyed in the siege of Peking, in which city he was imprisoned with the American legation. In 1902 he was appointed president of the University of Wuchong. He has edited in Chinese the 'Peking Scientific Magazine,' and the 'Science Monthly,' and has published: 'Siege in Peking' (1900); 'Chinese Legends'; 'The Lore of Cathay' (1901), etc.

Martin, a swallow (q.v.). In the United States the name is restricted to the purple martin (q.v.), several other species of which (genus *Progne*) are familiar garden birds in South America. The bank-swallow (q.v.) is sometimes called sand-martin, especially in England, where the term is more generally used as a synonym of "swallow" than in America.

Martineau, mār'tī-nō, Harriet, English author: b. Norwich 12 June 1802; d. Ambleside 27 June 1876. She was a sister of James Martineau (q.v.). Her first work, 'Devotional Exercises for the Use of Young Persons,' appeared in 1823; and in 1830-1 she won three prizes offered by the Central Unitarian Association for as many essays designed to convert respectively the Catholics, the Jews, and the Mohammedans. "The essays," observes a biographer, "probably converted nobody, but brought in 45 guineas." Next came several stories, mostly intended to inculcate some useful lesson, such as those having the title, 'Illustrations of Political Economy' (1831-4), which were followed by 'Illustrations of Taxation' (1834), and gained an immediate recognition. After a sojourn in the United States (19 Sept. 1834 - 1 Aug. 1836), she published 'Society in America' (1837), intended as a comparison of "the existing state of society in America with the principles on which it is proposed to be founded," and 'A Retrospect of Western Travels' (1838), including some criticisms of slavery that were not well received in this country. Up to about 1851 Miss Martineau

had been known as a Unitarian, but she now showed a decided leaning towards Positivism, and in 1853 published a condensation of Comte's 'Positive Philosophy.' Among her other works of importance may be mentioned her 'History of England during the Thirty Years' Peace' (1849). During the last twenty years of her life her writings consisted mainly of pamphlets and contributions to newspapers and periodicals. A remarkably candid autobiography which had been written for many years was published after her death (1877). Consult also Miller, 'Harriet Martineau' (1884).

Martineau, James, English Unitarian clergyman and philosopher: b. Norwich 21 April 1805; d. London 11 Jan. 1900. His father, Thomas Martineau, the great-grandson of a Huguenot surgeon who left France after the revocation of the Edict of Nantes, was a manufacturer of bombazines. Harriet Martineau (q.v.) was an elder sister. He was sent to Derby in 1821 to study civil engineering, but in the following year became a student of Manchester College, now at Oxford, then at York. On the completion of his college course in 1827 he took charge for a year of Dr. Lant Carpenter's school in Bristol, and in 1828 he accepted a call to the co-pastorship of Eustace Street Presbyterian Church, Dublin. In 1831 he published 'Hymns for Christian Worship,' and next year resigned his pastorate, but shortly afterward accepted the co-pastorate of Paradise Street Chapel, Liverpool, of which, in 1835, he became sole pastor. In 1836 appeared his first separate original work, 'The Rationale of Religious Inquiry,' which attracted considerable attention. In 1839 he was associated with J. H. Thom and Henry Giles in the defense of Unitarianism against attacks by orthodox clergymen, and of the 13 addresses published in 'Unitarianism Defended' (1839) five were by Martineau. In 1840 he published his collection of 'Hymns for the Christian Church and Home,' and in the same year was appointed professor of mental and moral philosophy and of political economy in his old college, now located in Manchester and named Manchester New College. On the removal of the college to London in 1853 he retained his professorship, but did not settle in London till 1857. In 1848-9 he spent 15 months on the Continent, mostly in Germany, during which his philosophical opinions were profoundly influenced by the study of Greek and German philosophy under Trendelenburg. The remaining publications of his first Liverpool period are an essay on 'The Five Points of Christian Faith' (1841), and the well-known collection of sermons entitled 'Endeavors after the Christian Life' (1843-7). During the period 1849-57, when he was pastor of Hope Street Church, Liverpool, he published many articles in reviews, among them that on 'Mesmeric Atheism,' which finally completed his sister Harriet's estrangement from him. In 1859, being now in London, he and J. J. Taylor, principal of Manchester New College, were chosen joint ministers of Little Portland Street Chapel, but from 1860 till his resignation in 1872 Martineau alone supplied the pulpit. On Taylor's death in 1869 he became principal of the college, a post which he held till his resignation in 1885. In 1866 he was a candidate for the chair of logic and mental philosophy in University College, London,

but the united opposition of orthodoxy and secularism led by George Grote managed to defeat him by a single vote. His publications during his connection of 28 years with Manchester New College in London comprise: 'Studies of Christianity' (1869), a volume of sermons; 'Why Dissent?' (1871); 'Hymns of Praise and Prayer' (1873); 'Religion as affected by Modern Materialism' (1874); 'Modern Materialism: Its Attitude towards Theology' (1876), a masterly attack on Tyndall and the scientific materialists; 'Essays, Theological and Philosophical' (1875); 'Hours of Thought on Sacred Things' (1876-80), a collection of the sermons of his maturer period; 'Ideal Substitutes for God Considered' (1880), a criticism of Moral Idealism; 'The Relation between Ethics and Religion' (1882); 'A Study of Spinoza' (1883), his first great philosophical work; and 'Types of Ethical Theory' (1885), the earlier of his two masterpieces. During the remaining years of his life he published his great defense of the essential principles of religion entitled 'A Study of Religion: Its Sources and Contents' (1888); and his freely critical 'Seat of Authority in Religion' (1890); besides a volume of 'Home Prayers with Two Services for Public Worship' (1891), and a collective edition in four vols. of many of his 'Essays, Reviews, and Addresses' (1891). The first academical degree conferred upon him was that of LL.D. by Harvard in 1872, but he received later the degrees of S.T.D. from Leyden (1875), D.D. from Edinburgh (1884), D.C.L. from Oxford (1888), and Litt.D. from Dublin (1892). Martineau was one of the most eminent preachers of his time, but his greatest work was done in the fields of ethics and philosophical theology. At first a necessarian and utilitarian, he was latterly the greatest modern champion of free-will and intuitionism. In the development of his Christology from a sort of Arianism to complete Humanitarianism, and in his ever-increasing insistence upon the continuity of revelation and the purely internal character of ultimate religious authority, he sums up more than any other the history of Unitarianism, and indeed of liberal theology generally during the 19th century. He was a powerful and eloquent champion of Theism against scientific agnosticism and materialism. All his works are written in a uniquely rhythmic style, characterized by a profuse and happy use of figurative language. Consult Jackson, 'James Martineau: A Biography and a Study' (1900); Sidgwick, 'Lectures on the Ethics of Green, Spencer and Martineau' (1902); Drummond, 'Life and Letters of James Martineau'; and Upton, 'A Survey of Philosophical Work' (1902).

Martinelli, mār-tē-ně'l'lē, Sebastian, papal delegate to the United States: b. Lucca, Tuscany, 20 Aug. 1848. He was educated at the College of St. Augustine in Rome and was ordained to the priesthood in 1871. He became superior-general of the Augustinian Order throughout the world and in 1894 was sent to America to visit the monks of that order and shortly afterward was designated apostolic delegate to the United States. In 1896 he was made a special archbishop, and in 1901 was elevated to the cardinalate.

Martingengo-Cesaresco, mār-tē-ně'n'go chā-zā-rēs'kō, COUNTESS Evelyn Lilian Hazeldine

Carrington, Anglo-Italian author: b. England. She was married to the Count Eugenio Martingengo Cesaresco, an Italian writer, and has published 'Essays in the Study of Folk Songs'; 'Italian Characters'; 'The Liberation of Italy'; 'Cavour' in the 'Foreign Statesmen' series; (all these books have been translated into Italian); 'Lombard Studies' (1902); etc.

Martinez, Enriquez, en-rē'kēth mār tē neth, or **Enrico**, Mexican engineer: b. about 1570; d. in Mexico, 1632. His birthplace is variously given as Germany, Holland, Spain (in Ayamonte, Andalusia), or Mexico. He studied engineering in Spain; went to Mexico as interpreter to the Inquisition and with the title of cosmographer royal; and in 1607 undertook to drain the valley of Mexico, threatened by lakes Zumpango and San Cristobal. His canal was fairly successful but inadequate, and after various experiments on the part of other engineers, with whose work Martinez was accused of tampering, he was bidden enlarge his tunnel and canal. He died before the work was much more than started. Martinez established a printing-press in the City of Mexico, and wrote on the natural history of Mexico, on astronomy, and on trigonometry.

Martinez de Cam'pos, Arsenio. See CAMPOS, ARSENIO MARTINEZ.

Martinez de Rozas, Juan, hoo-ān' mār tē-nēth dā rō'zās, Chilean statesman: b. Mendoza, Argentina, 1759; d. there 3 March 1813. He was educated at Cordova; studied law at Santiago; became professor at San Carlos, Chile, in 1781; in 1787 was made assistant intendant of the province of Concepcion; and in 1796 had risen to the second command in the presidency. He took a prominent part in planning the revolution of 1810; was a member of the governing junta until 1811, when he became its president; and showed himself an able administrator and a brave soldier. Carrera quarreled with him, got the upper hand, and banished him to his birthplace, only a few months before his death.

Martinez, mār-tē'nēz, Cal., town, county-seat of Contra Costa County; on the Strait of Karquines, and on the Southern Pacific railroad; about 30 miles northeast of San Francisco, and 85 miles southwest of Sacramento. It is near valuable mines and also rich farm lands, on which large quantities of wheat are raised. A novitiate of the Christian Brothers is here, and the Brothers maintain a library which has about 6,000 volumes. Pop. (1900) 1,380.

Martini, mār-tē'nē, Simone, Italian painter, sometimes mistakenly called Simone Memmi: b. Siena 1284; d. Avignon 1344. He was the founder of the Siennese school of painting and executed frescoes in the churches of Siena, Assisi, Naples, and Orvieto. At the invitation of Pope Benedict XII. he went to Avignon, and in collaboration with his brother Donato decorated the papal palace. He seems to have aimed at flat decorative effect, rather than artistic boldness and originality in his wall painting, and his color is harmonious and fresh, though his faces are conventional. The large painting of the Madonna on the walls of the Palazzo Pubblico is his most important work at Siena (1315); at Florence is to be seen an 'Annunciation' of his in the Uffizi, and fragments of his work also

survive at Avignon. His other more important pictures are 'The Way to Golgotha' (1333) in the Louvre; 'The Blessing of Christ' in the Vatican; 'Christ as a Child with His Parents' in the Royal Institution, Liverpool. Consult: Berenson, 'Central Italian Painters of the Renaissance.'

Martinique, mār-tī-nēk', West Indies, an island of the Lesser Antilles, and, except Guadeloupe, the largest in the Caribbean chain. Area, 381 square miles. It is very mountainous (Mt. Pelée, in the northwest, 4,450 feet; Mt. Carbet but a little lower, while a peak near the southern coast rises to the height of 3,950 feet). The thermometer ranges between 76° and 88° F., the summers being hot and dry, autumn and a part of winter hot and rainy, and spring comparatively cool. In 1901 the inhabitants numbered 203,781. About 3 per cent were Caucasians, who resided chiefly in St. Pierre; the balance of the population—those who, in the main, suffered least from the disaster of 1902—are described as negroes, mulattoes, "copre, chabin, and matés"—that is, blends of the African, Carib Indian (q.v.), Mongolian, and French races. A large part of the surface is covered with forests of silk-cotton, species of mahogany, etc. The flora is closely related to that of South America; the fauna abounds in minor reptiles and insects. Of the snake kind the most dreaded is the fer-de-lance, whose bite is fatal. The principal crop is sugar, and in former years about 60,000 tons were produced annually; but the output has fallen to 25,000 or 28,000 tons. Attempts to raise coffee and cacao on a large scale have not been successful. The total foreign trade in 1901 was: exports \$5,203,329, and imports \$5,394,686. Imports increased by about \$300,000 during the 12 months from May 1902 to May 1903. Martinique is a colony of France, sending one senator and one deputy (two deputies until 1903) to the French legislature. Its affairs are administered by a governor and general council. Educational institutions are: a law school at Fort-de-France, several secondary or normal schools, and about 100 primary schools. The island was acquired by the French in 1635. Toward the close of the 18th and beginning of the 19th centuries it was temporarily held by the British. In May 1902 volcanic eruptions from Mt. Pelée destroyed St. Pierre, which was the largest city on the island, with a population of 26,011, and the residents of that place perished, almost without exception; but the statement commonly made, that "a great part of the island was overwhelmed," is incorrect. The scope of Pelée's work was limited. (See PELÉE MONT.) About 10,000 persons besides those in St. Pierre lost their lives (in all, 20 per cent of the total population); the best agricultural regions, however, in the south and along the eastern coast, were uninjured. The capital, Fort-de-France (population 22,164) is situated in the southwest, and is important as being the military and naval headquarters and rendezvous in the French Antilles; the terminus of the French transatlantic steamers and West Indian cable system. A statue of the Empress Josephine, who was born in Martinique, is one of the ornaments of the public gardens of Fort-de-France. In 1903 the military force consisted of 1,116 French soldiers. The capital has had its share of misfortunes in the past: it was nearly consumed

MARTIN'S FERRY—MARTYN

by fire in 1890, and partially destroyed by an earthquake in 1839.

MARRION WILCOX,
Authority on Spanish America.

Martin's Ferry, Ohio, city, in Belmont County; on the Ohio River, and on the Pennsylvania, the Cleveland, L. & W., the Wheeling B. & T., and the Wheeling & L. E. R.R.'s; almost opposite Wheeling, W. Va. The first settlement was made in 1769 and in 1865, nearly a century later, it was incorporated as a village. The charter under which it is now governed was granted in 1885. It is situated in a region noted for its abundance of bituminous coal, iron, and limestone. The chief manufactures are iron, steel, stoves, shovels, nails, glass, tin, machine-shop products, lumber, barrels, and boxes. The city owns and operates the electric-light plant and the waterworks. Pop. (1890) 6,250; (1900) 7,760.

Martinsburg, mär'tinz-bérg, W. Va., city, county-seat of Berkeley County; on the Cumberland V. and the Baltimore & O. R.R.'s; about 65 miles northwest of Washington, D. C. It is in the vicinity of valuable stone quarries and forests which furnish timber for many mills. The chief manufactures are hosiery, woolen goods, lime, wagons, lumber, and canned goods. The repair shops of the Baltimore & Ohio Railroad and slate and limestone quarries furnish employment for a number of people. The chief buildings are the government building, which cost \$100,000; the Berkeley Female Seminary, the Berkeley Female Institute, and the King's Daughters' Hospital. The waterworks are owned and operated by the municipality. Pop. (1900) 7,564. Martinsburg, as the chief city of the lower Shenandoah Valley, on the main road leading across the Potomac, the converging point of several roads, with the Baltimore & Ohio Railroad running through it, was an important point in the military operations of the valley during the Civil War. Then it was in Virginia. Early in July 1861 Gen. Patterson, after a slight skirmish, occupied the place, the Confederates falling back to Winchester. Patterson soon abandoned it, and it was reoccupied by the Confederates. Early in March 1862 it was again occupied by the Union forces under Gen. Banks, the Confederates falling back up the Valley. It was abandoned 25 May 1862, after Banks' defeat at Winchester, but soon reoccupied by Banks. On 8 Sept. 1862 Gen. Julius White was in command of the place with about 2,500 men of all arms. At this time Gen. Lee had crossed the Potomac and was at Frederick, Md. On the 10th Jackson led a column from Frederick, crossed the Potomac at Williamsport, and moved on Martinsburg. White retreated during the night of the 11th to Harper's Ferry. In June 1863, when Ewell's corps moved down the valley on the Gettysburg campaign the place was held by Col. B. F. Smith with 1,200 infantry and a battery. On 13 June Ewell, at Cedarville, detached Jenkins' cavalry brigade and Rodes' infantry division to surround and capture the Union forces at Berryville and Martinsburg. Both garrisons escaped, Smith, with the greater part of his infantry, crossing the Potomac at Shepherdstown and making his way to Maryland Heights. The battery retreated by the Williamsport road, was pursued, and lost five of its six guns, with 200 infantry accompanying it. On 1 July 1864 the place was held

by Gen. Sigel with about 3,200 infantry and dismounted cavalry, and a battery. On the 2d Early arrived at Winchester on his campaign to menace Washington and, under Gen. Lee's instructions, first to clear out the lower Valley and wreck the Baltimore & Ohio Railroad. Parties were sent north and west against the railroad, and on the 3d Bradley T. Johnson, with a cavalry brigade, was ordered to move through Smithfield and Lee Town, cross the railroad at Kearnsville, east of Martinsburg, and, pushing north, unite with McCausland at Hainesville beyond Martinsburg. Johnson arrived at Lee Town early in the morning, where he was met by Col. J. A. Mulligan with about 2,000 men and a battery, and after a hard fight was driven back on the divisions of Rodes and Ramseur, which were supporting him. Breckinridge's division, which marched on the main road to Martinsburg, drove before it Stahel's cavalry, on outpost at Darksville. Sigel, warned of approaching danger, burned his stores, collected his command, and, leaving Martinsburg on the night of the 3d, crossed the Potomac at Shepherdstown and occupied Maryland Heights. Early cleared the Valley and advanced on Washington, and on the 11th Martinsburg was occupied by Sullivan's division of Hunter's command, and remained in Union occupation until the 25th, when Crook, being defeated by Early at Kernstown, was driven through Winchester, made a short stand at Martinsburg, and recrossed the Potomac at Williamsport. Early again occupying the town and destroying the railroad on either side of it, and continuing in possession until 10 August, when, upon Sheridan's advance to Halltown, he abandoned Martinsburg and Winchester and fell back to Strasburg. He advanced from Strasburg on the 17th and reoccupied Martinsburg on the 19th with his cavalry. From this time until 17 September the place was held alternately by Union and Confederate cavalry, on the 17th by Averell's Union division. On that day Early left Winchester with a heavy force of infantry, cavalry, and artillery, and on the 18th attacked and drove Averell from Martinsburg across the Opequon. Sheridan defeated Early on the Opequon on the 19th, and drove him up the Valley; and Martinsburg was again occupied by Union troops, to remain in their possession until the close of the war.

E. A. CARMAN.

Mar'ty, Martin, Roman Catholic bishop: b. Schwyz, Switzerland, 12 Jan. 1834; d. St. Cloud, Minn., 19 Sept. 1896. He received a collegiate education in Switzerland and Austria, was ordained to the priesthood in 1856 and in 1860 came to the United States. He assisted in the founding of a priory at St. Meinrad's, Ind., and was its first superior; through his efforts the priory became an abbey in 1870 and Marty was raised to the rank of mitred abbot. He resigned his office several years later in order to perform mission work among the Indians of Dakota, over whom he gained a wide influence. He mastered their language and wrote a Sioux grammar and dictionary. In 1880 he became the first bishop of Sioux Falls, and in 1894 was transferred to St. Cloud, Minn.

Martyn, mär'tin, Henry, English missionary to India: b. Truro, Cornwall, 18 Feb. 1781; d. Tokat, Asia Minor, 16 Oct. 1812. He was

graduated from St. John's College, Cambridge, in 1801; became a fellow of the same college in the next year; and, turning from the law, took orders, and landed in India in 1806. After three years at Dinapore he was transferred to Cawnpore, where he opened a church in 1810, in spite of violent opposition, and where he completed a Hindustani version of the New Testament. To perfect a translation of the New Testament into Persian and to recover his health in 1811 he traveled into Persia. In Tabriz he was taken ill with a fever; and on his hurried journey home was compelled to stop at the plague-stricken town of Tokat, where he died. He was the great missionary hero of the Church of England up to the early part of the 19th century. Martyn's works include 'Controversial Tracts on Christianity and Mohammedanism,' and versions of various parts of the Bible into Hindustani, Persian, and Judæo-Persic. Consult the lives by Sargent (1819), Bell (1880), and George Smith (1892); as well as Martyn's 'Journals and Letters' (1837).

Martyn, William Carlos, American Presbyterian clergyman and historical writer: b. New York 15 Dec. 1843. He was graduated from the Union Theological Seminary in 1869, was ordained to the Presbyterian ministry in that year, and has held several important charges, but has devoted his later years to literary work. Since 1897 he has been director of the Abbey Press. He has published: 'Life of John Milton' (1866); 'Pilgrim Fathers of New England' (1870); 'Wendell Phillips—the Agitator' (1890); 'Christian Citizenship' (1896); 'Sour Saints and Sweet Sinners' (1898); etc.

Martyn'ia, a genus of annual and perennial herbs of the order *Pedaliaceæ*, or according to some authors, *Bigoniaceæ*. The ten species have tuber-shaped roots; thick sub-erect stems; opposite or alternate heart-shaped leaves; showy catalpa-like flowers in short terminal racemes; and horned capsules which suggest the names unicorn plant and proboscis-flower. When ripe the capsules split and expose numerous black wrinkled seeds. The stems and foliage are clammy and malodorous, but the flowers of some species not unpleasantly perfumed. The species are all natives of warm parts of America, especially of the lower Mississippi Valley. They are often planted for ornament, as curiosities, and for their capsules, which while young and tender are used as material for pickles. *M. proboscidea*, to which the popular names are generally applied, is the most commonly grown.

Martyr (Greek for "witness"), a designation applied by the Christian Church to those persons in particular who, in the early ages of Christianity, suffered death rather than renounce their faith, and thus testified their confidence in the truth of the new doctrines. Martyrs are sometimes classified as of three classes: martyrs in will and deed, like St. Stephen; those in will, but not in deed, like St. John, who escaped from the death ordained for him by Domitian; and those in deed but not in will, like the Holy Innocents. An account of the life, persecutions, and death of the Christian martyrs is called a martyrology (q.v.). A tomb or oratory erected on the spot where a martyr suffered was called martyrium, martyr. Festivals in honor of the martyrs seem to have been observed as early as the 2d century. The Christians offered prayers

at the martyr, and thanked God for the example which they had given to the world. The rite was concluded with the sacrament of the Lord's supper and the distribution of alms. Eulogies were also delivered, and accounts of the lives and actions of the deceased read. These festivals were called the birthdays of the martyrs, because on the day of their death they were born to eternal life.

Martyr, mār'ter, **Petër**. See **PETER MARTYR**.

Martyrology, called also calendar of the saints, the acts of the saints, menology, anology, synaxary, a list of martyrs and other saints, in which was sometimes noted the character of their lives, and in the case of a martyr the place and date of his martyrdom, and the nature of the sufferings which he underwent. Baronius, an ecclesiastical historian of the 16th century, attributes to St. Clement of Rome, almost contemporary with the apostles, the first idea of collecting the acts of the martyrs. In the time of Gregory the Great (end of the 6th century) the Church possessed a general martyrology, the author of which is said to have been St. Jerome, who made use of materials collected by Eusebius of Cæsarea. The only part of it now extant is a catalogue of the martyrs who suffered in Palestine during the last eight years of the persecution of Diocletian. There is a martyrology attributed to Bede (beginning of 8th century), but if not altogether spurious it is at least interpolated. Numerous martyrologies were produced in the next century and subsequently. In 1586, under the auspices of Sixtus V., a martyrology was printed at Rome, with notes by Baronius, with the title of 'Martyrologium Universale.' Ruinart's 'Acta Primorum Martyrum Sincera' appeared at Paris in 1689, and a new edition of it was published in 1850. The 'Acta Sanctorum (q.v.)' of the Bollandists comprises over 60 volumes issued at various times from 1643, but the work is still incomplete. The well-known English work of John Foxe, 'The Book of Martyrs,' may also be mentioned.

Marulic, Marko, a Croatian poet and historian: b. Spalato in 1450; d. 1524. After studying at Padua he entered a monastery in Spalato, where he wrote most of the works which stamped him as the foremost of Croatian authors and rendered his name one of the greatest in the literature of Ragusa. Among his works the most noted was 'De Institutione Bene Vivendi,' published in 1511. His poems were republished with a biography (Agram 1869).

Mar'vel, Ik. See **MITCHELL, DONALD G.**

Mar'vell, Andrew, English poet and satirist: b. Winestead, Holderness, Yorkshire, 31 March 1621; d. London 18 Aug. 1673. He was graduated from Trinity College, Cambridge, in 1638; after activity as poet and tutor became colleague of Milton in the Latin secretaryship in 1637; was three times elected to Parliament for Hull; and under the Restoration attacked Charles II. and advocated a republic. His chief poem is the 'Horatian Ode Upon Cromwell's Return from Ireland' (written 1650; first printed 1776). The shorter poem, 'The Bermudas,' is also well known.

Marvin, Charles Frederick, American meteorologist: b. Putnam, Ohio, 7 Oct. 1858. He

was graduated as a mechanical engineer from the Ohio State University in 1883, where he had been instructor in mechanical drawing and laboratory practice since 1879. In 1884 he was appointed to the United States signal service, and later was made professor of meteorology in the weather bureau. He has made many important investigations and discoveries in connection with the work of the weather bureau, and has written quite extensively concerning them.

Marx, märks, Karl, German socialist: b. Trèves 5 May 1818; d. London 14 March 1883. He was educated at the universities of Bonn and Berlin, and in 1842 took up journalism, becoming editor of the 'Rheinische Zeitung,' a democratic journal; his socialistic articles in this paper caused its suppression in 1843. Marx then proceeded to Paris, where he became one of the editors of the 'Deutsch-Französische Jahrbücher,' to which he contributed articles on the 'Hegelian Philosophy of Right.' He was expelled from France in 1845, and retired to Brussels, where he assisted in organizing the German Workingmen's Association, was also active in the organization of the Communist League, and with Engels issued the famous Communist Manifesto in 1847, which was the first public declaration of international socialism. In 1848 Marx returned to Germany, started the 'Neue Rheinische Zeitung,' and was active in the revolutionary movements of that year. Banished from Germany in 1849, he went first to Paris, then to London, where he lived till the time of his death. He devoted himself largely to the study of economic questions, and was correspondent of the New York *Tribune* and other papers. In 1864 he took a leading part in the organization of the International Workingmen's Association (q.v.), was selected to formulate its programme, and practically shaped its policy for a number of years; he was also interested in the organization of the German Social Democrats who united with the International in 1869. After 1873 he took no active part in politics, but devoted his time to the completion of his work on capitalism, 'Das Kapital' ('Capital'), the first volume of which had been published in 1867 (English translation, 1886); the second and third volumes were left in MS., and Vol. II. was published in 1885, Vol. III. in 1894, under the editorship of Engel. He also wrote: 'Zur Kritik der Politischen Oekonomie' (1859); 'Lohnarbeit und Kapital' (English translation, 'Wage Labor and Capital'); 'Misère de la Philosophie' (1847); 'The 18th Brumaire of Louis Bonaparte' (1852); 'Life of Lord Palmerston' (1850); and 'Revolution and Counter-Revolution,' a reprint of a series of letters in the New York *Tribune*, in regard to the revolution of 1848 in Germany.

Marx was undoubtedly the founder of the modern socialistic school, in that he first gave definite scientific statement to the principles of modern socialism. His greatest and best-known work, 'Das Kapital,' is a monument of acute reasoning, extensive reading and knowledge, and skilful exposition. In this he analyzes carefully his theory of value, which is that the measure of the value of a commodity is the amount of labor "socially necessary" to produce it, and shows how under the capitalistic system the laborers are exploited of what they produce over and above their wages (surplus value). He

also traces the development of capitalistic production, the growth of the working class or proletariat which is finally to transform or revolutionize society, and lays down the principle that the fundamental factor in the development of society is the method of production and exchange; hence the socialist movement must simply assist and hasten the changes in progress. Marx was not only a scholar and thinker, but an organizer and agitator of unusual power, a strong and virile personality whose influence is still felt upon the labor movement of to-day. See SOCIALISM. Consult: Aveling, 'The Student's Marx'; Deville, 'The People's Marx,' for epitomes of 'Capital.'

Ma'ry (in the Greek text *Mariam*; the same as *Miriam*), distinctively known as the Virgin Mary, the mother of Jesus, is described in the gospel history as a virgin in humble circumstances, but of the stem of David, who lived in obscurity in Nazareth, a city of Galilee, and was betrothed to Joseph, a carpenter. A heavenly messenger broke in upon her solitude with a salutation of the deepest veneration. The Virgin was astonished at the appearance: her humility could not account for such a mark of distinction. The angel saluted her as the highly-favored of God, and announced to her that she should bear a son who should be called the Son of God, the long-expected Saviour of the Jews. "How shall this be," she replied, "seeing I know not a man?" The angel informed her that the power of God should overshadow her, and make that which seemed impossible a reality. She bowed in submission to the will of the Supreme — "Behold the handmaid of the Lord: be it unto me according to thy word." Her apprehension of her exalted prerogative is shown in the wonderful song of praise and joy into which she bursts at the greeting of her cousin Elizabeth, the mother of John the Baptist, and now called the *Magnificat*, in which she predicts that all generations shall henceforth call her blessed. It was in a stable at Bethlehem, whither she and Joseph had come from Nazareth to be enrolled in the census ordered by the Emperor Augustus, that she gave birth to the Saviour. It was to the stable at Bethlehem that the shepherds, instructed by the angels, came to do homage to the new-born infant; and thither also the Magi, led by the strange star, came to offer Him their gifts. All this she evidently understood as the right of the Divine Babe, who had been conceived in her womb by the power of the Most High. Nor was she astonished at the prophecy of Simeon, when the babe, according to the Jewish custom, was presented in the temple. At the wedding of Cana she sought the miraculous powers of her Son to relieve the embarrassment of their hosts occasioned by the want of wine. She attended Him through all his perilous course to Golgotha with ever watchful anxiety, for we find her absorbed in silent sorrow at the foot of the cross with the beloved disciple, St. John. To his care Jesus entrusted her as to a son: "Woman, behold thy son." After that He said to the disciple, "Behold thy mother." She appears for the last time in Scripture in the "upper room" in Jerusalem, praying with the Apostles when the Holy Ghost descends upon them. There is a tradition that she died at Jerusalem 63 A.D.

MARY

By the time of the 4th century the religious veneration of Mary had become distinctly marked in the cultus of the Church. From the earliest period she had been spoken of by writers as *theotokos*, or the mother of God. "This term," says Cardinal Newman, "was familiar to Christians from primitive times, and is used, among other writers, by Origen, Eusebius, St. Alexander, St. Athanasius, St. Ambrose, St. Gregory Nazianzen, St. Gregory Nyssa, and St. Nilus." Theologians in general began to maintain the opinion as a doctrine of faith, that Mary always remained a virgin, and her perpetual virginity is held both by the Greek and the Roman Catholic Church. A party in Arabia, which regarded her as the actual wife of Joseph and the mother of several children by him, was called in the 4th century *Antidikomarianites*, that is, the adversaries of Mary. At the end of the 4th century Helvidius in Palestine and Bishop Bonosus in Illyria were declared heretics for the avowal of similar opinions. The sentiment of veneration for the Virgin grew fuller and deeper as the Church emerged from the shadow of the persecutions and became the public worship of the Empire. When the teaching of Nestorius, who held that Jesus, the son of Mary, was begotten a mere man, and that the divine nature was afterward added to him, was condemned by the Council of Ephesus in 431, which declared that the divine nature already existed in the son, that was born to Mary, at the time of his birth, and that that son was from the first both God and man, her cultus greatly increased, and in course of time the veneration that was felt for her came to express itself in a more formal devotion. In the 6th century the Christian Church began to celebrate festivals in her honor, of which the Purification, the Annunciation, and the Visitation (the visit of Mary to Elizabeth) are still retained among some Protestant bodies. The Greeks and Roman Catholics observe various feasts besides the above in honor of the Virgin; for instance, the immaculate conception of Mary, her birth, her espousals, and her ascension to heaven; that is, her death and the reception of her body into heaven (in English known as the *Assumption*). Catholics object to the statement that they worship or adore Mary, preferring to use rather such words as veneration, reverence, and devotion. Their veneration in fact has a distinct term applied to it by theologians, namely *hyperdulia*, being higher than that given to saints—*dulia*—and lower than that offered to God alone—*latria*. She is far from being regarded as in any way on an equality with God or her Divine Son. She is but a creature, but she is looked upon as the highest of all creatures, who has been especially honored by God himself in selecting her above all others to be His mother; to her, therefore, is due a special veneration in keeping with her high prerogative. Several religious orders have been instituted in honor of the Virgin Mary, among which are the mendicant order of Servites, and all the orders of females called by her name; for example the nuns of the Conception, of the Annunciation, of the Visitation. In Christian art Mary as the Madonna occupies a most important position, and all the chief events in her life have formed the subject of paintings executed by some of the greatest artists, bearing such titles as the

Nativity, Adoration of the Magi, Marriage with Joseph, Flight into Egypt, etc.

Sacred history mentions several other Marys (in the Greek text *Maria*):

1. Mary of Bethany, the sister of Lazarus, the ready disciple and tender worshipper of Jesus, to whom he vouchsafed his peculiar friendship and an imperishable name (Mat. xxvi. 13).

2. Mary of Magdala, or Mary Magdalen, who was cured by Christ of an inveterate disease, and proved her gratitude by the most devoted adherence to him. She served him with her property, attended him on his journeys, and wept at his crucifixion. She was the last to leave his grave, and the first to visit it on the morning of the resurrection, and to behold her risen Lord. See also MAGDALEN.

3. Mary, the sister of the Virgin Mary, supposed by some to be the same with Mary the wife of Clopas (not Cleophas, as in John xix. 25) or Alphæus (another Greek form of the same Aramaic name), and the mother of the Apostle James the Less.

Mary I., queen of England, known popularly as "Bloody Queen Mary": b. London Feb. 1516; d. there 16 Nov. 1558. She was a daughter of Henry VIII. After the death of her mother, Catharine of Aragon, she was declared illegitimate; but was restored to the succession in 1544. She was bred by her mother in the Roman Catholic faith, on which account she was treated with rigor under Edward VI. She ascended the throne 16 July 1553, after an abortive attempt to set her aside in favor of Lady Jane Grey (q.v.). One of her first measures was the reinstatement of the Roman Catholic prelates superseded in the late reign. Her marriage to Philip II. of Spain, united as it was with a complete restoration of the Catholic worship, produced much discontent. Insurrections broke out under Cave in Devonshire, and Sir Thomas Wyatt in Kent, which, although suppressed, formed sufficient excuses for the imprisonment of the Princess Elizabeth in the Tower, and the execution of Lady Jane Grey and her husband Lord Guilford Dudley. England was now formally declared to be reconciled to the pope; the original laws against heretics were revived, and about 200 perished at the stake, including Cranmer, Latimer, and Ridley (q.v.). Under Philip's influence a war began with France, which ended in the loss of Calais in 1558, after it had been in the hands of the English for above 200 years. This disgrace told acutely upon Mary's already disordered health, and she died after a reign of five years. Consult the 'Life' by Strickland in 'Lives of the Queens of England' (new ed. 1864-5); Lingard, 'History of England'; Froide, 'History of England'; Stone, 'Mary I, Queen of England.'

Mary II., queen of England: b. London 30 April 1662; d. there 28 Dec. 1694. She was the daughter of James, Duke of York, afterward James II. She was married in 1677 to William, prince of Orange, and when the Revolution was effected which dethroned her father, Mary was declared joint-possessor of the throne with her husband, King William, on whom the administration of the government devolved. During the absence of William in Ireland in 1690-1, Mary managed parties at home with extreme prudence,

MARY OF THE INCARNATION — MARYLAND

and acted with equal ability as regent in 1693 and 1694. She was strongly attached to the Protestant religion and the Church of England. She endowed William and Mary College, Va., originally intended for the training of missionaries. Consult: Doebner, 'Memoirs and Letters of Mary II., Queen of England'; Marshall, 'Kensington Palace in the Days of Queen Mary.'

Mary of the Incarnation, French-Canadian Ursuline: b. Tours, France, 1599; d. Quebec 1672. Her maiden name was Guyard and in her 18th year she became the wife of M. Martin, but was left a widow with an infant son at 19. She eventually took the veil in the Ursuline Convent at Tours, and in 1639 went to Canada as superior of the convent established at Quebec by Madame de la Peltrie (q.v.). She was extremely successful in administering the school for girls which the Ursulines opened, impressed all with her strong and beautiful personality, which was emphasized by her fine manners and tall stature, and she is one of the most stately and interesting figures in early Canadian history. She wrote an autobiography and her son wrote her life also. Consult: 'Lettres de la vénérable Mère Marie de l'Incarnation' (1681).

Mary Magdalen. See MAGDALEN; also MARY.

Mary Stuart, queen of Scotland: b. Linlithgow Palace 8 Dec. 1542; d. 8 Feb. 1587 at Fotheringay Castle. The only child of James V. of Scotland, she was proclaimed queen upon his death, 14 Dec. 1542, and was crowned 9 Sept. 1543 at Stirling Castle. Negotiations for her hand by the future Edward VI. of England came to nothing in spite of the attempt to effect the betrothal by force of arms. In 1548, having been betrothed to the French Dauphin, she was sent to Paris, where 10 years later she married the Dauphin, who died in 1560 soon after coming to the throne. Mary returned to Scotland, where her French Catholic training and the new Scottish Reformation made her position a hard one. She diplomatically yielded to the force of circumstances and surrounded herself with Protestant advisers. A match between the Scottish queen and Don Carlos of Spain, heir of Philip II., was all but arranged when Mary, in 1565, met Lord Darnley, her cousin, whom she married 29 July 1565. She had hoped to win by this marriage the English Catholics, with whom Darnley had great influence, and to unite all Catholic claims to the English throne, Darnley (see MARGARET TUDOR) being next in succession to Mary; but her husband's weak ambition made him the tool of the Protestant plot against Rizzio, an Italian favorite of the queen, who was killed 9 March 1566, being brutally dragged from Mary's dining-room. Three months later Mary gave birth to a son (later James I. of England). She was temporarily reconciled to Darnley; but on 10 Feb. 1567, Darnley's house was blown up and he was killed. Mary had been in the house late the evening before, and the murder was laid to the Earl of Bothwell, whom Mary married 15 May 1567. This act turned all the nobles against her; she was forced to surrender to her enemies, and 24 July 1567 to abdicate the crown. She was imprisoned in Loch Leven Castle; escaped thence in May 1568; was unsuccessful in her attempt to raise an army; crossed into

England, entrusting herself to Elizabeth; and was almost immediately imprisoned. Elizabeth wished to put Mary out of the way, seeing in her a dangerous rival for the English crown, but fear of France and Spain held her back until 1585, while Mary was imprisoned at Tutbury and entrapped into the Babington conspiracy against Elizabeth. Although her complicity was not clearly proved she was beheaded at Fotheringay. The moot point in Mary's tragic history is whether she was a party to Bothwell's assassination of Darnley. That she was, is apparently proved by letters from her to Bothwell, which the Scottish nobles declared they found in Bothwell's jewel-case; but the originals of these letters are not to be found, and their authenticity is doubtful. The matter is ably discussed in Cowan's 'Mary, Queen of Scots' (1901), and Lang's 'The Mystery of Mary Stuart' (1901). The point at issue is, however, confused by making it depend on the authenticity of these letters, for Mary's guilty knowledge of the plot against Darnley seems indubitable. But her career had more than a personal significance since in her person were combined the last hopes of Catholic rule in England, and an intense devotion to Catholicism. Personally she was of a dazzling complexion, apparently her main claim to beauty, marvelously winning, as her early career shows, and clever in argument, as was evidenced nowhere more plainly than in her trial for treason. Consult: Swinburne's sketch in 'Encyclopædia Britannica'; De Peyster, 'Mary Stuart' (1890); Bell, 'Life of Mary, Queen of Scots' (1890); Mignet, 'Histoire de Marie Stuart' (1851); Froude, 'History of England' (1881); Hume, 'Love Affairs of Mary, Queen of Scots' (1903).

Maryland is one of the 13 Original States and was the seventh to join the Union. It is on the South Atlantic coast, between lat. 37° 53' and 39° 43' N., and lon. 75° 4' and 79° 33' W. It is bounded on the north by Pennsylvania and Delaware, east by Delaware and the Atlantic Ocean, and south and west by Virginia. The extreme length of the State from east to west is 240 miles; its width from north to south is 125 miles. The total area is 12,210 square miles. Land surface, 9,880 square miles; water surface, 2,350 square miles. The number of incorporated cities, towns, and villages is 98. Population (1900) 1,188,044. Capital, Annapolis. Baltimore is the chief commercial city and financial centre.

Topography.—The most marked physiographic feature of Maryland is its division by the Chesapeake Bay into two unequal parts known as the Eastern and Western Shores. Into this bay many affluents pour their waters. On the Eastern Shore the principal rivers are the Elk, the Sassafras, the Chester, the Choptank, Nanticoke, Wicomico, and Pocomoke; on the Western Shore the Gunpowder, the Patapsco, the South, the Severn, the Patuxent, and the Potomac. At the head of the Bay the Susquehanna River draining a large section of New York and the whole of Central Pennsylvania, brings its tribute of waters gathered from a hundred streams to freshen this inland sea. This body of water exercises a most genial and tempering influence on the climate of the bordering region. The winters are short and rarely severe. The average temperature of this part of the State is in summer 75.5; winter, 36.9; for the

MARYLAND

year, 55.6. The soil of this section is of a light loam, favorable to the production of all the cereals, and all kinds of fruits and vegetables in great abundance. The average elevation of the land above tide-water of this coastal region is about 50 feet in the lower part, and 100 feet in the upper part of the Eastern Shore; and about 125 feet in the peninsula part of the Western Shore, that is, that part of the State lying between the Chesapeake Bay and the Potomac River. In the central or northern part of the State lying between the upper waters of the Bay and the Blue Ridge Mountains, the elevation is from 300 to 400 feet above tide-water, increasing to 600 and 700 feet, as it stretches from the bay shore to the mountains in the western part of the State. This part of the State is undulating in its surface, is intersected by numerous streams, some of very considerable size, as the Gunpowder, the Patuxent, the Patuxent, the Monocacy, Great Pipe Creek, the Antietam, and the Conococheague. These streams, generally called falls by the early settlers of this region on account of their rapid descent from the uplands, furnish abundant water power for manufacturing purposes. This region is also intersected by several ridges of an elevation of about 800 feet, dividing the country into rich and fertile valleys. This section is traversed by the Blue Ridge range of mountains, some of whose peaks are from 2,000 to 2,400 feet high. The great Appalachian chain passes through the western part of the State, through Allegany and Garrett counties. The highest peak of this range is Backbone Mountain in Garrett County, 3,700 feet high. Other peaks range from 1,500 to 3,500 feet in elevation.

Geology.—The geological formations vary with the surface elevations. The southern section of both the eastern and western shores is alluvial; north of the alluvial deposit is a Tertiary formation; northwest of this come metamorphic rocks; west of them a wide belt of Silurian and Devonian formation; and still farther west Carboniferous strata beginning at Cumberland. In the Tertiary we find marl in abundance; in the metamorphic rocks gneiss, granite, limestone, and iron; in the Carboniferous extensive veins of bituminous coal of the best quality. Over 200 kinds of marble have been found in the State, some of them equal to the Italian marbles.

Mineral Resources.—Maryland is rich in mineral resources. Iron ore is extensively distributed throughout the western part of the State, and in the northern part of the Eastern Shore, and is of good quality for casting and other purposes. The iron industry is of early origin. Forges and furnaces were in operation in the colony as early as 1649, and their products were used in the province and sometimes exported to other colonies. Limestone also abounds throughout the middle and western parts of the State, furnishing a valuable fertilizer and an excellent material for roadbeds, for both of which purposes it is extensively used. Clay and kaolin of an excellent quality for bricks, tiles, and water mains and for pottery use, are found in great abundance throughout this region, especially in Harford and Baltimore counties. Baltimore brick ranks high for building purposes in fineness and durability. Of building stone there is a great variety and of

superior quality in Maryland. Marble, granite, gneiss and sandstone are found abundantly in Harford, Baltimore, Howard, Carroll, and Montgomery counties. The white marble of Baltimore County is of a high character and reputation for monumental and building purposes, and for more than fifty years has been extensively used for public structures, churches, and private buildings in Washington, Baltimore, and other cities. The monoliths in front of the Capitol at Washington are from these quarries. The noble shaft erected by the nation to the father of his country was constructed almost wholly of this material. There are extensive quarries of granite and gneiss in Harford and Howard counties, which are profitably worked. Variegated marbles of a superior quality and susceptible of a high finish are found in Frederick County. There are immense and almost inexhaustible deposits of coal and iron in Allegany and Garrett counties. The coal is of the rich, semi-bituminous variety, especially valuable for its steam-producing quality. The famous George's Creek Big Vein, 14 feet thick, is located just west of Cumberland. The total value of the mineral product of Maryland in 1900, including coal, iron, clay, and building stones, was \$8,653,000. Coal heads the list with a value of \$5,000,000; brick and tile follow with a value of \$1,100,000.

Agriculture.—In the Colonial period agriculture was the principal employment of the people. Along the shores of the Bay and the rivers emptying into it, plantations were large and were cultivated by slave labor. Tobacco was the staple crop for which there was generally an active demand in the European markets on account of its quality. This led to an extensive commerce for that period, and brought wealth to the planters. Tobacco was for a long time the currency of the Colonies. Debts, dues, and fines were paid in that currency. The constant cultivation of this plant gradually exhausted the soil. The planters took up new land, which, in time, underwent the same process of deterioration. The growth was discouraged. Fertility has been restored to these impoverished soils by the application of guano and other fertilizers; and other kinds of crops are raised, and the average yield of wheat per acre in some sections is as large as the average is in some of the Western States. Tobacco is still cultivated largely, and a State inspection of it is made. But the crops are much more diversified, wheat and corn being the principal ones. In the central and northern parts of the State, the soil is of a clayey nature and very fertile. Carroll, Frederick, and Washington counties contain some of the best farming lands in the United States. The soil is rich, and the yield of wheat and corn per acre is large. The lands in Baltimore, Harford, and Montgomery counties are of the same general character, producing abundantly the same cereals, and also heavy vegetable and fruit crops for the markets and for canning purposes. Their proximity to large cities and the facilities they possess by railroad transportation make vegetable, truck, and dairy farming very profitable. Throughout the coastal region vacant land can be bought at from \$5 to \$10 and \$15 per acre; with improvements farms can be bought for from \$20 to \$35 per acre. In the central and northern sections there is very little vacant land. But good farming lands in this

MARYLAND

region can be bought for from \$50 to \$100 and \$125 per acre with improvements. In 1900, the total number of farms in Maryland was 46,012. Of this number 29,313 were cultivated by the owners; 15,447 by tenants; 1,052 by managers. The total value of the farms with buildings was \$175,178,310. The average value of land per acre was \$23.28. The amount realized on the large crops in 1900, that is for wheat, corn, oats, rye, tobacco, etc., was \$20,814,371, and from fruit, vegetables, and truck farms was \$15,195,629, making a total value of farm products \$35,000,000. The estimated value of the buildings \$54,810,760, and the value of animal products, \$13,606,877.

The forest trees are principally pine, chestnut, oak (with three varieties, white, black, and red), hickory, and walnut. The staple fruit crops are peach and apple, which cover many thousands of acres. Maryland peaches, fresh and canned, are exported to all quarters of the country. Tomatoes, melons, small fruits, and all kinds of vegetables are cultivated on the Eastern Shore and sent to the markets of Baltimore, Philadelphia, and New York. The mountains still contain deer; and wild geese and swans are found in large numbers at the proper season on the Bay and its tributaries, as well as woodcock, grouse, partridge, and turkeys. Immense flocks of wild ducks of various species throng the estuaries of the Chesapeake on the approach of cold weather.

Fisheries.—From the earliest period of her history, fisheries attracted the attention of the people of Maryland. Her waters swarm with fish of every variety and oysters and terrapin of superior flavor. The annual value of the sea food, fresh and canned, supplied by the Bay and its tributaries, amounts to \$10,020,000. Of this amount oysters alone contribute \$3,500,000.

Manufactures.—Maryland by reason of her proximity to the sources of production of the raw material, to the great coal fields, and of the great water-power she possesses in her swiftly flowing streams, her unequalled facilities in water carriage, and her complete railroad connections with every part of the country, engaged early and successfully in manufactures. They embraced nearly every species, textiles, iron and steel, lumber, paper and printing, chemicals, clay, glass and stone, metals, tobacco, clothing, vehicles, shipbuilding of wood, iron, and steel, and hand trades. The manufacturing plants are mostly established in Baltimore, and its vicinity, and the cities of Cumberland, Hagerstown, and Frederick, and the small towns of the central and northern parts of the State. In 1903, the number of manufacturing establishments in the State was 11,529; the capital invested in them was \$164,422,926; annual average number of employees, 108,325; value of the finished product, \$242,552,990; average annual wages, \$38,762,961. In Baltimore alone, there were in 1903, 6,717 manufacturing establishments with a capital of \$163,945,811, the annual value of whose product was \$164,945,811. In manufacturing industries, Baltimore ranks as seventh among the cities of the United States, being especially prominent in clothing, canning of fruit and vegetables, tobacco manufactures, and iron work.

Shipbuilding.—Living on the shores of the Bay and its estuaries, the ancient Marylander naturally took to boat and shipbuilding, and the

fast-sailing clipper ships of Baltimore were, before steam became the main motor power in propelling ships, famous for their swiftness, and carried the flag and commerce of the United States to every part of the world. In 1900, Maryland ranked as the fifth State in shipbuilding. The capital invested in this business was \$19,262,193, with a product valued at \$10,563,193. There are four large plants engaged in iron and steel shipbuilding in Baltimore and vicinity. A large one recently established at Sparrow's Point, 12 miles from Baltimore, is engaged as well in the manufacture of structural iron and steel. Its products in 1902 amounted in value to \$3,299,491, and it gives employment to 2,000 workmen.

Transportation.—The railroad mileage in the State is 1,366.07. The Pennsylvania and Baltimore & Ohio systems own the greater part of it. The first railroad in the United States, and on which the first locomotive was run, was built in 1830 between Baltimore and Ellicott City. The first line of telegraph in the United States was constructed and operated in 1844 between Baltimore and Washington. There are 35 lines of railway, either centring or passing through Baltimore, or directly or indirectly, in connection with other roads, furnishing means of constant and rapid communication and intercourse with all the large cities of the Union and to every section of the country. Sixteen steamship and steamboat lines connect Baltimore with domestic and foreign ports.

Commerce.—The imports of merchandise at the port of Baltimore for 1900 aggregated in value, \$19,688,476; and the exports, \$11,462,168; giving a total foreign trade of \$31,150,644. The principal articles of export were oysters, tobacco, coal, petroleum, grain, sugar, cotton, cattle, and flour.

State Finances.—The net amount of the debt of the State after deducting productive stocks and the sinking fund is \$2,616,704.23. The total assessed value of property in the State is \$666,857,893; of the city of Baltimore, \$491,921,328; basis of taxation of the State outside of Baltimore, \$174,936,475. The rate of the State tax on 100 is 17 cents. The receipts of the State for the year 1900 amounted to \$3,622,493; balance in treasury, \$707,926; total, \$4,330,419; disbursements, \$3,480,534; cash balance in treasury, \$849,885.

Government.—The governor is elected for a term of four years, and receives a salary of \$4,500 per annum. Legislative sessions are held biennially in even years, beginning on the first Wednesday in January, and are limited in length to 90 days. The Legislature has 26 members in the Senate, and 91 in the House, each of whom receives \$5.00 per day. There are 6 Representatives in Congress. The State government in 1901 was Democratic.

The Judiciary.—The judiciary of the State is elective; the term of office is 15 years. The court of appeals, the highest tribunal, consists of eight judges, seven of whom are the chief judges, respectively, of the seven judicial districts into which the State is divided, and one from Baltimore. The governor designates the chief judge. The judicial system of Baltimore is regulated differently from that of the counties. The judiciary is composed of eight judges, constituting the supreme bench of the city.

MARYLAND

Religion.—The strongest denominations in the State are Roman Catholic; Methodist Episcopal; Protestant Episcopal; Lutheran, General Synod; African Methodist; Methodist Protestant; Reformed; Methodist Episcopal, South; Presbyterian, North; and Regular Baptist, South. In 1900 there were reported 2,531 Evangelical Sunday Schools, with 32,903 officers and teachers, and 206,156 scholars.

Charities and Correction.—There is a Board of State Aid and Charities appointed by the governor. The State Insane Asylums are at Sykesville and Spring Grove. The State Penitentiary is located at Baltimore; also the House of Refuge for Boys, Saint Mary's Industrial School for Boys, Female House of Refuge, the School for the Blind, and School for the Colored Blind and Deaf, the State House of Correction for minor offenses against the law, located in Anne Arundel County, a State institution for education of the deaf and dumb in Frederick city. The Shepherd Asylum for the Insane, near Baltimore, established by Moses Shepherd.

Education.—In 1694, Governor Nicholson, the second royal Governor appointed by William and Mary, who had assumed the government of the Colony, established at Annapolis King William's College, which after the Revolution was changed into St. John's College, under which name it still exists. In 1750 Rev. Thomas Bacon established a manual training school in Talbot County, believed to be the first of the kind in the United States. In 1770 Eden Hall School was founded in Worcester County, and in 1784 Cokesbury College, under the patronage of the Methodist denomination, was established in Cecil County. In 1774, Charlotte Hall School was established under State authority, and still is a beneficiary of the State. In 1784, Washington College was founded at Chestertown, Kent County. The Western Maryland College for the education of the youth of both sexes was established in 1868 in Westminster, Carroll County. It receives an annual donation from the State of \$1,800. Under a series of acts of the General Assembly of the State, passed from time to time in compliance with the requirements of Art. VIII. of the Constitution of 1867, there has been gradually evolved the present excellent and uniform system of free public schools, with a State superintendent at its head, throughout the State, maintained by an adequate revenue raised by general taxation. In 1903 the expenditure for this purpose was \$734,683.05.

The fund thus raised is distributed by the comptroller among the counties and city of Baltimore, according to population. By an act passed in 1896, books for the pupils of the public schools are furnished free, and an annual tax is levied to meet this expenditure, which is \$150,000. Colored schools are maintained throughout the State at the public expense, and they share in the distribution of the school fund equally with the whites. In 1903, there were 2,357 schools in the State and 176 in Baltimore.

The Maryland Agricultural College, under the patronage of the State, is located in Prince George's County. While especially established for the education of youth in scientific agriculture, it gives tuition in other branches of knowledge, and in some of the mechanic arts. Attached to it is an experimental farm conducted

on a large scale. It has an annual donation of \$9,000 from the State. There is also an agricultural school for colored youth, supported in part by the State.

The public school system of the city of Baltimore is separate and distinct from that of the State. It was begun in 1829 with two schools, three teachers, and 269 pupils maintained by a system of local municipal taxation. In 1902, there were 129 schools in Baltimore, of which 18 were for colored pupils; 1,636 teachers and 66,399 pupils; of these, 10,018 were colored pupils. The amount of expenditure for the support of these schools in 1903 was \$1,401,267. In connection with this system of public schools in Baltimore is a high school or college for advanced pupils, which is authorized to confer academic degrees upon its graduates, and two female high schools, a polytechnic or manual training school, and a kindergarten and a female high school for colored children. The Woman's College of Baltimore City for the instruction of women in the higher branches of learning, established by Rev. John Goucher of the Methodist Church, commands a clientele from nearly every State in the Union. There are in Baltimore four medical schools with hospitals attached; one homoeopathic institute, three law schools, and one dental college. Besides these public institutions there are in Baltimore and in several of the counties of the State private academies of high character and excellence for the education of youth of both sexes, conducted by masters of experience and learning. In 1886 the late Enoch Pratt established in Baltimore the Enoch Pratt Free Library with an endowment of \$1,058,000. The Mercantile Library is supported by private subscription. The Maryland Historical Society, founded in 1844, has a large library attached to it, especially valuable to students of history.

The existing system of public schools was inaugurated under the provisions of the new city charter, adopted in 1898, and is under the control of a board of school commissioners appointed by the mayor and city council. The board selects the superintendent.

Higher Education.—From 1690, the date of an event known in Maryland history as the Protestant revolution, by which the government of the colony was taken out of the hands of the Proprietary and transferred to the king of England, to the American Revolution of 1776, the instruction of Catholic youth by Catholic teachers was prohibited in Maryland by severe penalties. Catholic parents of wealth sent their sons and daughters to France or to the Netherlands for their education; those who could not afford to do this had to content themselves with tutors in their families. The Jesuit missionaries had secretly maintained, notwithstanding the prohibition against them, two schools for boys, one at Whitmarsh, Charles County, and one at Bohemia Manor in Cecil County. The American Revolution emancipated the Catholics of Maryland from the disabilities imposed by these intolerant laws. They were now free to educate their offspring without fear of fine or of forfeiture of property. The Reverend John Carroll, the first archbishop of Baltimore, at once devoted himself to provide for the educational wants not only of the Catholics, but of all others who should choose to avail themselves of the institutions he

established. In this work he had the good fortune to secure valuable aid from an unexpected quarter. The French Revolution had driven into exile a large number of ecclesiastics of the Roman Catholic faith. Many of these had taken refuge in southern Maryland, where they found homes in the Catholic families resident in that part of the State. These gentlemen the Archbishop of Baltimore called to his assistance in this work. Rev. John Dubourg, afterward Archbishop of New Orleans, and of Besançon, France, became president of Georgetown University, founded in 1789, Rev. Francis Nagot, who, on his voyage to this country, had as a companion the celebrated Chateaubriand, became president of St. Mary's College, founded in Baltimore in 1791, and the Rev. John Dubois, afterward first Archbishop of New York, became president of Mt. St. Mary's College, founded near Emmitsburg, Maryland, 1808. Associated with these distinguished ecclesiastics and scholars as professors in these institutions were several of their compatriots and fellow exiles. These gentlemen gave to these seats of learning a distinguished reputation which attracted a great number of students from other States and from other countries. They imparted not only a knowledge of the arts and sciences, but a culture and refinement which left an indelible impression on those who had the good fortune of receiving their instructions. These institutions still remain and carry on the work so auspiciously begun. St. John's Literary Institution was established in Frederick in 1830 by Rev. John McElroy, S. J., and was largely patronized. In 1852, Loyola College was founded in Baltimore by the Jesuits, an order which has a world-wide fame as educators of youth "in virtue and learning," to quote the language of an Act of the Colonial Assembly of 1671.

The celebrated Mrs. Eliza Seton, foundress of the Sisters of Charity in the United States, established a school near Emmitsburg for the education of women, in 1809. The Order of the Visitation established female schools in Georgetown, Baltimore, and Frederick; the Carmelites in Baltimore, and the Sisters of Notre Dame in Baltimore City and Baltimore County. The Christian Brothers began their great work in primary education in Baltimore, 1845. In 1875, Johns Hopkins University, named after its munificent founder, John Hopkins, was established in Baltimore. Though the youngest of our great universities, it has attained a distinguished rank among the great seats of learning of our country, and enjoys a high reputation abroad. The Johns Hopkins Hospital, connected with the Johns Hopkins University, is the medical department of that institution. It was endowed by the same generous benefactor. It is located in the eastern section of Baltimore, and the buildings cover several acres of ground. The members of its faculty occupy a high rank in the medical profession for their scientific attainments and experimental knowledge. In 1867 George Peabody founded in Baltimore the Peabody Institute, Library, and Conservatory of Music. The library furnishes unequalled facilities to students and scholars in the prosecution of original investigation. The Maryland Institute for the promotion of the mechanic arts was established in Baltimore in 1847.

Provincial History.—Maryland was settled by a body of Englishmen under the auspices of Cecilius Calvert, the second Lord Baltimore and the first Lord Proprietary of the Province, under a charter granted to him by Charles I. on 20 June 1632. The charter was originally intended to be granted to Sir George Calvert, the first Lord Baltimore, and father of Cecilius; but that nobleman dying on 15 April 1632, after the charter had been drawn up, but before it passed the great seal, it was issued to Cecilius, his eldest son, the heir to his title and estates, and also to his schemes of colonization in America. In deference to the request of the king the name of Terra Mariæ, the land of Mary, was given to the province, after the name of his queen, Henrietta Maria, the daughter of Henry IV. of France. Sir George Calvert (q.v.), as the author of the charter, and the projector of the Province of Maryland, may be regarded as its real founder. When he arrived in Virginia he had reason to anticipate a civil, if not a cordial, reception from the authorities and people of the colony on the brief visit he proposed making. He was promptly met by a Dr. Pott, who, in the absence of the Governor, Sir John Harvey, was acting in that capacity, and the council, with a tender of the oath of supremacy, which as a Catholic he could not take, and which it was known he could not take, and which they had no authority to require of him. He declined to take the oath, and leaving Lady Baltimore and his family in Virginia, he sailed for England. On his arrival he applied for a charter and a grant of land north of the Potomac. The application was successful notwithstanding the opposition of the agents of Virginia in London, among whom was William Claiborne, of whom we are to hear more directly. But before the charter passed the great seal, Sir George Calvert, the first Lord Baltimore, died, leaving his eldest son, Cecilius Calvert (q.v.) his heir and who was to become first Lord Proprietary of the Province of Maryland. Cecilius zealously proceeded to execute his father's wishes and to carry out his plans for colonization under the charter. In this he was greatly delayed and hampered by the agents of the Virginia colony in London. They insisted on their objections to the charter, but on appeal to the Lords Commissioners of Plantations, that body in July 1633 overruled the objections and decided in Lord Baltimore's favor, and recommended to both parties the cultivation of friendly relations and good correspondence between them. This recommendation Cecilius Calvert always evinced, both by his instructions to the governor and authorities of his Province, and in his own conduct, a desire to pursue; but his efforts in that direction met with no response on the part of the Virginia colonists.

The main and principal objection urged by the Virginians to the Baltimore Charter was that it was an invasion of their chartered rights. At the time of the grant of the Maryland charter, Virginia had no chartered rights. The charter of the London or Virginia Company had been vacated and annulled by a judgment of the King's Bench on a quo warranto proceeding, instituted for that purpose, in 1624, eight years before the Baltimore grant was issued. Their objection on this ground was therefore wholly untenable. For, whatever may be said of the

MARYLAND

merits or demerits of that judgment, its legal effect to invest in the crown all right and title to the land granted in that charter to the company, and all civil and political authority and jurisdiction conferred on the corporation, could not be questioned. Virginia thenceforth became a royal colony, and the right of the crown to carve out of the territory, thus resumed, any grants of land it chose to make, and to invest the grantees with any civil or political authority it chose to bestow, could not be questioned. The judgment being that of the highest court in England was final and conclusive.

Nor were the inhabitants of Virginia at the time ill pleased with being relieved by that judgment of a government by a corporation, and erected into a royal colony. In 1643, when the question of a restoration of the charter of 1609 was agitated, the House of Burgesses of Virginia unanimously adopted and sent to the Committee on Plantations of the Privy Council an earnest remonstrance against the proposal, and nothing more was heard of it.

The boundaries of Maryland as laid down in the charter are as follows: Beginning at a point on the Eastern Shore of the Chesapeake Bay, known as Watkins Point, and running thence easterly to the ocean; then by the ocean and Delaware Bay unto the fortieth parallel of latitude; thence by that parallel west to the true meridian of the first fountain of the Potomac; thence verging toward the south unto the farther bank of the said river, and following the same on the west and south to the mouth of said river; and thence across the bay to the place of beginning. On comparing the boundaries set forth in the charter with the present limits of the State, it will be seen that Maryland has suffered a very considerable curtailment of the territory granted by the charter. The charter limits embraced the present State of Delaware, a strip of southern Pennsylvania 15 miles in width and 150 miles in length, embracing the site of Philadelphia; and the valley between the north and south branches of the Potomac River; constituting an area equal in extent to one third of the existing territorial area of the State. Against these flagrant encroachments on their territory both on the north and the south, Cecilius Calvert and his son and successor, Charles, offered strong but ineffectual protest and resistances, owing to the disturbed condition of the colony during the greater part of their proprietaryship. The controversy with the Penns in regard to the northern boundary of the province—the 40th parallel of latitude, according to the Baltimore charter—was of long standing, and led to much acrimony between the parties to it, and to actual, but bloodless, conflicts between the inhabitants on the border of the two provinces, Maryland and Pennsylvania. In these conflicts Col. Thomas Cresap, the noted Indian fighter and Revolutionary officer, figured conspicuously on the part of Maryland. The controversy was finally settled in 1762 by a decree of Lord Chancellor Hardwicke in the case of *Penn v. Baltimore*, under which the present boundary line between these States was run and marked by two English surveyors, Charles Mason and Jeremiah Dixon. This line, known as Mason and Dixon's line, subsequently became famous in our political annals as the dividing line between the free and the slave States.

In 1852, the General Assembly of Maryland

passed an Act conceding to Virginia all her right and title to the territory between the north and south branches of the Potomac. In 1877, a joint commission, appointed by Maryland and Virginia, determined the boundary line on the south between these States to be the Virginia or farther shore of the Potomac River at low-water mark; thus conceding the whole river to Maryland as her charter prescribed. The controversy concerning the strip of territory on the western frontier is still open and pending in the Supreme Court of the United States, between Maryland and West Virginia. Of the territory thus granted, the Lords Baltimore were created true and absolute Lords Proprietaries; they were invested with all the regal rights, jurisdictions, prerogatives, privileges, and franchises ever held or exercised by a bishop of Durham in the county of Durham. The Lord Proprietary could establish courts, appoint judges and all the executive officers of the Province from the governor to the constable of the hundred; establish ports; erect manors, and confer on the grantees the manorial rights recognized by English law, including the authority to hold court's baron and courts leet; could coin money; could appoint the members of the Governor's Council, which in time became the upper House of the General Assembly; could initiate all rules and ordinances for the government of the colony. Writs and indictments were in his name; he could pardon all crimes save treason. It was in the opinion of historians the most extensive grant of powers and jurisdiction that ever emanated from the English Crown, and made the Proprietary a quasi-sovereign within his domain. It was the grant of a palatinate. The charter was also a constitution of government securing to the colonists their rights as Englishmen.

Cecilius Calvert went zealously to work at once and organized an expedition consisting of about 300 persons, mostly Roman Catholics with their families and servants, and a considerable body of artisans and laborers. The expedition sailed from Cowes on board the *Ark and Dove*, on 22 Nov. 1633, being St. Cecilia's day. Two Jesuit missionaries, Fathers Andrew White and John Altham, accompanied the expedition. After a perilous voyage of four months, the colonists reached the mouth of the Potomac, and landed on an island they named Saint Clements, on 25 March 1634, the feast of the Annunciation of the Blessed Virgin Mary, and, according to the method of reckoning time then prevailing, the first day of the New Year. They erected a rude cross, and the Jesuit Fathers celebrated mass, and in the name of the King and of the Lord Proprietary, the colonists took possession of their new homes. Leonard Calvert, the brother of Cecilius, the commander of the expedition and the first governor of the Province, purchased from a tribe of Indians on the mainland a village and 30 square miles of contiguous territory. Here he established his capital and called it Saint Marie's. The colonists cultivated friendly relations with the aborigines, relations which were maintained almost uninterruptedly for the first 50 years of the colony's existence. The colonists erected a governor's house and a guard house, cultivated Indian maize, planted orchards and gardens, and soon Saint Marie's blossomed like a rose in the wilderness. But evil days were in store for them.

MARYLAND

William Claiborne, a member of the Virginia colony, and one of their agents in London, in opposing the grant of Maryland to Lord Baltimore, had while in England on that errand, obtained from Sir William Alexander, the secretary of state for Scotland, a license to trade to Nova Scotia, of which Alexander had acquired a grant. On his return to Virginia, he supplemented that license by another from the governor and council of Virginia to trade with Manhattan, the Dutch settlement, and New England. These were simple licenses to trade and contained no grant of land whatever. To facilitate his trade, he established a trading post on Kent Island in the Chesapeake Bay and within the limits of the grant about being made to Calvert. Lord Baltimore instructed Governor Calvert to require of Claiborne an acknowledgment of his authority, assuring him protection and security in whatever just rights he possessed. This Claiborne refused to do, and was supported in his refusal by the governor and council of Virginia to whom he referred the demand for advice. A controversy arose speedily ending in a conflict between the forces of Governor Calvert and an armed pinnace commanded by one of Claiborne's men. In this conflict lives were lost on both sides. Thus for the first time was American soil stained by English blood shed by English hands. Claiborne finally took refuge in Virginia, and Kent Island acknowledged the authority of the Lord Proprietary. The lords commissioners of plantations in 1638 ignored, on appeal, Claiborne's pretensions and sustained Lord Baltimore. One Richard Ingle, who seems to have had some connection with Claiborne, afterward invaded the Province with an armed force, took Saint Marie's, which he partially destroyed, compelled Governor Calvert to fly the province, and carried on for some time a general pillage of the inhabitants. Governor Calvert gathered a sufficient force of the colonists and compelled Ingle to desist from his piratical excursions and leave the Province.

The colony was now at peace, and owing to the genial climate, the fertile soil, favorable conditions of plantation, and the mild, tolerant and beneficent sway of the Proprietary and his government, it quickly attracted settlers and the population grew apace. This happy and prosperous condition of things continued for some years. In 1643 a colony of Puritans who had settled in Virginia, were expelled by the authorities of that colony for non-conformity in their religious worship with the Church of England. They took refuge in Maryland and solicited and obtained from the governor a large tract of land on the Severn where they made a settlement and named it Providence.

In 1650 they availed themselves of the Revolution in England, by which the government in church and state was overthrown by the Protector Cromwell, to start a revolution of their own in the Province alleging as the grounds therefor that their consciences would not permit them to swear allegiance to a Catholic proprietary, or to allow the celebration of the mass and of the rites of a Catholic Church where they could prevent them, and they accordingly set up a government of their own. Governor Stone, who had succeeded Leonard Calvert, himself a Protestant and a sympathizer with the Parliamentary party in England, marched with a force to put down

the revolt. He was defeated by the Puritans, himself and several others captured. The commander of the Puritans organized a drum-head court-martial, condemned Governor Stone and the prisoners to death, and did execute four of them. Governor Stone was saved by the refusal of the soldiers to execute the order of their commander for his assassination. The rebels then appealed to Cromwell for the ratification of their acts. The Protector sustained them in the usurpation of the government of the Proprietary, but refused to sanction their attempt to rob him of his property. On the restoration of Charles II. to the throne, the usurpation ended and the Lord Proprietary's government was re-established. Cecilius Calvert died in 1675, and was succeeded by his son Charles, the third Lord Baltimore and the second Proprietary of the Province. Cecilius has expended £40,000, a very large sum for that period, on the colony, and his rule had been marked by singular good sense, practical judgment, a liberal and enlightened policy on the subject of religious freedom, care and solicitude for the rights and interests of those one might call his subjects. Charles followed generally the example of his father in the government of the colony. Full representative government became firmly established, the governor and his council constituting the Upper House and delegates elected from the counties forming the Lower House of the Assembly. Between these Houses there was occasional friction on the subject of taxation, the dues claimed by the Lord Proprietary and the administration of the affairs of the land office by his lordship's agents.

In 1680, on the occasion of the expulsion of James II. and the accession of William and Mary to the throne of England, there occurred in the Province what is known as the Protestant revolution. The government of the colonies was taken out of the hands of Charles, Lord Baltimore; but his proprietary rights were not disturbed; although efforts to do so were made by some of the inhabitants. In 1715, on the death of Charles, Benedict Leonard, his son, succeeded both to the governmental authority of the colony as well as to his proprietary rights, Benedict having become a member of the Church of England. Benedict lived but a few months, and was succeeded by Charles II., and fifth Baron of Baltimore, who, dying 24 April 1751, was succeeded by Frederick, the sixth Lord Baltimore and the fifth Lord Proprietary. Frederick died in 1771, leaving no legitimate offspring. He devised the Province by will to his natural son, Henry Harford, who was the sixth and last Proprietary of Maryland. The American Revolution in 1776 terminated forever all royal authority as well as proprietary rule over Maryland.

State History.—Under the 16th section of the charter to Cecilius Calvert, Maryland enjoyed a special exemption from all taxation by the British government. But she promptly cast in her lot with her sister colonies in the struggle for independence. She sent 20,000 of her best sons to the Continental army under Washington, who distinguished themselves by their gallantry and good conduct. While Maryland by her delegates participated in the deliberations of the Continental Congress and answered its requisitions for men and money, she persistently declined signing the Articles of Confederation

MARYLAND

until the States of Virginia, Massachusetts, Connecticut, New York, North Carolina and Georgia, which claimed the territory west of the Alleghany Mountains, should surrender that territory and all claim and title to it, whether well or ill founded to the United States in Congress assembled, to be held by that body as the common patrimony of all the states, and to form in time, in the language of the resolution of her General Assembly, "free, convenient and independent states." This surrender was ultimately made, and Maryland signed the articles on 1 March 1781. Thus was a National public domain secured to the United States. It was for the government of this territory that the celebrated ordinance of 1787 was framed.

Maryland was the seventh State to join the American Union under the existing Constitution of the United States. She ceded in 1790 to the United States the territory on which Washington, the capital of the Nation, now stands. In the War of 1812 Maryland was the theatre of extensive military and naval operations on the part of Great Britain against the United States. A large force of British troops under the command of General Ross, supported by a fleet operating in the Bay and the Potomac River, and commanded by Admiral Cockburn, invaded Maryland, captured Washington, destroyed the public buildings, including the Capitol, and then marched to the capture of Baltimore. The Maryland troops under Gen. Smith and Gen. Stricker met the British troops at North Point, 12 miles from Baltimore City and defeated them with the loss of their commander, and the simultaneous attack by the British fleet on Fort McHenry that defended the entrance to the city by water, was repulsed. It was during this engagement between the fleet and the fort, that Francis Scott Key, who was on board the British fleet as a prisoner, wrote the National anthem, the "Star-Spangled Banner." Had Baltimore been captured, Philadelphia, the next point of attack, would probably have fallen. A column of British troops would have entered the North from Canada, and have effected or attempted to effect, a junction with the victorious British army, while the Western frontier, from the Lakes to the Gulf, would have been aflame with an insurrection of the hostile Indian tribes instigated by British emissaries. The defeat at North Point and Fort McHenry frustrated this dangerous scheme. Maryland sent several regiments to the Mexican War, and many of her sons fell on the field of honor while gallantly leading their regiments. During the Civil War sentiment in Maryland as in the other border States, was divided. But while a majority of her citizens sympathized with the South, the State did not secede. Many of her sons joined the Confederate army, while others enlisted in the Federal regiments. Since Maryland became a State she has had four constitutions; one adopted in 1776, one in 1851, one in 1864, and the last and present one adopted in 1867. In the year 1880, Baltimore (q.v.) celebrated its 150th anniversary with a week of festivities, and in 1884 the 250th anniversary of the landing of the colonists was celebrated. In 1891, a monument was erected to Leonard Calvert, the first governor, on the site of the old city of Saint Mary's, the first capital of the State, of which scarcely a trace remains.

Religious Toleration in Maryland.—The subject of religious toleration in Maryland has given rise to much discussion and controversy as to its origin, and to whom belongs the honor of originating it. The fact that religious freedom prevailed in the colony from its foundation in 1634 to the Protestant revolution in 1690 with a brief interruption during the Puritan usurpation in 1650-60, is not denied. During this period there was no established church, no taxation for the support of one, no compulsory attendance on its services. There was perfect equality before the law for all Christian denominations. After that revolution, in 1692, the Church of England was established by an act of the Provincial Legislature, although the members of that Church were greatly outnumbered by Roman Catholics, Dissenters and Quakers. By this act conformity with its worship, and the use of the Book of Common Prayer in every chapel or place of worship in the Province, were prescribed; and an annual tax of 40 pounds of tobacco was levied on all the inhabitants for the support of the Church. In 1702, Presbyterians, Quakers, and other non-conformists were relieved of some of the disabilities and burdens imposed by the act, but those imposed on Catholics remained. The penal statutes of England against the profession and practice of the Roman Catholic faith were made operative in Maryland by several acts of the General Assembly of the province, especially by the act of 1718, which incorporated bodily into the legislation of the colony the proscriptive statutes of 11 and 12 William III. Under this intolerant legislation several Roman Catholic families left the Province and took refuge in Pennsylvania, under the milder rule of the Penns; and in 1750 Charles Carroll, grandfather of the Carroll of Carrollton, went to France to obtain from Louis XV. a grant of land in the Louisiana territory to which to remove the Roman Catholics of Maryland as a body. In this he did not succeed and the Catholics remained in the province. This religious intolerance continued to the period of the American Revolution.

Some writers have attributed this early toleration to the charter of Charles I. to Cecilius Calvert, and have therefore attributed the honor of originating it to that monarch, the friend of Laud and Strafford, and during the early part of whose reign Roman Catholics and non-conformists were equally proscribed. The statement of this claim on behalf of Charles I. bears its own refutation. Besides, the charter remained the fundamental law of the Province during both the tolerant and intolerant periods of its history, and it gave no shield or protection to the Roman Catholics persecuted for their faith during the latter period, or during the brief regime of the Puritans in 1650-60. It is plain, therefore, that the honor does not belong to Charles I. and that toleration is not to be found in the provisions of the Charter.

The originators of this liberal and enlightened policy of religious toleration were Sir George Calvert and his son Cecilius, and to them and to them only, belongs the honor of its origin. When Sir George visited his Province of Avalon in Newfoundland in 1627-8, just after his conversion to the Roman Catholic Church, he erected a Roman Catholic Chapel and a Protestant place of worship at the same time, and secured for the latter the ministrations of one

MARYLAND

Rev. Erasmus Stourton. This divine, on his return to England, lodged an information against Lord Baltimore for permitting the celebration of the mass in his colony. If prosecuted, this charge would have subjected Calvert, under the law of England, to a heavy fine, one half of which would have gone to the Reverend informer, and to imprisonment. But owing perhaps to the favor of the king, or to the influence of powerful friends at court, the prosecution came to naught.

Cecilus Calvert was 19 years of age, when, with his father and family, he became a Roman Catholic. The change of faith of father and son in the face of the intolerant laws and the still more intolerant sentiments of the times, furnish indisputable testimony to the sincerity of their convictions. They sacrificed station, honors, offices. Both had been conscientious Protestants; they were now become equally conscientious Roman Catholics. No two men in England were so capable as this father and son, to feel and realize by their experience—and their observation, as well—for it was the era of the Thirty Years' war with all its horrors—the wrong, the injustice, the folly and the crime of religious persecution; and they resolved that in any colony where they should hold sway, they would have none of it. This noble resolve Cecilus afterward faithfully and religiously adhered to throughout his long and eventful career, as Lord Proprietary, notwithstanding strong provocations and the free hand he had to abandon this enlightened and liberal policy he inaugurated in Maryland, if he had chosen to do so; certainly as to the large body of dissenters and non-conformists with the Church of England.

In his first instructions for the government of the Colony, given to his brother Leonard on the sailing of the expedition, he enjoined this policy on him, and repeated this injunction in subsequent instructions. These instructions Leonard, sharing no doubt the sentiments of his father and brother, faithfully carried out in his able administration of the affairs of the Province.

In 1649, Lord Baltimore, exercising his right under the charter to initiate legislation, sent to Governor Calvert a body of sixteen laws to be submitted to, and enacted by, the Assembly. Among them was the celebrated Toleration Act of 1649. If not actually drawn up by Lord Baltimore himself, this Act was drawn up at his dictation. The Roman Catholic phraseology of some of the names used, and the identity of the language with that of the instructions previously sent out by him on this subject, leave no doubt on this point. "Whereas," is the noble preamble to this Magna Charta of religious liberty, "the enforcing of the human conscience in matters of religion hath frequently fallen out to be of dangerous consequence in those commonwealths, in which it hath been practised, and for the more quiet and peaceable government of this Province, and the better to preserve mutual love and amity amongst the inhabitants thereof, be it enacted that no person or persons whatsoever, within this Province professing to believe in Christ Jesus, should, from henceforth, be in any ways troubled, molested or discountenanced for or on respect of his or her religion, nor in the free exercise thereof, nor in any way compelled to the belief or exercise of any other religion against

his or her consent." For any violation of this act, a fine was to be imposed and the offender was made liable to a civil suit for damages at the instance of the party injured. The act did not long remain on the statute book. When the Puritans overthrew the Proprietary's government in 1650, they convened a new Assembly. To this Assembly Roman Catholics were declared to be ineligible, and were not allowed to vote for members of it. The first thing this Assembly did was to repeal the act of 1649, and to pass one in lieu of it, which contained this provision, "That, none who profess and exercise the Papistic religion, commonly known by the name of the Roman Catholic religion, can be protected in this Province, by the laws of England, formerly established and yet unrepealed, nor by the government of the commonwealth of England. But are to be restrained from the exercise thereof;" of which all persons concerned were required to take notice. By a subsequent clause of this act it was provided "that all persons who professed faith in Christ Jesus . . . shall not be restrained . . . provided that this liberty shall not be extended to popery or prelacy." This excluded Roman Catholics and Episcopalians. The contrast between the acts of 1649 and 1654 is striking. On the restoration of the Proprietary to his government in 1660, the first thing done was to repeal this law and put the act of 1649 again on the statute book; and there it remained until, as a result of the Protestant revolution in 1690, it was again repealed and followed by a body of severe and stringent laws against Roman Catholics, which made the Proprietary himself as long as he remained a Catholic, and the Catholic Colonists the only outlaws for conscience sake in a Province, opened by their liberality to the professors of every Christian Creed. This condition of things continued until 1776. In the Declaration of Rights which prefaced the first Constitution of the State of Maryland adopted in that year, the principle of religious liberty announced for the first time in 1649 was enlarged and proclaimed as the inalienable right of the citizen, and a part of the fundamental law.

Population.—Maryland had a population in 1790 of 319,728; (1850), 583,034; (1870), 780,844; (1890), 1,042,390; (1900), 1,188,044. In 1900 the negro population was 235,064; foreign born, 93,834. The principal cities are Baltimore (pop. 508,957); Cumberland (17,128); Hagerstown (13,591); Frederick (9,296); and Annapolis (q.v.) 8,525.

The Press.—There are six daily papers published in Baltimore: 'The Sun,' established in 1837; 'The American,' established in 1794; 'The Herald'; 'The German Correspondent'; 'The Daily Record,' morning papers; 'The News'; 'The World,' afternoon papers; three weekly papers, 'The Catholic Mirror'; 'The Methodist Protestant,' and 'The Telegram.' Every county town has two newspapers.

MARYLAND CAMPAIGN OF SEPTEMBER 1862

Maryland Campaign of September 1862.

The Union army under Gen. Pope having been defeated and driven to the defenses of Washington, Gen. Lee, 3 Sept. 1862, marched from Chantilly for Leesburg. At the end of the first day's march Lee wrote to Jefferson Davis that the time seemed propitious "for the Confederate army to enter Maryland" and give her material aid in the recovery of her liberties. The next day he reached Leesburg, and again wrote that he was fully persuaded of the benefit that would result from an expedition into Maryland, and should proceed at once to make the movement, unless it was disapproved; also that he proposed to enter Pennsylvania, unless it should be deemed inadvisable upon political or other grounds. Without waiting for a reply to his two communications he crossed the Potomac at White's Ford, near Leesburg, on the 4th, 5th, and 6th, with an army of over 60,000 men, and marched to Frederick, Md., where, on the 8th, he suggested to President Davis that the position of affairs "placed it in the power of the government of the Confederate States to propose with propriety to that of the United States the recognition of our independence." On the same day he issued an address to the people of Maryland, stating his mission among them and that he was prepared to assist them in regaining the rights of which they had been despoiled. When Lee entered Maryland east of the Blue Ridge he took it for granted that the Union garrison at Harper's Ferry would be withdrawn, thus opening his line of communication through the Shenandoah Valley. This was not done, and it became necessary to dislodge the garrison from that post before concentrating the Confederate army west of the Blue Ridge, and Lee came to the decision to divide his army and capture the Union forces at Martinsburg and Harper's Ferry. On the morning of the 10th his army was put in motion from Frederick. Walker's division of two brigades crossed the Potomac at Point of Rocks, south of Harper's Ferry, and on the morning of the 13th established itself on Loudoun Heights: Jackson, with 14 brigades, marched over South Mountain at Turner's Gap, crossed the Potomac at Williamsport on the 11th, drove Gen. White from Martinsburg into Harper's Ferry (q.v.), and at noon of the 13th appeared before Bolivar Heights and invested Harper's Ferry from the Virginia side of the Potomac. McLaws, with ten brigades, marched over Brownsville Gap of the South Mountain, crossed Pleasant Valley, and on the evening of the 13th was in full possession of Maryland Heights (q.v.), thus completing the investment of Harper's Ferry and its garrison of over 12,000 men. Gen. Lee, with nine brigades of Longstreet's command and D. H. Hill's division of five brigades, followed Jackson over South Mountain, leaving Hill near Boonsboro to support Stuart's cavalry, which had been left east of the Blue Ridge. Lee, with Longstreet, moved to Hagerstown, there to await the capture of Harper's Ferry, and then to concentrate his army for a movement into Pennsylvania, the capture of Harrisburg, and the destruction of the long railroad bridge over the Susquehanna. Meanwhile Gen. McClellan, who had been placed in command of the Union troops for the defense of Washington, took the field at the head of over 87,000 men, and marched against Lee. His army, spread out

like a great fan, its left on the Potomac and its right on the Baltimore & Ohio railroad, cautiously advanced on Frederick, which was occupied on the 12th, and here McClellan found a copy of Lee's orders, showing the disposition of his scattered command. Tardy pursuit began, on the morning of the 13th Franklin's Sixth corps and Couch's division were put in motion to carry Crampton's Gap, in South Mountain, and relieve the garrison in Harper's Ferry, while McClellan, with the rest of the army, marched for Turner's Gap, six miles north of Crampton's, to cross the South Mountain and attack Lee. Franklin defeated the Confederates at Crampton's Gap on the 14th and, passing into Pleasant Valley, interposed between McLaws and Lee. Burnside, with the First and Ninth corps, attacked D. H. Hill at Turner's Gap and Fox's Gap the same day, Lee retraced his steps from Hagerstown to reinforce Hill, but when night came Lee had suffered defeat. He now abandoned his intention of invading Pennsylvania, ordered McLaws to elude Franklin and recross the Potomac somewhere south of Shepherdstown Ford, and at 10 o'clock that night put his own command in motion to recross the Potomac at Shepherdstown Ford, at the same time sending an order to Jackson to march from his investment of Harper's Ferry up the south side of the Potomac to Shepherdstown and cover the crossing. He crossed the Antietam in the morning of the 15th, where he hoped that McLaws might join him, but Franklin confined McLaws in Pleasant Valley. At noon he heard that Jackson had captured Harper's Ferry, whereupon he concluded not to retreat across the Potomac, but to give battle to McClellan on the heights and banks of the Antietam, and ordered Jackson to join him as soon as possible. McClellan followed Lee on the morning of the 15th, defeated Fitzhugh Lee's cavalry brigade in the streets of Boonsboro, and in the evening reached the banks of the Antietam to see Lee's army drawn up on the heights beyond. Franklin was left in Pleasant Valley to watch McLaws and relieve Harper's Ferry. Jackson joined Lee on the morning of the 16th, bringing Walker's division with him; McLaws eluded Franklin, passed out of Pleasant Valley and through Harper's Ferry, and joined Lee very early in the morning of the 17th. The battle of Antietam (q.v.) or Sharpsburg, the bloodiest one-day battle of the war, was fought on the 17th: both armies remained inactive on the 18th, and that night Lee re-crossed the Potomac at Shepherdstown Ford. McClellan followed on the morning of the 19th to the banks of the Potomac. On the 20th a part of Fitz-John Porter's Fifth corps crossed the Potomac at Shepherdstown Ford (q.v.), and was attacked and driven back across the river with great loss. This ended the campaign. From the beginning of the campaign to its close, 5-20 September, the Union losses, including Harper's Ferry and Maryland Heights, were 2,671 killed, 11,766 wounded, and 13,542 captured or missing, an aggregate of 27,979. The Confederate losses were 1,979 killed, 9,607 wounded, and 2,336 captured or missing, an aggregate of 13,922. The results of the campaign were momentous and far-reaching; the Confederate cause lost prestige and the National cause brightened. Recognition of Confederate independence by Great Britain and France, about to be granted, was withheld, and

MARYLAND HEIGHTS — MARYSVILLE

22 September Abraham Lincoln issued his preliminary proclamation of emancipation. Consult: 'Official Records,' Vol. XIX.; 'McClellan's Own Story'; Michie, 'Life of Gen. McClellan'; Palfrey, 'The Antietam and Fredericksburg'; Allan, 'History of the Army of Northern Virginia'; Walker, 'History of the Second Army Corps'; Long, 'Life of Gen. E. A. CARMAN.

Maryland Heights, a bold wooded elevation in Maryland, rising 1,000 feet above the Potomac opposite Harper's Ferry (q.v.), W. Va. In these heights Elk Ridge, lying west of South Mountain, from which it is separated by the narrow Pleasant Valley, terminates. The heights are almost inaccessible, capable of strong defense, and completely command Harper's Ferry, which lies below it in the angle formed by the junction of the Potomac and Shenandoah rivers. When Harper's Ferry was seized by the Virginia forces in April 1861, Col. T. J. ("Stonewall") Jackson promptly occupied Maryland Heights, and they continued in Confederate possession until June of that year, when Gen. J. E. Johnston withdrew from the line of the Potomac and fell back to Winchester. The heights were then occupied by Union troops, and 5 Sept. 1862, when Lee crossed into Maryland they were held by Col. T. H. Ford with about 2,000 men and some heavy siege and field artillery. When Lee, at Frederick, Md., found that Harper's Ferry and the heights were still held by the Union troops, he sent three columns to surround and capture the garrison of more than 12,000 men. Jackson moved from Frederick on the morning of 10 September, crossed South Mountain and the Potomac and, driving everything before him, bivouacked on the 13th near Bolivar Heights. Walker crossed the Potomac south of Harper's Ferry and seized Loudoun Heights. McLaws, with ten brigades, marched from Frederick late on the 10th, camped that night near Brownsville Gap, crossed the gap next day, and on the 12th crossed Pleasant Valley, ascended Maryland Heights, with Kershaw's and Barksdale's brigades, at Solomon's Gap, five miles north of Harper's Ferry, drove in some skirmishers and, marching southward on the crest of the mountain, was checked near nightfall by Ford's men behind a barricade of logs. In the morning of the 13th he renewed his attack, which was stoutly resisted by Ford's men, who meanwhile had been reinforced by troops from Harper's Ferry. The Union troops were finally driven from the heights into Harper's Ferry, abandoning four guns, and at 4:30 P.M. McLaws was in complete possession, and put guns in position commanding Harper's Ferry, whose garrison surrendered on the 15th. The Union loss on Maryland Heights was about 150 killed and wounded; the Confederate loss was 35 killed and 178 wounded. After Lee had been driven across the Potomac the heights were occupied 20 September by troops of the Twelfth corps. The position was strongly fortified, and when, 15 June 1863, Milroy was defeated and driven from Winchester, Gen. French moved his garrison from Harper's Ferry to the heights. Under Gen. Meade's order French abandoned the position and distributed his troops at Fred-

erick and on the line of the Baltimore & Ohio railroad. When Lee was defeated at Gettysburg the heights were reoccupied, 7 July, by the Union forces, and continued in their possession until the close of the War. On 2 July 1864 Gen. Early reached Winchester on his way to menace Washington; Gen. Sigel, who was commanding the Union forces in and around Martinsburg, abandoned his position on the night of the 3d, crossed the Potomac at Shepherdstown, and on the night of the 5th established himself on Maryland Heights, with six regiments of infantry, 2,500 dismounted cavalry, two batteries of heavy artillery, and 26 field-guns, while Gen. Stahel was at Weverton and in Pleasant Valley, with 1,200 to 1,500 cavalry and four guns. Early followed Sigel across the river at Shepherdstown Ford, drove Stahel back and confined Sigel within his works; a heavy cannonade was kept up all night of the 6th, and there was sharp fighting next day; but, making no impression, and unable to maneuver Sigel out of his position, Early drew off and crossed the South Mountain toward Frederick.

Maryland Historical Society. See AMERICAN HISTORICAL SOCIETIES.

Maryland Yellowthroat, one of the most familiar of North American warblers (*Geothlypis trichas*). It is about 5.5 inches in length, migratory, makes a neatly concealed nest on the ground, almost always in a swamp or near a stream, and lays pink-white eggs delicately dotted with red. The plumage is bright yellow above, duller toward the tail; wings and tail greenish; under parts nearly white; and a characteristic jet-black mask across the face and on the sides of the head. The summer cry is a sharp questioning "What of it? Where'd ye get it?" The genus contains several related and similar species.

Marylebone, mā'ri-lē-bōn or mār'li-būn, a metropolitan borough of London, England. See LONDON.

Marysville, mā'riz-vīl, Cal., city, county-seat of Yuba County; at the junction of the Yuba and the Feather rivers, and on the Northern C. and the Southern P. R.R.'s; 52 miles by rail north of Sacramento.

Charles Covilland, a Frenchman, founded Marysville in 1849, after the discovery of gold in California. A trading post named New Mecklenburg had been established some years before. Covilland called the place Yubaville, which name it retained until 1850, when Marysville was adopted, and the following year it was chartered as a city. Its location at the head of navigation and proximity to valuable mines contributed to its growth, so that in 1860 it was the third city in size in the State. Since 1865 it has declined in importance and population.

The chief manufactures are dried and canned fruits, olive oil, flour, cigars, woolen goods, and foundry products. It has considerable trade in the products of the surrounding farms, especially in grains, fruits, sheep, wool, and cattle. The mines of the vicinity contribute to its industrial wealth. The city is the seat of the College of Notre Dame (R. C.) for women, public and parish high schools, and it has a fine public library. The city hall and court-house are handsome, well-built edifices. Pop. (1855), 8,000; (1890) 3,991; (1900) 3,497.

MARYSVILLE — MASBATE

Marysville, Kan., city, county-seat of Marshall County; on the Big Blue River, and on the Union P. and the St. Joseph & G. I. R.R.'s; about 80 miles in direct line northwest of Topeka. The manufactures are flour, furniture, foundry and machine-shop products. The city has considerable trade in wheat, corn, fruit, and live-stock. Pop. (1900) 2,006.

Marysville, Ohio, village, county-seat of Union County; on Mill Creek, and on the Cleveland, C. & St. L. and the Toledo & O. C. R.R.'s; about 30 miles northwest of Columbus. It is situated in an agricultural region, in which the farm products are mostly wheat, corn, and vegetables. The chief manufactures are dairy products, wagons, carriages, cooperage products, and lumber. There are two libraries, one the public school library, the other a library maintained by the Library and Reading Room Association. Pop. (1890) 2,810; (1900) 3,048.

Maryville, mā'ri-vil, Mo., city, county-seat of Nodaway County; on the Omaha, K. C. & E. and the Kansas City, St. J. & C. B. R.R.'s; about 42 miles north of Saint Joseph. It is in an agricultural region, and in the vicinity is fire-clay. The manufactures are brick, tile, foundry products, lumber, flour, corn-meal, and some dairy products. The trade is chiefly in grain, live stock, brick and tile, flour, and hogs. It is the seat of the Maryville Seminary. The prominent buildings are the county buildings, churches, and schools. Pop. (1900) 4,577.

Maryville, Tenn., village, county-seat of Blount County; on the Knoxville & A. railroad; about 18 miles south of Knoxville. It was settled as early as 1795. It is in an agricultural and stock-raising region, and near valuable marble quarries. Coal is found in the vicinity. The chief manufactures are flour, lumber, woolen goods, and dairy products. It is the seat of the Maryville College (Presbyterian), founded in 1819; the Freedmen's Normal Institute (Friends); and a normal school. Maryville has a fine court-house and some good church buildings. Pop. (1890) 1,686; (1900) 2,000.

Maryville College, an institution in Maryville, Tenn.; founded in 1819 under the auspices of the Presbyterian Church. The school is co-educational, and in 1902 had 16 instructors, over 400 students and about 12,000 volumes in the library. It has a preparatory department and the college course leads to the degree of A.B.

Marzials, mār'zi-älz (Fr. mār-zē-äl), Frank Thomas, English author: b. Lille, France 13 Jan. 1840. He has been accountant-general of the English army from 1898, having entered the War Office during the Crimean War and served therein continuously ever since. He has published lives of Gambetta, Dickens, and Victor Hugo; 'Death's Disguises and Other Sonnets'; etc.

Marzials, Theophile, or Theophilus, English poet: b. Brussels, Belgium, 21 Dec. 1850. He was a pupil in music at London of M. L. Lawson and studied also at Paris and Milan. From 1870 he was employed in the British Museum, where he became superintendent of the department of music. He is best known as a vocal composer ('Twickenham Ferry'; 'Three Sailor Boys'; 'Wait till you Come to Forty Year'; 'Ask Nothing More'); and he also published 'A Gallery of Pigeons and Other Poems.'

Masaccio, mā-sāt'chō, Tommaso, properly **Guidi, gwē'dē**, Italian painter: b. San Giovanni, Tuscany, 21 Dec. 1402; d. Rome 1428. He went while very young to Rome, where he painted in the Church of St. Clemente a series of frescoes, the finest of which represents St. Catherine and the doctors before Maxentius. In 1421 he was admitted into the guild of the Speziali at Florence. Among the works of Masaccio are the frescoes in the Brancacci chapel of the Carmine, the 'Expulsion from Paradise'; 'St. Peter's Sermon'; the 'Tribute'; 'St. Peter Baptizing'; and the 'Raising of the King's Son,' the last of which was partly painted by Filippino. Consult Schmarsow, 'Masaccio-Studien' (1895).

Masai, mā-sī', an East African race, speaking the Hamitic language, and occupying the Lake Kenia district. The Masais are men of large stature and magnificent physique. They are a warlike people and live mostly in military kraals, eating nothing but beef and drinking nothing but milk. The labor is done by slaves, women and children.

Masaniello, mā-sā-nē-ēl'ō, the commonly received name of **TOMMASO ANIELLO**, Italian revolutionist: b. Amalfi 1623; d. Naples 16 July 1647. He was a fisherman at Sorrento, and in 1647 roused and led an insurrection against the Spanish viceroy, the Duke of Arcos. He was successful, and obtained the abolition of unjust taxes and the revocation of an order to establish the Inquisition at Naples. But the people soon rose against him, too, and he was assassinated. An opera, music by Auber, libretto by Scribe and Delavigne, based on his career, was presented in 1828 at Paris, as 'La Moette di Portici,' and in 1829 in England in English as 'Masaniello.'

Masaya, mā-sī'ā, Nicaragua, town, in the western part, about 12 miles north of Lake Nicaragua and near Masaya Volcano, which is 3,000 feet in height. The town is connected by railroad with the cities of Leon, Managua, and Granada. Masaya is situated in an agricultural region, of which tobacco is one of the principal productions. The inhabitants are mostly Indians. Pop. 18,200.

Masbate, mäs-bä'tā, Philippines, an island of the Philippines in the eastern part of the Visayan Sea, south of Luzon and northwest of Samar; greatest length 82 miles northwest to southeast; width 45 miles; area, 1,230 square miles. It is very mountainous, the central chain being semicircular in shape, extending from southwest to southeast; and there are several rivers of considerable size. Communication between towns and villages is mostly by water, as there are few roads or even trails. The staple products are sugarcane, cotton, chocolate and hemp; tobacco of a strong quality is also raised. One of the chief industries is that of stock-raising (cattle, horses and hogs); over 1,000 head of cattle are ordinarily shipped monthly to other parts of the Philippines, mostly to Manila. Other important industries are the manufacture of sugar sacks from the buri palm, the manufacture of palm mats of superior workmanship and coloring, weaving, and fishing; there is also an active trade with Manila. In March 1901 the island was united with Ticao (140 square miles), Burias (258 square miles),

MASBATE — MASHONALAND

and the small adjacent islands, to form the province of Masbate; area of the whole province 1,732 square miles. In December 1901, the provincial governor reported general satisfaction with the government and unusual industrial activity. Pop. of province 23,069; Masbate and Ticao (q.v.) 21,366.

Masbate, Philippines, a pueblo and the capital of Masbate province, situated in the northeastern part of the island of Masbate on a peninsula dividing Palánog Port from Mobó Bay. It is a port of entry, and has a considerable trade. It has a church, a school, and some well constructed buildings. Pop. 2,400.

Mascagni, Pietro, pē'ā-trō mäs-kän'yē, Italian composer: b. Leghorn, Tuscany, 7 Dec. 1863. He was educated at the Milan Conservatoire and in 1890 his opera 'Cavalleria Rusticana' brought him immediate recognition in the musical world. His songs and ballads are popular and his successful career as a composer has been further aided by his operas: 'L'Amico Fritz' (1891); 'Les Rantzau' (1893); 'Iris' (1898); etc. In 1902 he visited the United States on an operatic tour.

Mascagnite, mäs-kän'yit, or **Mascagnine**, a native sulphate of ammonium, occurring notably at Sasso in Tuscany, where it was discovered by Mascagni, from whom it was named.

Mascarene (mäs-ka-rēn') Islands, a collective name for the islands of Bourbon, Mauritius, and Rodriguez, named after Mascarenhas, a Portuguese navigator, who discovered Bourbon in 1545.

Mas'cots and Hoodoos, a mascot is a person or thing supposed to bring good luck, while a hoodoo is an influence of evil. Another name for the hoodoo is Jonah, a term originating with superstitious sailors. The word mascot was first introduced into literature by means of the comic opera 'La Mascotte' written by Audran, but in France it appears to have been in common use for a long time previously among gamblers and sporting characters. It was used to signify some object, animate or inanimate, which like the luck-penny, brought good fortune to its possessor. The word is traced back to the *patois* of Provence and Gascony, where a mascot is something which brings luck to a household. Etymologically the word is derived from masque (masked or concealed), which in provincial French is applied—as *né coiffé*—is in more polished French—to a child born with a caul. Such a child was believed to be destined, not only to be lucky himself, but to be the source of luck to others. In most European countries there is a large trade in charms and talismans to bring good fortune.

The term hoodoo is a manifest corruption of African voodooism and is a modified superstition of the system of terrorism which has been cultivated for years by the voodoo priesthood with remarkable success. There is, however, no scientific foundation for belief in either hoodoos or mascots, any more than there is in a reliance upon dreams and visions. Natural laws are not to be set aside by touching a hunchback or carrying a rabbit's foot in one's pocket. It is a fact, however, that in every age of the world the goddess of chance has been worshipped under one name or another, and modern civilization has not destroyed this cult. The belief in the mascot

for luck, or the hoodoo for ill-luck, is an indication of weakness and lack of decision. In the 'Iliad,' when Hector is told that "the birds are against him," and all the omens unlucky, the Trojan hero makes answer: "Without a bird his sword the true man draws; and asks no omen but his country's cause." See also OMENS; SUPERSTITION.

Mascou'ten, a belligerent tribe of Algonquians, the French *Nation du Feu*, "Fire Nation," dwelling along the Illinois River. They were at constant warfare with their neighbors, and are first mentioned by the earliest French missionaries as inhabiting southern Michigan, whence according to the traditions of the Ojibwas and Ottawas, they had been driven by the latter from the region around modern Mackinaw. In 1712 united with the Foxes and Kickapoo, they were almost exterminated, first by the French, and afterward by the Pottawattomi and their allies. The remnants migrated westward, and are last mentioned in 1779 as living with the Piankishaws and Kickapoos on the Wabash River. The name is derived from Mashkodainsug "little prairie people," a title now borne by a tribe of Pottawattomi Indians resident in Kansas.

Mash'am, Abigail Hill, LADY, confidante and favorite of Queen Anne of England: b. London 1670; d. 6 Dec. 1734. A cousin of Sarah Jennings, duchess of Marlborough, and also related to Robert Harley, earl of Oxford, she passed from the service of Lady Rivers, thanks to the influence of the Duchess of Marlborough, into that of Queen Anne, in whose favor she soon displaced her cousin, making every effort to turn the queen from the Marlboroughs and Whiggery to Toryism and even Jacobitism. She was married to Samuel Masham in 1707; had him made a baron in 1712; brought her kinsman Oxford into power, but soon turned him out; and, in short, was the power behind the throne, succeeding her cousin Marlborough. She retired after Queen Anne's death. She was a plain, homely, red-nosed woman, much bepraised by Swift, and accused of vulgarity, meanness, and covetousness by the Whigs.

Mashkodainsug. See MASCOUTEN.

Mashonaland, ma-shō'na-länd, South Africa, a province forming the northeastern portion of South Rhodesia, between the Zambesi and Matabeleland. It consists largely of open plains and table-lands, is well watered by the Umniate and other feeders of the Zambesi, and is very fertile. The Mashonas belong to the Kaffir race, and were formerly masters of the whole territory between the Limpopo and the Zambesi, but were cooped up within their present territory by the powerful Matabele, whom they were unable successfully to resist. They are a peaceful people, clever as smiths and as weavers of cotton fabrics. The country came under the management of the British South Africa Company in 1890. It is rich in gold, which has been mined here at some remote and unknown period, old workings being still visible, and Mashonaland is with some degree of probability identified with the biblical Land of Ophir. Salisbury is the chief town. The population of Mashonaland in 1901 was estimated at 332,750, of whom 4,021 were whites and the rest natives. See RHODESIA.

MASINISSA—MASON

Masinissa, mäs-ī-nīs'a, king of Numidia: b. 238 B.C.; d. 148 B.C. He was at first ruler only of the east portion of the country, but latterly of the whole, having, by the help of the Romans during the second Punic war, defeated Syphax, king of Western Numidia, taking him prisoner with his wife Sophonisba, whose hand had formerly been promised to Masinissa. Masinissa now made her his wife, but Scipio Africanus, fearful of her influence, claimed her as a prisoner of Rome. Unable to resist, Masinissa sent her a poisoned chalice, of which she voluntarily drank. Masinissa commanded the Roman cavalry on the right wing at the battle of Zama, which ended the second Punic war (201 B.C.).

Mask, a covering for the face, often shaped so as to form a rude representation of human or animal features. They have been in use from the most ancient times. Among the Greeks they were used, particularly in the processions and ceremonies attending the orgies of Dionysus. Some ancient masks seem to have been, like the modern ones, merely coverings for the face, but it was more usual for them to cover the whole head, and represent, with the features, the head, hair, and eyes. They were at first made of the bark of trees, then of leather, afterward of wood, which the artist fashioned according to the design of the poet. The comic masks were distinguished by a grotesque laughing countenance; the tragic ones had more dignity, but were sometimes frightful. There were also satyr masks and orchestric, or those with regular features, for dancers. They had mostly very large open mouths, within which were metallic bars or other sounding bodies to strengthen the voice of the speaker—a contrivance which was required by the construction and immense size of the old theatres. The mask used at modern masked balls or masquerades is a covering for the head and face made from a light stuff, with which a person may disguise himself and remain unknown, or perhaps represent some other character. There are whole and half masks—for example, masks for the nose and the eyes. See also CARNIVAL; MASQUERADES.

Mas'kegon (swamp people), a remnant of a tribe of Indians, part of the old Algonquin stock, who formerly lived by hunting and fishing. They are now in the "swamp region" of Canada, between Hudson Bay and Lake Winnipeg, and are classed with the Cree and Ojibwa people. To some extent they are now engaged in lumbering and a few do some farming. The estimated number of Mas'kegons (1903) is 2,000.

Maskelyne, mäs'kè-lin, **Nevil**, English astronomer and mathematician: b. London 6 Oct. 1732; d. Greenwich 9 Feb. 1811. He was educated at Westminster School and at Trinity College, Cambridge; devoted himself to astronomy; and in 1765 was appointed astronomer royal. He made careful studies of terrestrial density, introduced into navigation the method of taking longitudes by lunar distances, and made many improvements in astronomical apparatus.

Mason, mā'sòn, **Alfred Edward Woodley**, English novelist: b. 7 May 1865. He was educated at Oxford and among his works, the most of which have been reprinted in the United States, are: 'A Romance of Wastdale' (1895); 'The Courtship of Maurice Buckler' (1896, dramatized 1897); 'The Philanderers' (1897);

'Lawrence Clavering' (1897); 'Miranda of the Balcony' (1890, dramatized in New York 1901); 'The Watchers' (1899); 'Ensign Knightley'; 'Clementina' (1902); 'The Four Feathers' (1902).

Mason, Amelia Gere, American author: b. Northampton, Mass. She was graduated from Mt. Holyoke and studied music in New York and Boston and in 1872 was married to A. A. Mason of Providence, R. I. She has since spent much of her time in Europe engaged in literary researches, and has published: 'The Women of the French Saloons' (1891); and 'Woman in the Golden Ages' (1901).

Mason, Caroline Atwater, American author: b. Providence, R. I., 10 July 1853. She was educated in Friends' schools and in Germany, and was married to Rev. John H. Mason in 1877. She has published: 'A Titled Maiden'; 'A Minister of the World'; 'The Minister of Carthage'; 'The Quiet King'; 'A Wind Flower'; 'A Woman of Yesterday' (1901); 'The Little Green God,' which has been widely read (1902), etc.

Mason, Charles, English astronomer and surveyor: b. England about 1730; d. Philadelphia Feb. 1787. He was for years assistant astronomer at the Greenwich Observatory and was sent on various expeditions in the service of science. In 1763 he was employed with Jeremiah Dixon to survey the boundary line between Maryland and Pennsylvania and they were engaged in this undertaking until 1767, the line established becoming famous in American history as the "Mason and Dixon's Line" (q.v.). They returned to England and Mason was thereafter engaged in astronomical observations and researches until the time, the precise date of which is not known, when he returned to America. His work upon the lunar tables of Tobias Mayer which were published in London in 1787 under the title 'Mayer's Lunar Tables Improved by Charles Mason,' enjoyed a high reputation for reliability.

Mason, Francis, American missionary and Orientalist: b. York, England, 2 April 1799; d. Rangoon, Burma, 3 March 1874. He was the son of a shoemaker; studied by himself; came to the United States in 1818; worked as a shoemaker through Massachusetts; joined the Baptist Church in 1825; and in 1827 was licensed to preach; sailed for Burma in 1830; and settled in Tavoy, where he worked for 22 years. He was a brilliant linguist; reduced two Karen dialects to writing; and in 1853, upon his removal to Tounoung, published a Karen version of the Bible. He made special study of Pali literature, and of the physical and ethnical peculiarities of Burma, publishing in 1852 'Tenasserim, or the Fauna, Flora, Minerals, and Nations of British Burma and Pegu' (revised 1860). His other works include: 'Life of the Karen Apostle,' a memoir of his wife (1847), and 'The Story of a Workingman's Life, with Sketches of Travel' (1870).

Mason, George, American statesman: b. Stafford (now Fairfax) County, in the "Northern Neck" of Virginia, 1725: d. 7 Oct. 1792. He spent his early life on a typical plantation. The same region produced his co-workers in the cause of the American Revolution, Richard Henry Lee and George Washing-

ton (qq.v.). Mason seems to have been tutored at home, being grounded in a knowledge of the classics, both Latin and English. His younger brother, Thomas, was sent to London to study law at the Middle Temple. George Mason was married in 1750 to Ann Eilbeck, who died in 1773. Of this union there were several children. He was married again in 1780 to Sarah Brent. The family, after 1758, resided at "Gunston Hall," in Stafford County, a famous seat still standing on the banks of the Potomac. His energies were given to extensive planting interests.

As a member of the Ohio company, he was identified with his neighbor, George Washington, in the initial stages of the French and Indian War, growing out of the concerns of that company. In 1759 he entered the Virginia House of Burgesses, at the same time with Washington. He early protested against slavery. In 1765 he wrote: "The policy of encouraging the importation of free people and discouraging that of slaves has never been duly considered in this colony, or we should not at this day see one-half of our best lands in most parts of the country remain unsettled and the other cultivated with slaves; not to mention the ill effects such a practice has upon the morals and the manners of our people." He drafted the "Non-Importation Association," which George Washington presented in 1769 in Williamsburg, and the "Resolves" adopted at a general meeting of the freeholders of Fairfax County, 18 July 1774. These "Resolves" urged "that a Congress should be appointed, to consist of deputies from all the colonies, to concert a general and uniform plan for the defense and preservation of our common rights;" and "that during our present difficulties and distress, no slaves ought to be imported into any of the British colonies on this continent; and we take this opportunity of declaring our most earnest wishes to see an entire stop forever put to such a wicked, cruel, and unnatural trade." Sparks says of these Fairfax resolves that "they constitute one of the ablest and most luminous expositions of the points at issue between Great Britain and the colonies which are to be found among the public documents of that period. Embracing the great principles and facts, clothed in a nervous and appropriate style, they are equally marked with dignity, firmness, intelligence, and wisdom." These "Resolves" served as the basis of the association formed by the Virginia Convention of August, 1774, and that of the general Congress at its first session the following September.

He was a member of the Virginia Convention held in Richmond, July, 1775, which took measures to arm the colony and appointed a committee of safety. He declined appointment in Congress as Virginia's representative in the seat made vacant by Washington's acceptance of the command of the American forces. The mind of Mason was dominant in the Virginia Convention of 1776, so creative in State and National policies. He was the author of the Virginia Declaration of Rights, adopted by the convention on 12 June 1776. (See VIRGINIA CONVENTIONS OF THE REVOLUTION.) A copy of the first draft of this historic paper, in the handwriting of George Mason, is to be seen in the

Virginia State Library. At the foot of the manuscript the author added these words: "This Declaration of Rights was the first in America; it received few alterations or additions in the Virginia Convention (some of them not for the better), and was afterward closely imitated by the other United States." The small table upon which it is believed Mason wrote this "Declaration" is preserved at the Virginia Historical Society in Richmond. Mason's chaste and concise statement of the fundamental principles of free government deserves to rank with the foremost political charters of the English-speaking world. James Madison styles him "The master-builder of the Constitution" of Virginia, adopted 29 June, 1776, the natal day of the commonwealth.

Mason was a member of the Virginia Assembly from 1776 to 1780, and from 1786 to 1788. He was one of the committee to revise the laws of Virginia, in accordance with the changed political conditions. The other members of this committee were Thomas Jefferson, Edmund Pendleton, George Wythe, and Thomas Ludwell Lee. Mason again declined a seat in Congress, to which he was elected by the Virginia Assembly on 22 May 1777.

Mason took an active part in the Constitutional Convention of 1787, reaching Philadelphia 17 May. He urged that the President be elected by Congress, and that he be ineligible for a second term; that the States should have equal representation in the Senate; that the Supreme Court should be joined with the Executive in the exercise of the veto power; that Congress be empowered to enact sumptuary laws; "that no law in the nature of a Navigation Act be passed before the year 1808, without the consent of two-thirds of each branch of the Legislature;" and, finally, that Congress should be given the control of slavery. Madison reports Mason's speech in favor of giving Congress the control of slavery as follows: "This infernal traffic originated in the avarice of British merchants. The British government constantly checked the attempts of Virginia to put a stop to it. The present question concerns not the importing States alone, but the whole Union. * * * Slavery discourages arts and manufactures. The poor despise labor when performed by slaves. They prevent the emigration of whites, who really enrich and strengthen a country. They produce the most pernicious effect on manners. Every master of slaves is born a petty tyrant. They bring the judgment of heaven on a country. As nations cannot be rewarded or punished in the next world, they must be in this. By an inevitable chain of causes and effects, Providence punishes national sins by national calamities. He lamented that some of our eastern brethren had, from a lust of gain, embarked in this nefarious traffic. * * * He held it essential in every point of view, that the General Government should have power to prevent the increase of slavery."

It was chiefly the failure to insert his views as to congressional control of slavery and Navigation Acts, which led Mason to reject the Constitution. Shortly before his death he told Thomas Jefferson that "the Constitution as agreed to for a fortnight before the Convention rose was such a one as he would have set his

MASON

hand and heart to. * * * With respect to the importation of slaves, it was left to Congress. This disturbed the two southernmost States who knew that Congress would immediately suppress the importation of slaves. Those two States, therefore, struck up a bargain with the three New England States, that if they would join to admit slaves for some years, the two southernmost States would join in changing the clause which required two-thirds of the Legislature in any vote. It was done.

* * * Under the coalition, the great principles of the Constitution were changed in the last days of the Convention.⁹ Such was Mason's own explanation of his refusal to sign the instrument in Philadelphia and for his stalwart opposition to its ratification in the Virginia Convention, which met at Richmond in 1788. Two years later he declined an appointment to a vacancy in the United States Senate. He died at "Gunston Hall," where he lies buried. Mason's statue forms one of the circle of the Revolutionary fathers surrounding the equestrian monument of Washington at Richmond.

Thomas Jefferson described George Mason as "a man of the first order of wisdom among those who acted on the theatre of the Revolution, of expansive mind, profound judgment, cogent in argument, learned in the lore of our former Constitution, and earnest for the Republican change on Democratic principles. His elocution was neither flowing nor smooth, but his language was strong, his manner most impressive, and strengthened by a dash of biting cynicism when provocation made it seasonable." Consult Rowland 'George Mason.'

S. C. MITCHELL,

Professor of History, Richmond College, Virginia.

Mason, James Murray, American legislator: b. Mason's Island, Va., 3 Nov. 1798; d. near Alexandria, Va., 28 April 1871. He was graduated from the University of Pennsylvania in 1818, studied law and upon being admitted to the bar established a practice at Winchester, Va. He was in public office much of the time and in 1847 was elected to the United States Senate, representing Virginia, where he proved a consistent and strong adherent to the policies favored by his State. He was the author of the fugitive slave law of 1850 and at the outbreak of the Civil War he resigned his seat in the Senate to enter the service of the Confederacy. He was sent to England with Slidell as Confederate commissioner, but was captured on the steamer Trent (see TRENT AFFAIR, THE) and taken to Boston where he was confined in Fort Warren until 1862 when he sailed for Europe and until the end of the war endeavored to secure recognition of the Confederacy. After the war Mason lived for a time in Canada, but returned to Virginia some years before his death.

Mason, Jeremiah, American lawyer and politician: b. Lebanon, Conn., 27 April 1768; d. Boston 14 Oct. 1848. He was graduated at Yale in 1788, admitted to the bar in 1791, and began to practise law at Westmoreland, N. H. In 1794 he removed to Walpole, N. H., and in 1797 settled at Portsmouth, where he lived for 35 years. At the New Hampshire bar, then the most famous in the country, Mason soon reached

pre-eminence, among his fellow members being Daniel Webster and Jeremiah Smith. In 1802 Mason was appointed attorney-general of New Hampshire, and in 1813 became a United States senator. He was a strong Federalist, and took a leading part in the senatorial debates on matters relating to the War of 1812, his speech on the Embargo, delivered in 1814, and that on the conscription bill, 1815, being notable among public utterances of the time. In 1817 he resigned his seat to resume his practice, but afterward served for several terms as a member of the New Hampshire legislature, and rendered great assistance in the codification of the State laws. He removed to Boston in 1832, and practised in the courts until he reached 70, when he retired, with reputation fully maintained, to the more private work of his profession.

Mason, John, American colonist, founder of New Hampshire: b. Lynn Regis, Norfolk, England, 1586; d. London, December 1635. In 1610 he served in the navy against insurgents in the Hebrides; in 1616 went as governor to Newfoundland, of which, in 1620, he published a description, and in 1626 a map. In 1617 he explored the coast of New England; obtained in 1622 a grant of a region called Mariana (northeastern Massachusetts); in the same year, with Sir Ferdinando Gorges, procured a patent for the provinces of Maine; and in 1623 sent a colony to the Piscataqua River. In 1629 he obtained a patent for the New Hampshire colony, also taking one with Gorges for Laconia, a tract including Lake Champlain. Among various prominent positions which Mason held in England was that of judge in Hampshire 1635, and in the same year he was appointed vice-admiral of New England. In 1691 his rights in New Hampshire were sold to Gov. Samuel Allen. Mason was buried in Westminster Abbey. Consult Tuttle, 'Memoir of Captain John Mason, the Founder of New Hampshire,' in an edition of Mason's description of Newfoundland (1887).

Mason, John, American colonial commander: b. in England about 1600; d. Norwich Conn., 1672. Under Sir Thomas Fairfax he served in the Netherlands; in 1630 settled at Dorchester, Mass.; in 1633 was appointed to a military command at Boston; and two years later joined with others in founding Windsor, Conn. In 1637 he was given command of an expedition of English and Indians against the Pequots (q.v.), whom he almost annihilated, completing their destruction in a second movement a little later. He removed first to Saybrook, and afterward to Norwich. For 30 years he was a major of the Connecticut forces, was a magistrate for many years, and deputy governor 1660-70. From 1642 to 1668 he served as judge of the colonial court. His 'Brief History of the Pequot War,' written at the request of the General Court, was reprinted by Increase Mather in his 'Relation of Trouble by the Indians' (1677, republished by Prince 1736). Consult Ellis, 'Life of John Mason of Connecticut,' in Sparks' 'Library of American Biography.'

Mason, John Mitchell, American divine: b. New York 19 March 1770; d. there 26 Dec. 1829. His father was pastor of an Associate Reformed Church, and the son was graduated at Columbia College in 1789, and after studying theology under his father's care for one year went in 1791 to the University of Edinburgh

He was recalled in 1792 by intelligence of his father's death, and became his successor in his pastoral charge in 1793. He planned a theological seminary to be under the authority of his denomination, and visited Great Britain for the purpose of obtaining contributions; his pulpit efforts abroad gaining him repute there as one of the first preachers of the time. The seminary being established in New York City in 1804, he was appointed its first professor of theology. In 1806 he projected the 'Christian's Magazine,' which he conducted for several years, and in which he carried on a controversy with Bishop Hobart. In 1811 he became provost of Columbia College, and by his talents and energy raised that institution to a higher character than it had ever before possessed. In 1821 he exchanged his pastorate for the presidency of Dickinson College, Carlisle, Pa., and the next year entered the Presbyterian ministry. He was one of the great pulpit orators of his day and his discourses on the deaths of Washington (1800) and Hamilton (1804) are masterpieces of their kind. See 'Life,' by Van Vechten (1856).

Mason, John Young, American politician: b. Greenville, Sussex County, Va., 18 April 1799; d. Paris 3 Oct. 1859. He was educated at the University of North Carolina; was admitted to the bar in 1819; became a judge in State and Federal courts; served several terms in the Virginia assembly; and from 1831 to 1837 was a member of Congress. Then till 1844 he was judge of the United States court for the district of Virginia, and in that year became secretary of the navy in the cabinet of President Tyler. Although he served temporarily as attorney-general under Polk, he re-entered the Navy Department. President Pierce, in 1853, appointed him minister to France, and until his death he continued to fill this diplomatic position. With James Buchanan and Pierce Soule (qq.v.) he signed the Ostend Manifesto (q.v.).

Mason, Lowell, American musician; b. Medfield, Norfolk County, Mass., 8 Jan. 1792; d. Orange, N. J., 11 Aug. 1872. His general education was small; in music he was self-instructed and wonderfully adept even when a boy, being choir leader in Medfield when 16, and a teacher in Savannah, where he removed in 1812. In 1821 he published a collection of psalm tunes based on Gardiner's 'Sacred Melodies,' but including some of Mason's own compositions. He is best known for his hymn tunes, notably Cowper ('There is a Fountain'), and Missionary Hymn ('From Greenland's Icy Mountains'). Mason's more important publications were: 'Juvenile Psalmist' (1820); 'Lyra Sacra' (1837); 'The Psalter' (1845); 'Carmina Sacra' (1841; new series 1852); and 'Musical Letters from Abroad' (1853). Mason's musical library is now the property of Yale University.

Mason, Otis Tufton, American ethnologist: b. Eastport, Maine, 10 April 1838. He was graduated from Columbia University in 1861 and from 1861-84 was at the head of its preparatory school. Since 1884 he has been curator of ethnology at the National Museum. He is an influential member of various scientific societies and has published: 'Cradles of the American Aborigines' (1880); 'Woman's Share in Primitive Culture' (1894); 'The Origin of Inventions' (1895); etc.

Mason, Rufus Ogden, American physician: b. Sullivan, N. H., 22 Jan. 1830; d. New York 1903. He was graduated from Dartmouth College in 1854, and from the College of Physicians and Surgeons in New York in 1859. During the Civil War he was an acting assistant surgeon. He was almost as well known as an author as he was a physician and among his books are: 'Sketches and Impressions, Musical, Theatrical and Social, Including a Sketch of the Philharmonic Society of New York' (1887); 'Telepathy and the Subliminal Self' (1897); 'Hypnotism and Suggestion in Therapeutics' (1901).

Mason, Stevens Thomson, American politician: b. Leesburg, Va., 27 Oct. 1811; d. New York City 4 Jan. 1843. He was the son of Gen. John T. Mason of the noted Mason family of that State. He received his education at Transylvania University, Lexington, Ky., to which place his father had removed in 1814. On 12 July 1831, when not 20 years of age, he was appointed secretary and acting governor of the Territory, a position he continued to occupy until 8 Sept. 1835. The death of George B. Potter, the territorial governor during his term, left Mason for several years the actual governor.

Although vigorously opposed by the people of the Territory at the time of his appointment on account of his minority, his stand in the controversy with Ohio, known as the Toledo War, brought him such popularity that he was unanimously chosen governor by the people, upon the adoption of the Constitution by the State on 2 Nov. 1835, a position to which he was re-elected in Nov. 1837. In 1840 he removed to New York City to take up the practice of law.

On 4 June 1905, under authority of the Michigan Legislature, his remains were transported from New York and re-interred in Capitol Park, Detroit, the site of the first capitol of the State.

He is known in the history of Michigan as the "Boy Governor" as he was the youngest person ever appointed to so important an executive position in the history of the Nation.

Mason, William, English poet: b. Hull 12 Feb. 1724; d. York 7 April 1797. He was educated at Cambridge, and his first publication was 'Isis,' a poem, satirizing the Jacobitism and high church principles which prevailed in the University of Oxford. In 1852 he published 'Elfrida,' a tragedy, with choral odes, on the ancient Greek model. Having taken orders in the church he obtained the living of Aston, in Yorkshire, and was appointed one of the royal chaplains. In 1759 appeared 'Caractacus,' a drama. Some years after Mason was made precentor and residentiary canon at York. One of his principal works, the 'English Garden,' a poem, appeared between 1772 and 1782; and was translated into French and German. In 1775 he published the poems of his friend Thomas Gray (q.v.) with memoirs of his life. His principal subsequent publications are: 'Odes'; 'Life of William Whitehead,' with his poems (1788); 'Essay on Church Music' (1795).

Mason, William, American musician: b. Boston 24 Jan. 1829. He is a son of Lowell Mason (q.v.), and studied music in Germany under Moscheles, Hauptmann, Moritz, Dreyschock, and Liszt; made tours as a pianist in Europe and the United States. In the year 1855, with Theodore Thomas and others, he established the Mason and Thomas recitals of chamber music.

MASON — MASON-BEES

which were continued until 1868. His compositions, many in number, are mainly for the piano. He has written: 'Two Pianoforte Methods' (with E. S. Hoadley); 'Pianoforte Technics' (with W. S. B. Matthews); 'Touch and Technics' (1878); 'Memories of a Musical Life' (1901); etc.

Mason, William Ernest, American legislator: b. Franklinville, N. Y., 7 July 1850. He removed with his parents to Bentonport, Ia., in 1858, and after teaching school, 1866-70, was admitted to the bar and began practice in Chicago, Ill., in 1872. He was a member of the Illinois General Assembly in 1879, of the State Senate in 1881-5; and of Congress 1887-91. In 1897 he was elected United States Senator, in which capacity he warmly advocated the cause of Cuban independence.

Mason, Mich., city, county-seat of Ingham County; on the Michigan Central railroad; about 14 miles south by east of Lansing. It was settled in 1839, and in 1865 was incorporated as a village, and in 1875 chartered as a city. It is in a farming region and the industries are chiefly connected with farm products. The principal manufactures are foundry and machine-shop products, flour, fruit evaporators, dairy products, bricks, tiles, wagons, and carriages. The trade is chiefly in the manufactures, grain, fruit, and live-stock. The principal buildings are the court-house, the churches, and schools. The city owns and operates the electrical light plant and the waterworks. Pop. (1900) 1,828.

Mason City, Iowa, city, county-seat of Cerro Gordo County; on the Chicago, M. & St. P., the Chicago & N. W., the Iowa C., and the Chicago G. W. R.R.'s; about 115 miles in direct line north by east of Des Moines. It was settled in 1855 and its present charter was granted in 1870. It is in an agricultural and stock-raising region, fire-clay and valuable sandstone quarries are in the vicinity. Its chief industrial interests are connected with the manufacturing of sash and doors, brick and tile, flour, and lime, and the quarrying of sandstone. It has a large foundry and considerable trade in live-stock and grain. The city is a trade centre and distributing point for a large section of country, and has several wholesale establishments. The government is vested in a mayor, who holds office two years, and a council. The waterworks are owned and operated by the city. Pop. (1890) 4,007; (1900) 6,746.

Mason and Dixon's Line, in United States history, a line popularly known as dividing the slaveholding from the non-slaveholding States. The line was surveyed by two English engineers, Charles Mason and Jeremiah Dixon, between the years 1764 and 1767, for the purpose of settling the disputed boundaries between Maryland on the one side and Pennsylvania and Delaware on the other. Their instructions were to begin at the Atlantic Ocean, and run due west to a point midway between the Atlantic and the Chesapeake Bay; thence north, so that the line should become a tangent to the northwestern boundary of Delaware, which was a circle described from Newcastle court-house as centre, with a radius of 12 miles. The line was then to follow the curve in a westerly direction till it reached a point due north of the point of tangency; thence due north till it intersected a line run due west

from a point 15 miles south of Philadelphia; and thence due west until it intersected a line running due north from the source of the Potomac River. The work was done with such skill and accuracy that a revision in 1849, with instruments of much greater precision, disclosed no error of importance. The line was again surveyed between 1901 and 1903 under the direction of a joint commission representing Pennsylvania and Maryland. The line was originally marked by stones or other designations placed one mile apart. But in the course of time many of the markers disappeared, and disputes as to local boundaries arose. Pennsylvania and Maryland each appropriated \$5,000 for a new survey of the line, and work was begun in April 1901, W. G. Hodgkins, of the United States Coast and Geodetic Survey, being in charge of the corps of engineers. It is the portion of Mason and Dixon's line that extends as far as the western limits of Maryland, which has been re-surveyed. Some of the original boundary stones were found to be still in place. They had been chiseled in England from limestone, and weigh 500 pounds each, being four and one-half feet high and one foot square. On one side is the letter "P" and on the other the letter "M." Every fifth stone bore the coat-of-arms of the two proprietaries. Hodgkin's men endeavored to trace the stones that were missing, and succeeded in recovering a large number. Some were doing duty as doorsteps, some were in bake-ovens, one served as a curbstone in Clear-spring, Md., and two had been used in building a church along the national pike. The old markers in many instances bore curious inscriptions, some carved by soldiers of the Federal and Confederate armies during the campaigns of the Civil War. Every one of these stones that could be secured was placed in position on the boundary line. If broken, the pieces were clamped together. The stones were set in a bed of concrete, to guard against future removal. In a few localities a half-dozen or more of these stones were found in proximity. This leads to the belief that possibly they were not put to actual use as boundary markers. It is known that the full number of stones required by Mason and Dixon was imported, but in conveying them westward through the forests, so many difficulties were encountered, it is supposed, that a portion of the consignment was abandoned along the road; and in the course of years settlers found these stones useful for a variety of purposes other than that for which they were intended. This theory is substantiated by the fact that the western part of Mason and Dixon's line was found to be marked principally by mounds or wooden posts, few stones being discovered. Sufficient of the original stones were recovered to mark the entire line, with the exception of about 75 miles. Where none of the old markers was available, new marble monuments were erected.

Mason-bees, a name given to the small wild bees of the genera *Osmia*, *Ceratostomia*, and *Chalcidoma*, which construct their nests with sand or gravel, agglutinated together by means of a viscid saliva, and fix them on the side of walls, under stones, within the hollows of plant stems whence the pith has been removed, or avail themselves of some other cavity for that purpose. The mason-bees, like the carpenter-

MASONIC FRATERNITY

bees, leaf-cutters, and other allied forms of the family *Megachilidæ*, are solitary in habits, not living in communities, although groups of cells are usually found near together, made by the same mother-bee, and each containing a single egg and food,—a mixture of honey and pollen. Consult Howard, 'The Insect Book' (1901), which contains an extensive bibliography of the subject.

Masonic Fraternity, The. an organization of associated societies to which, by common consent, has been accorded the primacy among fraternal orders. Divided into groups of degrees, overlying one another like the foundation and superstructure of a symmetrical building, these constitute the three great rites of universal recognition, namely, English, American, and Scottish Masonry. The first and second are acknowledged to compose the great masonic institution as it exists in Great Britain and dependencies, and in the United States; while the elaborate Scottish Rite of 33 degrees, comprising a more limited membership therein, is the one most widely disseminated in other portions of the world. Each rite is complex in its inter-dependent system of government, and is essentially cosmopolitan, bearing upon its rolls the names of emperors, kings, princes, presidents, and governors, together with scholars, statesmen, and men of affairs, as well as those of lesser stations in church and state. The full legal title is, "The Ancient and Honorable Fraternity of Free and Accepted Masons and Concordant Orders."

The Appeal to Antiquity.—During the 18th and first half of the 19th century masonic writers laid great stress upon the possible origin of the society in the remote ages of the past. Absolutely without any historical basis of fact or record as were most of these theories, yet men of learning loaned their influence to perpetuate the fables extant concerning the fraternity. Some asserted (a) that the history of the race was the story of masonry, beginning with the migration from the Garden of Eden; others (b) that it sprang from the Patriarchal period; and still others contended (c) that the society was the successor of the ancient mysteries of the Orient; (d) that the Temple of Solomon was its cradle; (e) that the Crusaders and the Knights Templars carried it forward from their times; (f) that the Roman colleges of artificers and builders of the Middle Ages handed down the craft to posterity; (g) that the civil strifes in Great Britain of the 15th and 16th centuries, and subsequent political events, made the institution possible; (h) and a later class of writers placed its origin to the credit of the Rev. James Anderson, D.D., and the Rev. John Theophilus Desaguliers, LL. D., F.R.S., and their compeers of "The Revival of 1717 A.D." Several of these authors changed their views later in life; and, during the past 50 years, the intelligent masons of Great Britain, and the United States, have attempted to build up from the broken fragments of the past,—contained in fugitive lodge records extending back nearly three centuries,—a reasonable history of the "operative" masonry of the British Isles and the continent of Europe, as well as that of the present "speculative craft." In this effort assistance has been rendered by scholars not connected with the fraternity. The critical reader will note, in the enumeration

above, that many plausible theories might be founded upon both history and legend, but the strongest factor in the appeal to antiquity, nevertheless, is the "Legend of the Third Degree." In one form or another the allegory of the fall of man, the sacrificial redemption of the race, the doctrines of the resurrection and immortal life, permeated the peoples of every age and became the motive of many migrations. This fact is likewise of record,—established by the discoveries made in Bible lands during the 19th century,—dating four millenaries B.C. When, therefore, a society arose which claimed to solve some of these mysteries,—nay, even to have descended from those periods,—it is not singular that the cult should have attracted disciples; especially when shielded from public gaze by a veil of secrecy, the universality of the printed page not having yet been established!

In Great Britain and on the Continent.—The consensus of reliable historical opinion affirms that the premier Grand Lodge of England, organized 24 June 1717 A.D., is the mother of all regular masonic lodges of the three craft degrees, and, therefore, peculiar interest centres in the landmarks, legends, and authentic narratives pertaining to the English rite itself, as well as in the American rite, the daughter thereof, so to speak. The apocryphal history of masonry recites that it was introduced into England by Prince Edwin, 926 A.D., and that lodges were "warranted at York," by King Athelstan. This "Legend of the Guild" and much other traditional story, is based upon curious manuscripts called "Old Constitutions," or "Old Charges of British Freemasons." The oldest of these is dated, by English antiquaries, 1390 A.D., and is registered as the "Regius MS., or Halliwell Poem." The next in age,—beginning of the 15th century,—is called the "Matthew Cooke MS."—both in custody of the British Museum. Within the past half-century, notably the last 25 years, many more of these documents have been discovered, transcribed and printed, or published in *facsimile*, so that, including the missing versions, used or referred to therein, the catalogue has nearly 75 entries. These manuscripts have been grouped into families, because of certain characteristics common to two or more,—the whole forming a valuable collection of ancient masonic remains. Each manuscript consists of three parts: (a) the introductory prayer, declaration, or invocation; (b) the alleged history of the order, or the "Legend of the Guild"; (c) the peculiar statutes and duties, the regulations and observances, which masons in general, or the craft as a unit, were bound carefully to uphold and inviolably to maintain. The precise value of the "Old Charges" lies in the fact that they were the formulas used in the ceremonies of initiation by our masonic ancestors of from two to five centuries antecedent. All known copies are of English origin, even those used in Scotland; and, being of a distinctly Christian character, it has been thought they indicate ecclesiastical supervision and composition. A manuscript version of 1583 A.D., in possession of the United Grand Lodge of England, has the following "introductory prayer," and is quoted as an example:

The mighte of the Father of Heaven and ye wysdome of ye glorious Soonne through ye grace & ye goodnes of ye holly ghoste, y^e bee three psons & one God, be w^h vs at or beginning

MASONIC FRATERNITY

and give vs grace so to govvrn vs here in or lyving that wee maye come to his blisse that nevrr shall have ending. AMEN.

Signs, tokens, and words, by which the masonic craft became differentiated from all other trades than builders do not appear in the earlier forms. In time, however, this initiation was exclusively its own; and in the Melrose manuscript 1581 A.D. (known to posterity by the transcript of 1674), reference is made to "Ye priviledge of ye compass, square, levell, and ye plum-rule." The early records show that the lodge system was used from the first as a bond to preserve the art of building as a monopoly. The secret of the organization was then,—in contradistinction to all others,—"the way to build"; and tyled lodges contributed best toward this end. But, in spite of every precaution, another body of operatives arose,—called "Cowans" by the regulars,—which in spite of its lack of prestige, not being in possession of "Old Charges" and the "mason's word," contrived to prosper, eventually breaking down the monopoly and prepared the way for the "speculative" society of modern times. The term "speculative" has reference to a class of members who were not operatives and had no intention of becoming artisans, but were denominated "accepted" masons. The admission of this element proved the wisdom of the fathers, and to it is probably due the permanency of the institution and its continuity to succeeding ages. By its influences the masonic fraternity secured governmental favor, and became "free of the guilds," that is, free of the restrictive laws, which, even now, regulate the "Friendly Societies" of the British empire,—enjoying a liberty which did not inhere in the organization of exclusively operative masons who were not *Free-Masons*, the so-called "Cowans." (Free + Mason, originally written as two words, not mentioned prior to the 14th century.) Just what proportion of the membership was speculative during the earlier or operative period, unfortunately is not known, the first lodge record preserved being of a meeting held "Vltimo, July 1599," but of its mixed character there is no doubt. Old records, recently discovered, and examined in the light of present-day research, have led masonic writers to revise the usually accepted assertion that the cathedrals and other public edifices in Great Britain, erected during the Middle Ages, were planned by church dignitaries. The opinion now obtains that the architects thereof were the Master Masons of that period,—the divisions among the builders of the operative era being apprentices, journeymen (Fellow Crafts), and Master Masons. Each man's work bore a distinguishing mark by which the piece could be identified, and the wage scale regulated. As for example:

By the opening years of the 18th century the decadence of the society had become so great that four of the surviving masonic lodges proceeded to a reorganization in 1717 A.D., as before stated, and this movement is known in history as "The Revival." Four old lodges in London are known to have participated, and probably

others, but the minutes are not extant. Two divines, associated with these brethren, were destined to figure as masonic architects and authors of the new *régime*: James Anderson, D.D., born in Edinburgh, 5 Aug. 1684, a minister of the Scottish Presbyterian Church in Piccadilly, London; and John Theophilus Desaguliers, LL.D., F.R.S., of Christ Church, Oxford, who was born in Rochelle, France, 12 March 1683. Anthony Sayer, a distinguished gentleman, was installed Grand Master. He was of the "speculative" craft, and of the class called "accepted." The Grand Lodge instituted was a governing body, and in no wise a successor of the "General Assemblies" of the operative or legendary period. To Dr. Anderson was entrusted the duty of compiling the "general records and faithful traditions from the beginning of time," and to enable him to do so all the available documents were collected for his use. These were afterward destroyed,—an irreparable loss. In 1723 the "New Constitutions" were published, when it was discovered that Drs. Anderson and Desaguliers had completely changed the theory of the institution,—from Christian to the adoption of a universal creed based on the Fatherhood of God and the Brotherhood of Man,—so as to admit men of all religions, nationalities, and stations in life. These authors included likewise all that is now known of the transactions of the craft from 1717 to 1722 A.D., when the official records commence. The second edition of the "New Constitutions" was published in 1738, with "New Regulations" added, which became the basis of the Freemasonry of the present day. From 1717 the evolution of the society made rapid progress, both as to the increasing area of its operations, and in the multiplicity of its degrees. But the masons of "the revival" and their immediate successors did not long dwell together in unity. Those at York organized a "Grand Lodge of All England," in 1725, and kept it alive for some twenty years. A reorganization took place in 1761, and the body ceased to exist in 1792, never having chartered lodges outside of England. In 1751 a great schism occurred, whereby a part of the premier Grand Lodge withdrew and instituted a rival. In common parlance the latter body became known as "ancients," the former as "moderns," a transposition which is firmly settled in history. A deputation from the Grand Lodge of All England, dated 29 March 1779, created still another body called the "Grand Lodge of England South of the River Trent," and this survived until 2 May 1790. The two rival Grand Lodges,—*"Moderns"* and *"Ancients,"*—happily entered into a concordat on St. John's Day, 27 Dec. 1813 A.D., constituting the present United Grand Lodge of England, declaring that the English Rite of Freemasonry "Consists of three degrees and no more, namely: those of the Entered Apprentice, the Fellow Craft, and the Master Mason, including the Supreme Order of the Holy Royal Arch."

In Ireland no Grand Lodge records are extant of date prior to 24 June 1780 A.D. It is known that there was a lodge at Cork, the first minute of which is dated "December ye 8th, 1726." The city archives refer to a charter for a "Society of Freemasons," and a "Grand Lodge of Munster"; and it is known that other lodges existed prior to 1726. There was also a Grand Lodge of Cork, and one at Dublin. The last

MASONIC FRATERNITY

named was of record in 1728-1729; reorganized 1731 A.D., electing Lord Kingston, who is described as "Grand Master of all the lodges of Free Masons in the Kingdom of Ireland." Irish Masons possessed "Old Charges," and like their English brethren propagated the order far and wide. It was in Lodge No. 44, of Irish register, — warranted in 1735, — that the Hon. Mrs. Richard Aldworth (Elizabeth St. Leger), was initiated, and became the celebrated and only "Female Freemason" of history.

Scotland enjoys the honor of "Mother Kilwinning Lodge, No. 0," universally recognized as the oldest in existence. Its records comprise a minute of 1599, and others ranging from 20 Dec. 1642 to 5 Dec. 1758, A.D., and these communications were held in Kilwinning. Traditional history ascribes to the architects of the Abbey of Kilwinning the pre-eminence which inhered to the Masons of York, in England. A dozen other old lodges are of record, possessing fragmentary minutes and "Old Charges" of rare Masonic value, but the Scottish Craftsmen did not follow the examples set by England and Ireland until St. Andrew's Day, 30 Nov. 1736 A.D., when Baron William St. Clair of Roslin (Earl of Orkney and Caithness), was chosen Grand Master. The following year he was succeeded by George, the third and last Earl of Cromarty. It will be noted that in Scotland, as well as in England and Ireland, the craft was patronized by those of exalted civil rank and station. Scotland's "Masonic gem" is the "Prentice's Pillar," standing in the chancel of Roslin Chapel, Edinburgh.

An unsuccessful attempt has been made to connect, historically, the building crafts of Continental Europe with the Operative Masons of Britain and Scotland. But, in Germany, in pre-Reformation times, the "Independent Stonemasons" arose, coming out from the Monastic orders as the zeal for building magnificent edifices, under ecclesiastical patronage, declined. These "lay brothers" were possessed of "Old Charges," but no authentic documents remain which refer to their most flourishing period of existence. Within the short space, however, of from 10 to 20 years, subsequent to the revival in England, Masonry of the British type had obtained a foothold in all the countries of Europe. It had crossed the seas to America, and in a list of lodges published in 1734 A.D., No. 126, of English register, is shown as located at "Boston, in New England," — known since 5 March 1792 as St. John's Lodge.

Introduction and Early History in America. — It is a well-settled opinion that very early in the settlement of North America masons of the three classes, — operative, speculative, and the irregulars, — met in lodges, without much regard to warrants or charters, and these organizations continued until long after the revival in 1717, especially in the British colonies. Indeed, these assemblies of the craft were quite apart from regularity and the sanction of Grand Lodges. This was the fact in Philadelphia, in 1730-1; and, again, in New Hampshire soon afterward (the last named apparently having "Old Charges"), though nothing has yet been discovered to connect such meetings with the working of the "historic three degrees" of 18th century notation, and post-Grand Lodge era. This raises the mooted question as to

priority in the United States. On 5 June 1730, Daniel Coxe of Burlington, N. J., was appointed Provincial Grand Master of the "provinces of New York, New Jersey, and Pennsylvania, in America," by the Duke of Norfolk, Grand Master of the premier Grand Lodge of England. On 30 April 1733, Lord Viscount Montague, Grand Master, issued a like deputation to Henry Price of Boston, appointing him "Provincial Grand Master of the province of New England, the dominions and territories thereto belonging." Masonic history is obscure as to the part Coxe took in establishing the society, but there is a complete record of the acts of Price. Because of this, Massachusetts was acknowledged to be the "mother jurisdiction" for nearly 150 years; while documents now in the archives of the Grand Lodge of Pennsylvania, and "Libre B." of the Historical Society of that commonwealth, appear to give the primacy to the Keystone State. In support of this contention evidence discovered during the last half of the 19th century goes to show that on 29 Jan. 1731, Coxe visited his Grand Lodge at London, and that a toast was there drunk in his honor, as "Provincial Grand Master of North America"; that from 1732 and for several years, a list of Grand Lodge officers was regularly printed in the *Pennsylvania Gazette*, published in Philadelphia; that, in 1734, Benjamin Franklin being elected Grand Master thereof, wrote to Provincial Grand Master Price in Boston, as to the status of masonry in Pennsylvania; that in June of that year Franklin met Price in Boston and was recognized to the extent of being "further instructed in the Royal Art," by the Provincial Grand Master; and that Grand Master Franklin himself visited the Grand Lodge of England, 17 Nov. 1760 A.D.

The rival Grand Lodges in England, together with those of Ireland and Scotland, chartered lodges everywhere, at home and abroad. Patronized by the Royal family and nobility of Great Britain the craft acquired greater prestige than history records of any other society, and a system of "military lodges" fostered expansion. The roll of warrants issued during the 18th century and subsequent to 1730, would make a large volume. From these beginnings Grand Lodges were formed in America, composed of lodges of English ("ancients" and "moderns"), Irish, Scottish, and "Army" register, increased in number by those holding Provincial Grand Masters' warrants, together with lodges chartered by the earlier American Grand Lodges in the United States and Canada, until regular governing bodies existed in every State, province and territory. Thus the craft has "followed the flag," wherever unfurled.

Knights Templars and Masonry. — The tradition that the "Baldwin Encampment," which, up to the middle of the 19th century, had been conceded to be the witness that Masonic Knights Templars were descendants of the Knights of the Crusades, is not now accepted. Its earliest accredited document bears date 20 Dec. 1780 A.D. The first reference to the Knights Templars as allied to Masonry is contained in the (lodge warrant) minutes of St. Andrew's Royal Arch Chapter, Boston, Mass., dated 28 Aug. 1760 A.D.; the earliest in England is that of Phoenix Lodge, No. 257, Portsmouth, 21 Oct. 1778. Kilwinning Lodge of Scotland, on 8 Oct. 1779, by its master,

MASONIC FRATERNITY

Earl Eglington, warranted the "High Knights Templars of Ireland," at Dublin. The Grand Lodge at York sanctioned the degree of "Knight Templar" in 1780. Similar references,—at dates between the St. Andrew's Chapter's record and the institution of the Grand Encampment, Knights Templars, U. S. A., 11 June 1816 A.D.,—may be found scattered throughout the fugitive minutes of lodges and chapters wherever the British army had been stationed. Whence, then, came the modern "Order of the Temple"? An answer, founded upon historical facts, has never been made. Two theories have been advanced: (a) It is within the range of possibility that a connection existed between the chivalric order of Knights Templars and the fraternity of Operative Masons of mediæval times, because bodies of skilled workmen erected Templar strongholds in the Holy Land, and built their preceptories, priories, and round churches in Europe. The famous Temple Church, London, is an example. What, then, was more natural than that the Knights Templars in the 14th century, proscribed, persecuted, and despoiled of all things, should seek their perpetuation among the affiliated bodies of mechanics of whose universality and antiquity they had abundant evidence? (b) On the other hand, no historical doubt exists that every Freemason living since the Revival of 1717 A.D., can trace his pedigree only to Great Britain. No other association, guild or otherwise, ever grew into a society of Freemasons, nor was any connection with the building trades of the Continent ever claimed by the first Freemasons of Europe. The craft there was a direct importation from England, and in its infancy and for many years, was confined to the upper classes, without the least admixture of the artisan. This was true in Germany, where the French language that of the court and diplomacy, was the one used in keeping minutes, and the early lodges bore French names. In 1740, however, in contradistinction to English, a Scottish Masonry arose,—reputed to hail from Scotland, but having no real connection with the regular society; and from this source have emanated most of the traditions relative to the alleged transmission of the chivalric degrees from the Knights Templars, of whom Jacques de Molai,—executed 11 March 1314 A.D.,—was the last Grand Master. In order to prove the Templar succession, and the legend of Scottish Masonry, it becomes necessary to account for an interregnum between the year 1309, when Walter de Clifton, Preceptor of the Scottish Knights Templars, admitted the dispersion of his brethren, and the date when modern Templary appears of record, during the 18th century, at Boston, manifestly a historical impossibility. Nevertheless, "history fails to record much that actually occurs; much that subsequent ages would gladly know." Notwithstanding, as late as 1854, an authorized edition of "The Templars' Chart," by Jeremy L. Cross, published in New York, gave a succession of Grand Masters from Jacques de Molai,—based on a clumsy forgery of the Swedish Templars,—to the year 1838 A.D. Like many another ingenious theory, framed to connect the "old" with the "new" dispensations, tradition may be true, but it is unsupported by documentary evidence.

Organization and Degrees.—Craft Masonry

was universally organized on the bases that within itself was conserved all the powers of the entire Institution. A Grand Lodge once duly established must *sui generis* be sovereign in its jurisdiction, the bounds of which soon became restricted to a state, province, or other recognized political division. The territorial limits of a Grand Lodge being sacred from invasion, and this principle enforced, Masonry has escaped the successful competition of alleged rival rites purporting to be the craft itself, and also has been secure in its privileges from any and all plans to confederate these bodies into one centralized government,—a guaranty of the perpetuation of the democracy inherent therein. But the symbolism of "Solomon's Temple" as the most glorious edifice of ancient times, probably introduced by Drs. Anderson and Desaguliers (whether from the lost MSS., or otherwise, is not essential), required a more ornate adornment and furniture than a foundation and the bare superstructure upon which Operative Masons had wrought,—hence, naturally, suggested degrees above the original three of the Revival, *et seq.* For more than a century men toiled to perfect the society,—often building better than they knew,—until the three Rites became settled as at present established. The best minds contributed toward this end. As in the Old World, so in the New, the institution had attracted to itself men of high character and standing in the governments thereof, and men of letters contributed their full quota to develop the fraternity, which was expected to endure, as these promoters believe it had already existed, for ages. France, in particular, was prolific in the "fabrication" of degrees and rites, the great volume of which survive only in the musty tomes of 18th century literature. As before inferred, the so-called Scottish Masonry became the forerunner of a rite that, perfected by scholarly masons, ultimately became the Ancient and Accepted Scottish Rite. This title is now applied to a system which was first definitely organized at Charleston, S. C., 31 May 1801 A.D. The rite in several of its degrees can boast of a very respectable antiquity, having descended from a "Council of Emperors of the East and the West," at Paris in 1758. It is also based on the three craft degrees, and its postulants must be Master Masons in good standing, in whatever other regular rite they may hold membership. The original Supreme Council in America passed through an experience similar to that of the premier Grand Lodge of England before its authority as "Mother of the Rite" was fully established in the masonic world; but peace came finally, and two recognized bodies exist in the United States: the primate, as the "Southern Jurisdiction," and the present "Northern Jurisdiction," established by a concordat, signed at Boston, Mass., by several rival Supreme Councils, 17 May 1867. This rite was introduced into England in 1845; and other Supreme Councils of this obedience exist in Scotland, Ireland, Canada, Egypt, and colonies of Great Britain; in France and dependencies, and in other countries of Europe, excepting Russia; in South and Central America; and in the West Indies. As before stated, the masonic government is complex, no two rites—nor even Grand jurisdictions of the same rite,—being alike, owing to variances in the sequence of their degrees. The English

MASONRY AND BUILDING

and American are substantially in unison as to chronological order: Craft, Capitular, Cryptic, and Chivalric degrees. In the American Rite its degrees follow this notation exactly, being the Lodge, Royal Arch Chapter, Council, and Templar systems, respectively. England, Scotland, and Ireland, working the English Rite, are not altogether in accord,—additional degrees and orders being incorporated,—but, eventually, all arrive at practical universality, nevertheless. The A. A. S. R. is divided into grades or degrees: symbolic (the three Craft degrees, which are not conferred, however, in jurisdictions of the English and American Rites), Ineffable, Historical, Philosophical, Historical and Philosophical, Chivalric, Official and Executive,—conferred in lodges, councils, chapters, consistories, and supreme councils.

The Ancient Arabic Order of Nobles of the Mystic Shrine (q.v.) has fostered and developed the social side of Freemasonry, in its "higher degrees," principally in America.

Statistics.—In the United States and Canada the membership of Symbolic Masonry is published annually, the total for the year 1903 being 962,438, in 12,704 constituent lodges, under 57 grand lodges. The net gain during 1902 was 39,500. Abroad, the privilege of membership in two or more lodges militates against an accurate enumeration, but the returns show lodges as follows: Grand Lodge of England, 2,350; Grand Lodge of Ireland, 1,009; Grand Lodge of Scotland, 614.

HENRY LEONARD STILLSON, 32°,
Masonic Historian.

Masonry and Building. MASONRY, from the French, *maçonnerie*, meaning stone or brick work, derived from the Latin, *maceria*, a wall, is the operation and resulting construction, of laying up natural or artificial stones, generally held together or made a single mass by mortar, plaster or earth. It is the most important part of large building work, and a mason frequently becomes the general contractor for a whole building operation. The different trades required in mason building begin with building movers or the workmen who raze or demolish old buildings; then come the excavating, drainage grading, paving, piling, foundations, rubble, cut stone, including cut moldings, modeling and stone-carving, brick masonry, concrete work, fire-proofing, terra-cotta work. After this heavier construction follows lighter mason work: plastering on metal or wood lathing, and stucco. Other trades employed in completing a building are steel and iron construction, sheet metal work, carpentry, painting, and glazing. The ideal of good masonry is a structure of natural or artificial stone that

shall stand as the backbone of the building, firm and enduring; its great first cost shall mean no further care or expense.

History.—The Egyptian stonework was generally of enormous blocks jointed with astonishing accuracy, so as not to mar the effect of the bas-reliefs which covered several courses. Assyrian walls were laid up with bricks forming the exterior surface and the interior was filled with earth. The early Greek or Pelasgic walls were followed by more developed forms such as those called *ισόδομος* and *ψευδοισόδομος* which became the Roman *Isodomum* and *Pseudisodomum* walls. *Opus reticulatum* and *opus incertum* were later Roman forms where small blocks of tufa or triangular brick were used for the exterior surface and the interior was filled with concrete. The characteristic of Greek masonry was to use local stone, accurately cut and jointed if the stone would bear it; otherwise covered with stucco. From the lintel or beam architecture of the Greeks to the arch construction of the Romans was an advance in the possibility of size of construction, but a change from a system of making the constructive forms visible and decorative to a custom of covering rough walls with a decorative shell not expressing the supporting masonry work behind. This method of building, however, gave the Romans an opportunity to make their enormous structures at a much less comparative cost, because unskilled labor could be employed to much better advantage, needing only a small number of foremen. Romanesque masonry was very crude and the thrusts of the arches were taken care of by a mass of abutments which were practically monolithic. In Byzantine work, however, the arches and domes were made from small blocks of stone and the thrusts were studied with much greater care. In Gothic work the arch became "alive," carrying the weights and thrusts of the upper parts of the building on slender shafts, and through flying buttresses with the utmost skill to the outer walls and buttresses. Modern work has come to partake of the character of the ancient Roman construction, that is, a veneer on interior supporting masonry of a different character. In our time, however, instead of the huge concrete monolithic buildings, an iron skeleton is used, and a thin shell often not more than four inches in thickness covers a framework of steel beams that in a high building is little more than an iron bridge on end. The old Roman flat arch construction of thin bricks or tiles held together by strong cement forming domes not over six inches thick and easily spanning 15 feet or 20 feet is also used. Brick and terra-cotta are increasing in quality and variety and are admirable for covering steel construction.

Men and Material.—The workmen employed on masonry are as follows: stonecutters, who generally work in stone yards away from the building, except for such trimming as may be necessary in setting the stone; stonemasons who work on the building, setting the stone, and bricklayers. Besides these, laborers are needed for delivering the stone, mortar, etc., and for mixing mortar and concrete. The materials used are such substances as stone, brick, terra-cotta, broken stone, cinders; and adhesive materials: limes and cements, which are used with sand to make a mortar for binding the materials together. In very crude con-

struction, mud and clay are used for a binding material. Foundation walls may be of stone laid dry; of concrete; of stone laid in Portland cement mortar or half-cement mortar, the latter consisting of sand, cement, lime, with cement and lime in equal proportions. In case of the soil under the building not being sufficiently firm, it is necessary either to drive wooden piles or to spread the foundation so far that the pressure per square foot on the soil will not be sufficient to cause the building to settle. In Chicago the footings are very large, of steel beams and concrete, making what is practically a raft so that the building really floats on a soft soil. Where the foundations are under water, as under a bridge pier, it is necessary to adopt special methods, generally sinking caissons so that workmen may go down and work under water.

Ashlar Facing.—The stone work of the outer face of a wall when it is cut and differs in character from the back of the wall is called *ashlar*. The coursing of ashlar is done in different ways. The simplest form is when it is laid out in continued courses. In this case it is called "regular coursed ashlar." Ashlar is also laid without long horizontal joints. In this case it is called "broken ashlar." This is generally used when stone cannot be easily obtained of equal heights. It takes longer to lay this up, which makes it cost more than the regular courses, but makes a very attractive looking wall, having more freedom and texture. It is customary to cut the stone at the stone yard certain heights; for example, 2, 4, 6, and 8 inches so that they can be laid up without cutting any joint except the end joint, at the building. From 3 to 6 different heights are generally used, the larger number giving more variety than when the smaller number of sizes is used. Stone work is sometimes laid Flemish bond, similar to Flemish bond in brick work.

Coursed random ashlar has horizontal joints $\frac{3}{2}$ to 2 feet apart, continuous. Between these joints the stone is laid up irregularly. The other stone on the walls of a building are called trimmings, which include the molded work, the window sills, jambs, and the quoins, which are the cornerstones of the building. The quoins and jamb stones, if of the same material, may be included with the rest of the ashlar. The part of the wall back of the ashlar (called the backing) is of cheaper stone or brick. It is never under 8 inches thick when of brick, and if of stone the backing is thicker. This should be built and bonded in at the same time as the ashlar in order to make a solid wall. If the stones are not high, the thickness of the ashlar should vary so that the backing can bond in and it is generally specified that the ashlar should include one through bond stone in every ten square feet of wall. If the facing is thin (2 inches to 4 inches), the pieces are clamped back into the backing by iron clamps. Random rubble is where untrimmed stones are used, and selected to fit as well as possible.

In public work and important buildings, every stone should be shown on the drawings, except when random ashlar is employed. In this case the arrangement of the stone is made by the foreman on the building, to follow a sample piece of ashlar set up and approved by the architect, instead of being shown on the drawings. Ashlar is usually from 4 inches to 8 inches

thick. In figuring the quantity an average of 6 inches in thickness is generally taken. The heights vary from 10 inches to 14 inches. For exterior work the ashlar should not be under 4 inches thick. The ashlar may be laid with V joints, or with rustication. In the latter case the face is generally rock-face or pointed and a draft-line 1 inch wide is carried around the edge of the stone.

Bond stones are stones that go into the wall to hold the wall together. If there are many small stones these should be frequent. In laying out ashlar the bond should be arranged to give effective stone jointing. Bond stones the full size of a pier are frequently used for caps and also placed at intervals through the pier.

Brickwork.—In brick work, the bricks are laid so as to distribute the load and tie the different portions of the wall together. Stretchers are brick which are laid showing their long side. Headers show the end of the bricks. Common bond is to lay the brick with stretchers for five courses and then lay headers for the sixth course. Face brick bond is as a rule laid of stretchers and bonded either by clipping the corners of the bricks, which ties the face of the wall to the backing or with metal wall ties, which are made of wire, crimped metal, or of tin fastened to steel wire. Flemish bond is the bond which is most frequently used to give an interesting wall surface, more pleasing than what is obtained with common bond. It is laid up with alternate headers and stretchers. The small piece inserted at the corners is called a closer. English bond consists of courses of headers and stretchers alternating. A variety of this, called English cross bond, has the alternate courses of stretchers arranged with the joints below the middle of the bricks above, making a figure resembling a cross. Sometimes every fifth course of brick is laid Flemish bond with the others straight bond. Every fifth course may be set in an inch, forming rusticated work. When walls have hollow or "vaulted" spaces not over 2 inches wide in the centre the bond is made by bricks laid across the space and cut in diagonally, or by the use of metal ties every four to eight courses. In arches, the face of the arch is made with the same bond as that shown on the wall. Common arches are made with successive rings or rowlocks, of headers.

Bricks.—Bricks at the present time are being used more and more in construction, as they are not affected by the weather, fire, or city atmosphere, which affects the softer building stones seriously. They are cheaper than stone and can be used with cut stone or terra-cotta trimmings. Hard burned bricks are used for piers, though not so good for this purpose as stone work, and in very dry soils are sometimes used for foundation walls. If there is any dampness of the soil, the outside of brick foundation walls is sometimes painted with water-proof paint. Bricks are made from sand and clay, the clay in different localities making bricks of different characteristics. A sandy clay is most desirable. For the better kinds of brick, clay is often chosen from different places and combined with the greatest care. The customary way of making bricks is to throw the clay into a large open space where it can be dumped from carts which take it from the clay bank, where it is excavated. It is ground and mixed by

horse-power, water being poured in and making it all soft so that it can be pressed into molds, and sand is added as needed. If the molds in which the bricks are made are dipped in water before the clay is pressed into them, the bricks are called "water-struck" bricks. If the molds are dipped in fine sand so that the clay will not stick, the bricks are said to be "sand-struck." This method gives a better formed brick than water-struck. The molds are taken to a smooth yard and laid in the sun where they are allowed to dry several hours, being usually sprinkled with sand and turned. Then they are piled in large piles and arranged so that fires can be built to burn until hard. The bricks next the fire, which have generally burned ends, are called "bench bricks," while those farthest from the fire next to the outside of the kiln are called "light hard" bricks. Machines are gradually replacing this primitive form of making bricks, the whole process being carried through with little hand labor from the time of the steam shovel taking the clay from the bank until the finished brick is taken from the kiln. There are several kinds of machines, one forcing a continuous stream of clay through a die the size of a brick, while a knife on a revolving wheel cuts off bricks the proper length from this continuous line of clay. Another method forces the soft mud into a series of molds, which are taken out on the drying yard while other moulds are placed in the machines. Sometimes these bricks are taken and put in another machine which represses and re-forms the brick into a truer form; this does not, however, increase the strength of the brick. Another machine takes the clay dry, and after grinding, subjects it to great pressure, making a so-called pressed brick. These bricks are more expensive than the others and have a smoother surface and nicer finish. The latest form of kiln is a series of sections arranged so that all stages of the operation are going on at the same time, the heat, after burning one section, being passed through to dry the brick just put in another section, while still other parts are being emptied or re-filled. Terra-cotta and pottery are burned in kilns which are arranged to let in heat half way up the kiln so that it will be drawn down on to the pile of terra-cotta and through the floor of the kiln into the chimney. This is said to give a more even heat. If there is iron in the clay the color of the brick will be red; the ordinary white bricks are generally due to lime. The proportion of iron makes the red of various shades, according to the amount. Lime and iron make a cream-colored brick. Brown bricks are due to the presence of magnesia; and magnesia and iron make a yellow brick. Different clays give varying color effects, and the mixture of clays with mortar colors, or painting the exposed surfaces, gives desired effects. Bricks should not absorb more than from 1/20 to 1/10 of their weight of water. This is a test that can be easily applied. Soft bricks may absorb as much as a quarter of their weight. Bricks should ring when struck, as cracked or soft bricks will give a dull sound. They should not have any cracks or large lumps or foreign substance, such as lime or coarse gravel. They should run all the same dimensions with true surfaces, though for rustic work, rough bricks are often desired. The approximate size of a brick is 2" x 4" x 8". In the Eastern States

7 3/4" x 3 3/4" x 2 1/4"; but in the Western States the dimensions are slightly larger. In every case where brick work has to be figured for cutting stone trimmings, the brick should be laid up and measured. Pressed brick are generally 8 3/8" x 4 1/8" x 2 3/8" in size. Roman brick is 12 inches long and 1 1/2 inches thick. Norman brick is 12 inches long and 2 inches thick. Bricks weigh four or five pounds apiece.

Masonry (Fraternity). See MASONIC FRATERNITY.

Masoola, ma-soo'la, a boat common on the east coast of India, adapted to be beached on the surf-beaten shore. The planks are sewed together with coir, over wads of the same material, which press upon the seams. The boats are 30 to 35 feet long, 10 to 11 feet beam, 7 to 8 feet deep, and are rowed by 12 men, oars double banked, and a steersman with an oar at the stern.

Masora, mäs'ö-ra, or **Massorah**, a Hebrew word signifying "tradition," the name of a collection of notes referring to the Hebrew text of the Old Testament, and written in Chaldee chiefly on the margin of Hebrew MSS. These notes are various in their character, critical, grammatical, and explanatory. At what time the accumulation of these notes was commenced cannot be ascertained. According to some Jewish writers the notes are in some cases as old as the time of Moses; according to others they were begun in the time of Ezra. A useful edition of the Masora is the translation of Dr. Ginsburg (3 vols. 1880-7). See JUDAISM — *The Massorah*.

Maspero, Gaston Camille Charles, gäs-tôn kä-mël shäri mäs-pë-rö, French Egyptologist; b. Paris 23 June 1846. He studied in the Lycée Louis-le-Grand, 1853-65, and before entering the Ecole Normale in 1865 had already made considerable progress in the study of Egyptology. He remained in the latter college two years and attracted the attention of Mariette, the distinguished Egyptologist. In 1867 he published in the Revue Archéologique an Egyptian text and translation under the title 'Stèle du Songe,' and in the same year appeared separately his 'Mémoire sur la grande Inscription d'Abydos et la Jeunesse de Sésostri.' On leaving the Ecole Normale he went to South America to carry out researches in the Quichua language. Further memoirs on ancient Egypt extended his reputation and secured his appointment in 1869 as professor of the Egyptian language and archaeology at the Ecole des Hautes Etudes. In 1871 he issued an important essay, 'Des Formes de la Conjugaison en Egyptien ancien, en Démotique et en Copte'; and in 1873 'De Carchemis Oppidi Situ et Historia antiquissima' and 'Du Genre épistolaire chez les anciens Egyptiens.' In 1874 he succeeded Rougé as professor of Egyptian philology and archaeology at the Collège de

France. Sent to Egypt in 1880 as head of a government archaeological mission, he succeeded Mariette in the following year in the directorship of excavations and antiquities. He founded and directed an archaeological institute at Cairo, had charge of the museum at Bulak, now in Gizeh, carried out many excavations, with important results, and in 1886 returned to France to resume his duties at the Collège. In 1899 he again went to Egypt as director of excavations and antiquities. Maspero's great work is his 'Histoire ancienne des Peuples de l'Orient' (1875), which has been republished in an enlarged and revised form (1894-9). The three volumes of the later edition have been translated into English under the titles 'The Dawn of Civilization' (1894), 'The Struggle of the Nations' (1896), and 'The Passing of the Empires' (1900). His other works comprise the following: 'Contes populaires de l'Égypte ancienne' (1883), translated by him; 'Études Égyptiennes' (1886-91); 'Archéologie Égyptienne' (1887; Eng. trans. 'Egyptian Archaeology' 1888); 'Lectures historiques' (1890; Eng. trans., 'Life in Ancient Egypt and Assyria,' 1892); 'Études de Mythologie et d'Archéologie Égyptiennes' (1893), invaluable to the student of the religion of ancient Egypt; besides contributions to the 'Mémoires' of the French Archaeological Mission at Cairo, etc. In 1879 Maspero was made a knight of the Legion of Honor, and in 1895 commander. Since 1883 he has been a member of the Académie des Inscriptions, and in 1887 became an honorary fellow of Queen's College, Oxford, and an honorary D.C.L. of that university. See EGYPTOLOGY.

Masque. See MASK.

Masquerade, *mäs-kê-räd'*, a popular amusement, in which persons of both sexes mask or disguise themselves, and engage in dancing, or festivities. Masquerades are said to have been the invention of Granacci, an Italian, who lived in the beginning of the 16th century. See CARNIVALS.

Mass, in physics, the quantity of matter in a body. The mass of a body is the same wherever the body may be in the universe. Two bodies have equal masses if the gravitating forces with which another body acts upon them are exactly equal at equal distances. (See GRAVITATION.) Hence two bodies have equal masses if their weights are the same at the same place on the earth; so that if the metallic "weight" used by a grocer is carried from place to place, the quantities of sugar and tea balanced by it in a good pair of scales will always be the same, for the mass of tea or sugar is in every case equal to the mass of the metallic "weight." It is to be clearly understood that as the force of gravity is different at different places on the earth, the weight of any body is different at different places. To distinguish between the mass (or quantity of matter) and the weight (or force which tends to move it downward) of a body is very important in beginning the study of physics.

Mass, in the Roman Catholic Church, the celebration of the eucharistic sacrifice with all the prayers and ceremonies accompanying it. Roman Catholics believe that the mass is the unbloody oblation of the body and blood of Christ, under the appearances of bread and wine, in praise, adoration and thanksgiving to God.

The word *mass* is of Latin origin, though attempts have been made to derive it from Hebrew sources, but ineffectually. It comes from the Latin word *missa* "sent," which is the participle of the verb *mittere*, "to send." *Missa*, according to some, may mean prayers sent to God or the sending or offering up of the sacrifice to God. But the commonly accepted, and no doubt correct, origin of the term is from the expression in the liturgy, used to dismiss first the catechumens after the gospel and the sermon, and then, the faithful at the end of the service: *Ite, missa est*; "Go, the meeting is dismissed." In the early Church when the Discipline of the Secret (q.v.) was part of the Church's economy in self-preservation against a virulently hostile paganism, the catechumens, that is, converts in course of instruction, were not permitted to remain through the more sacred parts of the eucharistic service; these were reserved for the faithful alone, who were fully acquainted with the profounder mysteries. The first part of the service was therefore called *missa catechumenorum*, the mass of the catechumens, and the second, *missa fidelium*, the mass of the faithful; and so, in the sequel, the entire service received the name of *missa* or mass. After the stress of persecution had relaxed and the need of the enforcement of the Discipline of the Secret had passed, the dismissal of the catechumens ceased, and all were suffered to remain throughout the entire ceremony.

At first the bishops and priests celebrated together, but as the number of the faithful increased, and communities of Christians rose, not merely in the cities, but also in the villages, priests celebrated the divine service independently; at first they officiated only before the whole community, and on days appointed for the purpose; at a later period also on ordinary days, and even alone, for their own benefit, with the assistance of one altar servant only. Thus originated with the high or solemn mass also the private mass, performed by the priest, assisted by one altar servant only. The celebration of the eucharistic sacrifice, or the mass, separate from the preaching, became more and more common, the people participating only in the public services. In the private mass the responses, etc., were made by a servant of the altar, and the priest alone took the sacred elements. It is now the law of the Church that in all private masses the priest must have one server to represent the body of the faithful. What is called Solitary Mass, that is, where no one is present to make the responses, is now forbidden. The priest, who celebrates, always communicates for the integrity of the sacrifice; but it is not necessary for any of the congregation to do so.

The mass consists of four chief parts:—1, the introduction is called the *evangelium*, or gospel, and formerly constituting, with the sermon, the mass of the catechumens; 2, the *offertorium*, or the oblation of bread and wine before the consecration; 3, the consecration or transubstantiation, when the elements of bread and wine are changed into the body and blood of Christ; 4, the communion. These four chief parts, of which the latter three are considered the most essential, are composed of several smaller parts, each having its proper denomination; they consist of prayers, hymns, shorter and longer passages of the Holy Scriptures, and a number of ceremonies, which, as the essential

point of the mass is the sacrifice of the Lord, consist partly of symbolical ceremonies commemorative of important circumstances in the Saviour's life, or signs of devotion and homage paid to the presence of the Lord in the host. The order of these ceremonies, and of the whole celebration of the mass, is given in the missal, or mass-book. The masses are modified according to many circumstances. Thus certain parts are changed according to the saint in honor of whom the mass is celebrated, or the seasons of the year connected with different events in the Saviour's life, or the purpose for which the mass is said, as the *missa pro defunctis* (mass for the dead). The *mass of the day* is such as is proper to the season, or to the feast which is celebrated. *Votive mass* is one which does not correspond with the office of the day, but is said by the choice of the priest. *High mass* is that which is sung by the priest assisted by a deacon and subdeacon or other clergy and the responses sung by the chorists, generally accompanied by musical instruments. *Low mass* is the ordinary mass celebrated by the priest without music. Consult: O'Brien, 'History of the Mass and Its Ceremonies in the Eastern and Western Churches'; Gihe, 'The Holy Sacrifice of the Mass, Dogmatically, Liturgically, and Ascetically explained' (6th ed., 1904); Rock, 'Hierurgia, or the Holy Sacrifice of the Mass'; Cardinal Bona, 'The Mass.'

Massa, mäs'sä, or Massa di Carrara, Italy, the capital of the province of Massa e Carrara, situated on a hill three miles from the Gulf of Genoa, and 20 miles by rail southeast of Spezia. It is an episcopal see, has a cathedral, public library, and academy of arts and sciences, and an ancient ducal palace now used as the prefectural building. The chief industry is the quarrying of the superior white marble in the vicinity; tobacco, silk, cotton, paper, and oil are manufactured. Pop. (1901) 26,413.

Massachuset, mäs-a-choo'sët, a tribe of North American Indians of the Algonquian stock, formerly living in the neighborhood of Massachusetts Bay, between Salem and Plymouth. A pestilence in 1617 greatly reduced their number and they gradually disappeared. See ALGONQUIN; INDIANS.

Massachusetts, one of the 13 original States of the Union, and the most populous of the New England States; between lat. 42° 14' and 42° 53' N., and between lon. 69° 55' and 73° 32' W. from Greenwich. Its greatest length is 184 miles and greatest breadth 113¾ miles, the average breadth being 47¾ miles. Capital, Boston. Population (1900) 2,805,346. Its familiar name "The Old Bay State" is due to its location upon Massachusetts Bay, an inlet of the Atlantic Ocean which forms the eastern boundary of the State. It is bounded on the north by the States of New Hampshire and Vermont; on the west by the State of New York; on the south by the States of Rhode Island and Connecticut, together with the Atlantic which, skirting the southeastern coast, forms between the outlying islands of Martha's Vineyard and Nantucket, belonging to the State, a broad waterway known as Nantucket Sound and an inlet called Buzzard's Bay, beyond the eastern extremity of Long Island Sound. The name "Massachusetts" is compounded from Indian words meaning "Great

Hills Place," alluding probably to heights of land near the coast in the vicinity of Boston. The present State seal, adopted in 1780 in place of other devices previously in use, shows an Indian holding in his right hand a bow and in his left an arrow pointing downward, all of gold, displayed upon a blue shield, and in the upper corner, above the right arm of the Indian a silver star having five points. The motto, adopted for Massachusetts by the Provincial Congress in 1775 is, in Latin, "*Ense petit placidam sub libertate quietem*," or in English, "With the sword she seeks quiet peace under liberty."

Topography.—The area of the State comprises 8,315 square miles, 8,040 square miles being land surface, and 275 water. A portion of the Appalachian Mountain system forms two distinct ranges crossing the western part of the State from north to south. Of these, the Taconic range on the extreme western border has as its highest elevation Mount Greylock (3,535 feet) in the northwestern corner of the State, which is also the highest elevation found within Massachusetts. Thence the range falls to an elevation of 2,624 feet near the southwestern corner. The other or Hoosac range farther east has, as its highest peak, Spruce Hill (2,588 feet), its general height ranging, however, from 1,200 to 1,600 feet. Mount Tom (1,214 feet) and Mount Holyoke (955 feet) are conspicuous elevations rising above the valley of the Connecticut River. Mount Wachusett (2,108 feet) and Mount Watatic (1,847 feet) in the north central part of the State are also noteworthy. An elevated plateau, 1,100 feet high at its greatest elevation, forms the central portion of the State and slopes gradually toward the east, the highest point near the coast being the Great Blue Hill of Milton (620 feet). The sandy peninsula or arm of land known as Cape Cod is a distinguishing feature of the topography of the State, enclosing between the bend and the main coast the considerable body of water known as Cape Cod Bay. The main coast line, some 300 miles in extent, affords excellent harbors, especially at Boston, New Bedford, Gloucester, and Salem.

Rivers and Lakes.—The principal rivers are the Connecticut, crossing the State from north to south, approximately 40 miles east from the western boundary; the Housatonic, flowing south, and the Hoosac, north, between the Taconic and Hoosac ranges; and the Merrimac, in the northeastern part of the State, having its source in New Hampshire and flowing into the Atlantic on the eastern coast. These rivers, except the Merrimac for some 15 miles from its mouth, are not navigable for shipping; but together with the Deerfield, Westfield, Chicopee, and Miller's River, branches of the Connecticut, the Nashua, and Concord, branches of the Merrimac, the Blackstone flowing from the centre of the State southerly across the Rhode Island boundary, and numerous other small streams, afford waterpower of the highest efficiency which has been fully utilized in the industrial development of the State and contributed largely to the extension and growth of manufacturing, the chief source of the wealth of its people. The Mystic and Charles rivers, flowing into Boston Harbor, and the Taunton, entering the bay at Fall River, are tidal streams each navigable for a short distance inland. There are numerous small lakes or

ponds throughout the State, adding much to the beauty of the landscape, and, in many cases, utilized as sources of water supply for the inhabitants.

Geology.—The rocks are principally metamorphic of the Archaean and Palaeozoic systems. In the river valleys and elsewhere there are masses of glacial drift, including sand and boulders, some of the latter being of large size. No mineral deposits of great value exist, except stone for building purposes, limestones, and sandstone of the highest quality being quarried in the Connecticut Valley and west of the Connecticut, and granite of several varieties and superior character at Cape Ann, Quincy, and to a lesser extent in other eastern sections. The elevations of the lower Connecticut Valley are composed of bellerophones, feldspathic, and calcareous gneiss. There are extensive Mesozoic sandstone beds and shales in the Connecticut Valley, with small areas of syenite on each side, and an area of gneiss extending easterly from the Connecticut to the central part of the State. Syenite and porphyry are found in the east; feldspathic gneiss and granite in Plymouth and Bristol counties; gneiss and hornblende schist in Middlesex County; syenite in Essex and Norfolk counties; carboniferous deposits in Bristol and Plymouth counties, and Cambrian, Silurian and Devonian limestones, quartzites, schists, and slates west of the Connecticut.

Climate and Scenery.—The temperature is variable, and, especially in the eastern parts of the State, subject to frequent and wide fluctuations. In the early spring easterly winds prevail upon the coast, which are peculiarly trying to persons of delicate constitution. The winters are moderately severe, although near the sea there is much mild weather, during the winter months, and the fall of snow is not excessive. The summers are frequently marked by periods of excessive heat, and sometimes by prolonged drought. The mean average rainfall for the State is about 48 inches. The normal temperature rises above the freezing point at Boston about March 7, and the normal temperature of 60° for the day reaches Boston about May 24. It falls to 60° about September 25. Observations extending over 25 years show that upon the average experience the warmest week at Boston follows July 13. On the other hand, the coldest week follows February 24.

The scenery in the western counties is exceedingly picturesque, notably in the valleys of the Connecticut, Hoosac, Deerfield, and Housatonic rivers. Here are found the noted Berkshire Hills. The northeastern coast line extending southerly from Cape Ann is bold and rocky, while the southern and southeastern shores of Cape Cod and Buzzard's Bay are low and sandy. The islands of Martha's Vineyard and Nantucket, and the group known as the Elizabeth Islands, partake of the characteristics of the neighboring mainland.

History.—The native inhabitants of Massachusetts were Algonquins of various tribes, each having its distinguishing name. The Indian nomenclature of hills, rivers, lakes, and local districts is still preserved in many cases. The first fully authenticated visit of a European explorer is that of Bartholomew Gosnold in 1602, although there are traditional accounts of the visits of others, particularly of Northmen under Leif Erikson, some 600 years earlier, with sub-

sequent settlements maintained during three centuries, of which, however, no undisputed traces exist, although a commemorative tower erected on the Charles near Boston is claimed to mark the site of a Norwegian settlement named Norembea. Gosnold skirted the coast from Salem southward, named Cape Cod, and discovered the neighboring islands. A settlement made upon one of these was soon abandoned. Subsequent attempts at settlement by Prynne, 1603, and Waymouth, 1605, also failed. The Pilgrim Fathers, so-called, a company of English separatists who, seeking religious freedom, had, under the guidance of their pastor, John Robinson, left England for Leyden in Holland in 1607-8, sailed from Delfthaven in 1620, and soon afterward, 102 in number, from Plymouth, England, in the Mayflower (q.v.), with the intention of forming a settlement south of the Hudson River. Under stress of weather, however, they were forced to land in Provincetown Harbor 11 Nov. 1620, and finally upon the mainland at Plymouth 11 December (old style), where a settlement was established under a constitution or compact signed by all before leaving the ship, John Carver being chosen governor for one year. Despite much hardship this settlement was never abandoned and formed the basis of the Plymouth Colony.

A settlement made at Cape Ann in 1623 by English fishermen was in 1626 abandoned in favor of a location at Salem. A company of English Puritans under John Endicott, having obtained a grant of land on Massachusetts Bay, joined them in 1628. Under a charter granted the following year the Colony of Massachusetts Bay was firmly established. In 1630, the colony received large accessions under John Winthrop, and the seat of administration was soon transferred, first to Charlestown and finally to Boston. These two colonies, Plymouth and Massachusetts Bay, advanced side by side, the last named growing in importance by constant accessions, although less tolerant than the former in religious matters. The original government was indeed theocratic, based upon the Congregational form of church government, which was established by law in 1651. A confederacy including the two colonies and that of Connecticut was formed in 1643, followed by one upon a somewhat broader basis in 1663.

In the Massachusetts Bay Colony religious intolerance was frequently exhibited during the early years. Roger Williams and others whose opinions were thought to be dangerous to the community were banished.

Troubles with the Indians, the original inhabitants of the country, involved both colonies, the more important being the Pequot War, 1636-7; and the war with King Philip, 1675-6. Gradually relations with the mother country became strained. After the restoration of Charles II, a royal commission was appointed to administer the government, but was prevented from exercising its powers by the colonial authorities. The English High Court of Chancery in 1684 declared the charter of Massachusetts forfeited; and a succession of governors appointed by the Crown administered the colonial government, generally with much friction engendered by an adverse public opinion. Plymouth and Massachusetts Bay Colonies were consolidated under a new charter in 1692. The territory of Maine, New Hampshire, and Ver-

MASSACHUSETTS

mont formed part of the original province, separation being progressively accomplished and finally completed by the creation of the independent State of Maine in 1820.

In the colonial wars between France and England, and in difficulties with the Indians prompted by French influence adverse to the English colonies, Massachusetts was largely involved. Especially in the French and English wars, 1744-8 and 1758, the colony took an important part, contributing in great measure to the success of the expedition against Louisburg and other Canadian campaigns. In these military operations, the colonists learned to estimate their strength justly, and acquired experience which was of great value in the final struggle which resulted in independence.

Measures of taxation devised by the home government, and restrictions upon the growing commerce of the colony led to a constantly increasing spirit of resistance, and, finally to riots in Boston, 1765-8, against the enforcement of the Stamp Act (q.v.). In 1770 three citizens of Boston were shot by British soldiers, part of a garrison quartered upon the town without consent of the people. In December 1773 a cargo of tea, subject to a duty disliked by the colonists, was destroyed by being thrown into the harbor of Boston by a company of townspeople disguised as Indians. This episode is now widely known as "The Boston Tea Party" (q.v.). The port of Boston was closed in retaliation. The meeting of the General Court at Boston being postponed indefinitely, its members assembled at Salem. On 19 April 1775 the first blood of the Revolution was shed at Lexington not far from Boston, followed by the fight at Concord bridge. On 17 June occurred the battle of Bunker Hill at Charlestown, which, although counted as a British victory, exhibited the effective strength and stubborn power of resistance of the colonial forces, who, about 1,200 in number, resisted more than 3,000 British regulars, only giving way when after the third assault their ammunition failed. Throughout the war, Massachusetts took a prominent part, notwithstanding the emigration of a considerable number of loyalists to the Eastern British Provinces. She provided 67,907 troops and \$820,000 in revenue. At the close of the war, Massachusetts entered the Union, its State constitution being adopted in 1780 and the Constitution of the United States ratified January 1788. In the naval operations incident to the war with England in 1812, the seamen from Massachusetts won especial credit.

The State was closely identified with the anti-slavery movement by the growth within her borders of a strong popular sentiment in favor of abolition. William Lloyd Garrison (q.v.), Wendell Phillips, and many other prominent men, were influential in this movement.

In the War of the Rebellion the State furnished 159,165 men to the Union army and navy, paying in bounties and interest on bounty loans more than \$26,000,000, besides large sums in State and military aid. At the close of the war, the war debt of the State approximated \$15,000,000. In the recent war with Spain the patriotic record of the State was well maintained, its quota of men being promptly furnished, and among those first in the field.

Population.—The yearly rate of increase in the population of the State is about 2.5 per cent.

The industrial development of the last 30 years has stimulated the growth of factory towns and the population is now 76 per cent urban, that is, concentrated in cities and towns having 8,000 inhabitants or more. Since there are upon the average 348.9 persons per square mile of land surface the population is more dense than in any other State except Rhode Island. Although many persons born in Massachusetts have emigrated to other States, 299,614 such persons having been found in other parts of the country in 1900, nevertheless the loss has been more than compensated by accessions from abroad, from Canada, and indeed from adjacent States of the Union. The native born in the population numbered 1,959,022 and the foreign born 846,324. The increase in the native born in 1900 as compared with 1890 amounted to 23.8 per cent as against 28.8 per cent increase in the foreign born.

The number of foreign born does not of itself fully indicate the effect of immigration upon the population. This is more clearly shown by the number of persons of foreign parentage, which in 1900 aggregated 1,737,220, white persons only being considered. Less than a half of the inhabitants therefore are now of wholly native parentage.

The following table shows the place of nativity of the more numerous classes among the foreign born, and also the number of persons in the population having one or both parents born in the countries named:

PLACE OF BIRTH	Foreign Born Persons	Persons having one or both parents foreign born
Ireland	249,916	647,591
Canada (English).....	158,753	231,886
Canada (French).....	134,416	244,886
England	82,346	149,887
Sweden	32,192	49,595
Germany	31,395	71,831
Italy	28,785	41,771
Russia	26,963	40,712
Scotland	24,332	49,596
Poland	19,971	29,412

Of the entire population 98.7 per cent is white, the remainder being persons of negro descent, Chinese, Japanese, and Indians. The growth of population and its concentration have led to the incorporation of numerous cities, of which there are now 33, as against 320 towns. Although the towns numerically preponderate, nevertheless more than 67 per cent of the entire population is now under city government. Dense as the population is when considered in the aggregate this density is confined to the cities and towns engaged in manufacturing, or which share in the residential growth promoted by the metropolitan city of Boston, which of itself has extensive miscellaneous industries. The area of the cities and towns having a population in excess of 2,500 in 1900 is, approximately, 3,395 square miles, and the population within such places shows a density of 756.14 persons per square mile. Outside of these places there is in the Commonwealth an aggregate area of approximately 4,645 square miles of land surface, more than a half of the entire area of the State, containing a population of but 238,248 persons, or an average of but 51.29 persons per square mile. Every census since 1875 has shown a considerable increase in population upon the territory occupied by towns above the

MASSACHUSETTS.

STATE CAPITOL AT BOSTON.

MASSACHUSETTS

2,500 limit in 1900, and conversely, an almost constant decline in the towns outside this area. The towns which have lost are the smaller agricultural towns of the State, and while the increase in the percentage of foreign born, proportionately to the total population, has been greater in these places than in the other cities and towns, nevertheless the population in them remains to-day as in 1875 largely native born. The persons of foreign birth rapidly become assimilated and take their place in the social and political as well as in the industrial life of the State. The presence of this element has been due very largely to the industrial development of the Commonwealth, but that part of it which appears in the smaller towns is due to the taking up of agricultural land by persons of foreign birth.

Chief Cities and Towns.—The following table shows the cities of the State, arranged in order of size, with the population native born, foreign born, and total, from the census of 1900:

NAMES OF CITIES	POPULATION		
	Native Born	Foreign Born	Total
Boston	363,763	197,129	560,892
Worcester	80,769	37,652	118,421
Fall River	54,821	50,042	104,863
Lowell	53,995	40,978	94,969
Cambridge	61,420	30,466	91,886
Lynn	50,771	17,742	68,513
Lawrence	33,982	28,577	62,559
New Bedford	30,913	25,529	56,442
Springfield	47,679	14,381	62,059
Somerville	44,411	17,232	61,643
Holyoke	26,791	18,921	45,712
Brockton	30,579	9,552	40,063
Haverhill	28,645	8,530	37,175
Salem	25,054	10,902	35,956
Chelsea	22,869	11,203	34,072
Malden	24,151	9,513	33,664
Newton	23,519	10,068	33,587
Fitchburg	20,614	10,917	31,531
Taunton	21,806	9,140	31,036
Gloucester	17,353	8,768	26,121
Everett	17,454	6,882	24,336
North Adams	17,379	6,821	24,200
Quincy	16,237	7,662	23,899
Waltham	16,786	6,695	23,481
Pittsfield	17,422	4,344	21,766
Chicopee	11,028	8,139	19,167
Northampton	14,145	4,498	18,643
Medford	13,917	4,327	18,244
Newburyport	11,615	2,863	14,478
Woburn	10,414	3,840	14,254
Beverly	11,070	2,814	13,884
Marlborough	10,298	3,311	13,609
Melrose	10,038	2,924	12,962

Boston, the capital, is the chief city of the Commonwealth and ranks fifth among the great cities of the Union. Identified with the growth of the State from its beginning its historical landmarks are of profound interest to the visitor, and the traditions of the city, its development in modern times, its unrivaled suburbs distinguished by large numbers of tasteful and well-kept residences, its beautiful parks, public buildings, and points of literary and artistic interest, give it an important and in many respects a unique place among American cities. Other cities closely connected with the early history of the Commonwealth are Salem and Newburyport, located on the eastern coast in Essex County. Cambridge, near Boston, with which it is connected by several bridges spanning the Charles River, is the seat of Harvard Univer-

sity, and the former home of Longfellow and Lowell. Lowell and Lawrence upon the Merrimac, Fall River and New Bedford in Bristol County, and Holyoke in Hampden County, are all extensively engaged in textile manufacturing, Holyoke also, with Springfield, is especially interested in the production of paper of all grades. New Bedford was formerly the seat of the whaling industry now almost entirely abandoned. Lynn and Haverhill in Essex County and Brockton in Plymouth, are the centres of the boot and shoe industry. Worcester, the second city in point of size, well located near the centre of the State, is an educational centre as well, the seat of Clarke University and Holy Cross College, and is largely interested in high-class metal industries, and the manufacture of machinery. Waltham, in Middlesex County, is the site of a large watch-making establishment and has extensive textile factories. Northampton, in Hampshire, is the seat of Smith College for women. Woburn, in Middlesex, has large establishments for the production of leather. Gloucester, a seaport upon Cape Ann, is largely engaged in the fisheries. Quincy, in Norfolk County near Boston, has noted granite quarries. Fitchburg in Worcester County, Taunton in Bristol, North Adams and Pittsfield in Berkshire, Chicopee in Hampden, Beverly in Essex, and Marlborough in Middlesex, are all thriving cities with important industries; and Chelsea in Suffolk County, Everett, Somerville, Newton, Melrose, Medford, and Malden in Middlesex, are rapidly growing municipalities, largely residential, and closely connected with Boston within the metropolitan district.

Religion.—Originally, as elsewhere stated, Orthodox Congregationalism was the form of Church polity recognized by law. To-day all the principal denominations are represented. In respect to population, the Roman Catholics lead all others, more than 900,000 persons in the Commonwealth being of that faith. In church membership, the Orthodox Congregationalists rank next to the Roman Catholics, with approximately 115,000 members; followed by the Baptists (of whom there are several different bodies), with about 70,000; the Methodists (of different bodies), with about 60,000; the Unitarians, about 35,000; the Protestant Episcopalians, 30,000; and many other lesser bodies, of whom few, if any, exceed the limit of 10,000 in membership. In the value of church property, although recent exact statistics are not available, and conclusions must therefore be based upon estimates, the rank of the several denominations is the same except that the Roman Catholics change place with the Orthodox Congregationalists.

Government.—Originally based upon church membership, the conditions surrounding the suffrage have been subject to successive modifications. Dissenters from the Established Church were released from paying taxes for church purposes in 1815, and in 1833 all denominations were given equal standing before the law. Since the adoption of the original State constitution (1780) it has been twice revised by constitutional conventions held in 1820 and 1853. Numerous amendments to the original articles have been made, and new articles adopted from time to time. All male persons, 21 years of age and upward, able to read and write in the English language, and neither paupers, imbecile, or con-

MASSACHUSETTS

victs are entitled to vote. The State legislature, called the General Court, consists of the Senate, 40 members, and the House of Representatives, 240 members, elected for annual terms in Senatorial and Representative districts, respectively. Annual sessions are held beginning on the first Wednesday of January and continuing until prorogation after the completion of the business of the session.

The executive branch of the State government consists of a governor, lieutenant-governor, eight councillors who are the governor's constitutional advisers in the matter of appointments and other minor executive duties, and who are chosen in councillor districts, a secretary of the commonwealth, treasurer and receiver-general, auditor of accounts, and attorney-general. These officers are all chosen in a general election annually for annual terms. The governor is by virtue of his office commander-in-chief of the military forces of the State. He has a constitutional power of veto over the acts passed by the legislature, but, notwithstanding this, vetoed bills may be passed over the veto by a two thirds vote of both branches. Important executive functions are exercised by commissions of from one to three or more members, appointed by the governor, including among others the board of agriculture, the board of education, the commissioner of insurance, railroad commissioners, harbor and land commissioners, prison commissioners, the boards of health, lunacy, and charity, the board of conciliation and arbitration (dealing with labor disputes), the chief of the bureau of statistics of labor (controlling the census, social, and industrial statistics), etc. All judges are appointed by the governor and hold office during good behavior. The judicial system comprises police, district, and municipal courts, having original jurisdiction in minor civil and criminal cases, sometimes exclusive of the Superior Court and sometimes concurrent therewith; a Superior Court with original jurisdiction in higher cases, and original and concurrent jurisdiction with the Supreme Judicial Court; and a Supreme Judicial Court, which has general supervision over all courts of inferior jurisdiction, hears appeals, decides questions of law, etc. This court has also original jurisdiction in certain cases, and original and concurrent jurisdiction with the Superior Court in others. The Superior and Supreme Judicial Courts hold regular term sittings in the several counties. The judicial system also includes courts of probate and insolvency in each county, and there are trial justices, and justices of the peace, with limited jurisdiction.

Cities are incorporated by special legislative charter, the minimum population required being 12,000. City governments are administered by a mayor and city council. Towns are independent municipal bodies other than cities, the chief executive officers being the board of selectmen, elected in town meeting by those entitled to vote. The town meetings also make appropriations and decide, by vote, other important matters relating to the affairs of the towns.

The cities and towns are grouped into counties, 14 in number, namely, Barnstable, Berkshire, Bristol, Dukes, Essex, Franklin, Hampden, Hampshire, Middlesex, Nantucket, Norfolk, Plymouth, Suffolk, and Worcester. The

chief executive officers in the counties are county commissioners, elected annually.

Militia.—All able-bodied male citizens between the ages of 18 and 45 are in emergency liable to perform military duty. The present State militia force allowed by law consists of 484 officers and 6,115 enlisted men. These are organized in two brigades, the first consisting of one regiment of heavy artillery, one battalion of light artillery, one company of cavalry, two regiments of infantry, and a signal corps; and the second includes a battery of light artillery, a battalion of cavalry, three regiments of infantry, and a signal corps. There are also two corps of cadets, an ambulance corps, and a naval brigade.

Wealth, Debt, and Taxation.—Massachusetts is one of the wealthiest States of the Union. Much of the capital of its citizens is invested in enterprises out of the State. The value of real estate as fixed by the assessors of the various cities and towns for purposes of taxation was, at the date of the latest published return, \$2,434,898,295. The total personal estate returned from the same sources was \$680,527,992, but, with other legitimate additions, has been estimated at \$1,673,442,218, bringing the aggregate to \$4,108,340,513, and even this is probably an under-estimate. The debt of the State, less the amount of sinking fund applicable to its reduction, contracted for State purposes only, namely, loans for the construction of hospitals and other public buildings, the abolition of railway grade crossings, unpaid remainders of war debt, etc., amounts to \$13,472,628; but the Commonwealth is carrying temporarily an indirect indebtedness which, less sinking fund accumulation, amounts to \$52,491,378, this representing loans contracted for the benefit of certain municipalities and metropolitan districts, within which the credit of the State is pledged to aid the development of parks, water systems, sewerage construction, and armory construction, the communities benefited being assessed annually for the payment of interest and finally for the payment of the principal. The net debt of the State, direct and indirect, is thus \$65,964,006, although, as will be seen, the larger part of this is in point of fact municipal indebtedness authorized by the State legislature.

The aggregate tax levy for State, county, and municipal purposes, for the year covered by the latest report, amounts to \$50,827,713. Of this, \$1,608,217 is a poll tax assessed under a provision of law requiring the payment of such a tax, limited to \$2 per capita, by every male inhabitant of the Commonwealth above the age of 20 years, whether a citizen of the United States or an alien. The rate of local taxation in the different cities and towns, per thousand dollars of valuation, real and personal, varies from \$26 to \$5.50; rates from \$5.80 to \$9.80 being assessed in 13 towns; \$10 to \$14.90 in two cities and 119 towns; \$15 to \$19.80 in 30 cities and 143 towns; and \$20 to \$25 in one city and 43 towns. Under the tax system of the State, real estate is taxed to the owner wherever residing, the tax being payable in the city or town where the estate is located. Personal property taxes are payable in the town where the holder resides. Corporations are subject to a tax upon their capital stock, assessed and payable through the office of the State Commissioner of Taxation, the proceeds being distributed to the municipalities wherein the stock-

MASSACHUSETTS

holders reside, in proportion to the amount of shares held by them respectively. Shares in such corporations are therefore exempted from local taxation. Real estate and personal property in general is, on the other hand, subject entirely to local assessment, and, theoretically, at its full value. Incomes in excess of \$2,000 are taxable. Property held solely for religious, charitable, or educational purposes, is exempt from taxation.

Banks.—The latest published return of the controller of the currency covering the year 1902 report the number of national banks in the State as 241; of these 34 are in Boston. The aggregate capitalization of the national banks is \$73,187,000; the circulation, \$21,883,000; the loans, \$285,841,000; deposits, \$231,856,000; the total assets being \$468,791,000.

Loan and trust companies number 36, the capital stock aggregating \$13,225,000; the surplus fund, \$11,129,000; undivided profits, \$4,078,068; deposits, \$127,928,218; and the total resources \$159,926,206. On 30 June 1902 the aggregate resources of all banks, including national and savings banks and trust companies, amounted to \$1,222,133,895, or an average per capita upon the estimated population of \$417.82; the per capita average being by classes as follows: National banks, \$159.35; loan and trust companies, \$54.67; savings banks, \$203.80.

The banks for savings are governed by a carefully guarded statute, and these institutions as well as co-operative banks (co-operative savings and loan associations) and trust companies are under the supervision of the state commissioners of savings banks. The savings banks, at the close of the year covered by the latest published return, numbered 186, the number of deposit accounts being 1,660,814; amount of deposits, \$586,937,084, the increase over the previous year being more than \$26,000,000. The average amount to each account was \$353.40, the deposits amounting, on the average, to \$192.63 to each person of the population. The savings banks throughout the State have been managed conservatively and very few losses have occurred; but the expense of management is remarkably low, the percentage of expense to total management being but .00234. The co-operative savings banks, which are really building associations, receiving deposits from their members in regular monthly payments, accumulating interest thereon, and loaning the amounts received to members only, principally upon first mortgages on real estate, have been uniformly successful and now number 130, the assets aggregating \$30,391,665. The Massachusetts statute governing these institutions is a model in legislation of this kind, carefully protecting the interests of the members, who, by the method of regular savings inherent in the system, are gradually accumulating considerable sums in cash, or acquiring home ownership.

In their relation to commerce, the financial interests of the State are largely centred in Boston. The first bank in this city, one of the earliest institutions of the kind in the country, was established in 1784 and still continues. Banking operations here have generally been conducted with conservatism and prudence. Since 1898 the aggregate banking capital invested in the city has been much reduced, and weak banks eliminated or strengthened by consolidation. The clearing-house exchanges for

the year covered by the latest returns amount to \$6,912,674,641.

Education.—From the earliest years the education of the people has been a vital subject of public concern. Harvard College at Cambridge was founded in 1636, and as early as 1647 it was provided in the colonial laws "to the end that learning may not be buried in the graves of our forefathers" . . . "that every township after the Lord hath increased them to the number of fifty households, shall appoint one to teach all children to write and read; and when any town shall increase to the number of one hundred families, they shall set up a grammar school, the master thereof to be able to instruct youth so far as they may be fitted for the University; provided that if any town neglect the performance hereof above one year, that every such town shall pay five pounds to the next school, till they shall perform the order." The spirit of this early law still continues. It has always been the policy of the Commonwealth to preserve the principle of local control of the schools, thus promoting the direct interest of the taxpayers in the several municipalities. Hence while the State law provides under penalty that schools shall be maintained in every city and town, these are administered by local boards termed school committees, elected by the people and clothed with broad general authority. Women, as well as male voters, may vote for the election of these officers. The State Board of Education, appointed by the governor, has advisory powers, intended to foster and promote the highest efficiency of the public schools, but no direct control of local schools, except in certain matters of general concern, such as the distribution of the income of the State school fund in aid of the schools in the poorer towns. This board through its agents exercises limited supervisory authority wherever aid is thus furnished. The board also directly administers the State normal schools established for training teachers. Such schools exist at Framingham, Westfield, Bridgewater, Salem, Worcester, Fitchburg, North Adams, Hyannis, and Lowell, besides a State Normal Art School at Boston, expressly devoted to the training of teachers in drawing and the arts of design. The buildings provided by the State for normal instruction are of the highest character, of modern construction, and all full equipped. The number of pupils in attendance approximates 1,700, and of 13,905 teachers employed in the public schools during the year covered by the latest published return, 6,498, or 46 per cent, had received normal instruction.

School attendance is compulsory between the ages of 7 and 14, and public schools must be maintained at least 32 weeks in every year, except that in towns under the valuation of \$200,000 the time may, by consent of the board of education, be reduced to 28 weeks. Cities and towns containing 500 families must maintain high schools as well as those of lower grade. Towns not subject to this requirement must pay for the tuition of their children who attend the high school of some other municipality, but sums so paid are reimbursed by the State to towns whose valuation does not exceed \$500,000. Cities and towns containing 20,000 inhabitants or more must maintain manual training in their schools. Towns may establish industrial schools, and any town may, and if of 10,000 inhabitants or

MASSACHUSETTS

more must, maintain annually evening schools for the instruction of persons over 14 years of age in elementary branches, and evening high schools must be maintained in cities of 50,000 or more inhabitants. The education of the children is further promoted by stringent provisions of law prohibiting under any circumstances the employment for wages of any child under 14 during the hours when the public schools are in session, and, unless certain educational requirements are met, of those under 16, in factories, workshops, or mercantile establishments. The number of children attending the public schools during the year covered by the latest published returns, was 474,234; the average membership, 415,533, and the average attendance 380,026, or 92 per cent of the average membership. At the same time there were 341,334 children in the State between the ages of 7 and 14. Of these, 299,065 were enrolled in the public schools, and the enrolment in private schools was 87,337. Evidently the law requiring school attendance is well enforced.

The total annual expenditure for public school purposes for the same year was \$15,132,133, of which \$3,442,063 was for school buildings. Of the whole amount 97 per cent was derived from local taxation. The average cost to the towns in taxation was \$27.10 for the school support of each child in the average membership, requiring an expenditure of \$3.70 for each \$1,000 of the State's valuation, or about 23 per cent of the average tax for all municipal purposes. The effective ventilation of school buildings is required under definite provisions of law enforced by the State inspector of factories and public buildings, and in the larger towns and cities these buildings are generally of the highest types of such edifices in this and in all other respects, large numbers having been erected within recent years. Under a law which went into effect 1 July 1902, every city and town must employ a superintendent of schools. Towns under a valuation of \$2,500,000 each must effect unions, under specified conditions for this purpose. The minimum salary of the superintendent within such a union is fixed at \$1,500, of which the State pays half.

The higher educational institutions within the State include the following: Harvard College (q.v.) at Cambridge, founded 1636; Williams College (q.v.) at Williamstown, 1793; Amherst College (q.v.) at Amherst, 1825; Mount Holyoke College (q.v.), for women, at South Hadley, 1837; College of the Holy Cross at Worcester, 1843; Tufts College (q.v.) at Medford, 1850; Massachusetts Institute of Technology at Boston, 1861; Boston College at Boston, 1863; Massachusetts Agricultural College at Amherst, 1863; Worcester Polytechnic Institute at Worcester, 1865; Boston University at Boston, 1869; Wellesley College (q.v.), for women, at Wellesley, 1870; Smith College (q.v.), for women, at Northampton, 1871; Clark University at Worcester, 1887; and Simmons College at Boston, 1902. Radcliffe College at Cambridge, having certain affiliations with Harvard but no legal connection with it, is devoted to the collegiate education of women, and there are also many seminaries and private schools of various grades in the State.

Libraries.—Free public libraries form an important element in the educational equipment of the State. These institutions, free to all the

citizens in the various cities and towns, are practically universal, only a fractional percentage of the population being without such privileges. The establishment of such libraries has in recent years been fostered by grants of money from the State treasury, and by the creation of a Free Public Library Commission, appointed by the governor, established to promote public library usefulness and to aid in founding such institutions where not then existing. This commission makes annual reports to the legislature upon matters within its jurisdiction. There are also numerous circulating and association libraries, not free to the public. The latest returns from all classes of libraries within the State, both secular and religious, show 2,028 libraries, containing 7,367,764 volumes, valued at \$9,873,700, and having a circulation for home use of 8,461,276 volumes. These figures, however, are from the State census of 1895 and are undoubtedly much below the present totals. The Boston Public Library, housed in a building which is one of the most noteworthy architectural monuments in the United States, is the largest free public circulating library in the country, and contains nearly 900,000 volumes; the Harvard University library has more than 500,000; the Boston Athenæum, 210,000; and the public libraries at Springfield, and Worcester, the State Library in the State House at Boston, and that of the American Antiquarian Society at Worcester, each exceed 10,000 volumes. (See LIBRARIES.)

Charitable and Penal Institutions.—The State institutions dealing with the defective classes include hospitals for the insane at Worcester, Taunton, Northampton, Danvers, and Westborough, and the Insane Asylum, so-called, at Medfield. The government of these institutions is in each case vested in a board of seven trustees, of whom five must be men and two women, one to be appointed annually by the governor and council, the place of the senior member being vacated each year. The Massachusetts Hospital for Epileptics at Foxborough is also controlled by seven trustees appointed in the same manner. By a law enacted in 1900 provision is made for a State Colony of the Insane, managed by a similar board of seven trustees. The Massachusetts School for the Feeble-minded at Waltham is governed by six trustees appointed by the governor for three-year terms. The Hospital Cottages for Children at Baldwinville has five trustees; the Massachusetts Hospital for Dipsomaniacs and Inebriates at Foxborough, five trustees; the Massachusetts Charitable Eye and Ear Infirmary at Boston, two trustees on behalf of the State; the Massachusetts General Hospital, four trustees on behalf of the State; the Massachusetts Homœopathic Hospital at Boston, five trustees on behalf of the State; the Massachusetts State Sanatorium at Rutland (for consumptives), five trustees; all these trustees being appointed for fixed terms by the governor. The Perkins Institution and Massachusetts School for the Blind at South Boston, has four trustees on behalf of the State, similarly appointed; and the Soldiers' Home at Chelsea, three. There are special educational institutions for the deaf in which the State is interested and to which educable children of this class may be sent, in accordance with the policy of the Commonwealth which makes schooling free for all its

MASSACHUSETTS

children even when physical defects of this nature forbid their attendance upon the public day school. These comprise the American School for the Deaf at Hartford, Conn.; the Clarke School for the Deaf, Northampton; the Horace Mann School for the Deaf, Boston; the Sarah Fuller Home for Little Deaf Children, Medford; the New England Industrial School for Deaf Mutes, Beverly; and the Boston School for the Deaf.

The penal and reformatory institutions include the Lyman School for Boys at Westborough; the State Industrial School for Girls at Lancaster, both controlled by trustees appointed by the governor; the State Prison at Boston (Charlestown District); the Massachusetts Reformatory at Concord; and the Reformatory Prison for Women at Sherborn, all controlled by the State Board of Prison Commissioners.

The State institutions for paupers include the State Hospital at Tewksbury and the State Farm at Bridgewater.

The local poor, having settlements under the law in the cities and towns, are cared for in local almshouses maintained by the municipalities. There are jails, houses of correction, and truant schools in the counties. The charitable institutions established and maintained by religious bodies or other private agencies are widely distributed; and, especially, hospitals for the treatment of accidents and disease, and homes for the aged have, in recent years, been numerously established throughout the Commonwealth.

By the latest published returns, covering the year 1902, the total number of paupers of all classes is 13,684, including 4,140 State poor, 5,044 city and town poor in local almshouses, and 4,590 pauper insane. The total cost of pauper maintenance for the year was \$3,743,134, or \$1.266 to each inhabitant of the State. For the same year the whole number of insane persons in the State was 9,386, distributed as follows: in public institutions, 8,271; in private institutions, 265; boarded out, 124; under the charge of overseers of the poor in local almshouses and private families, 726. (See PAUPERISM.)

The total prison population 30 Sept. 1902 aggregated 6,336; of whom 3,593 were confined in county jails and houses of correction, and 2,743 in the State prisons.

Vital Statistics.—Upon the estimated population of the State, the birth rate per 1,000 of persons living, for the year 1901, the latest for which complete figures are available, was 25.07; the marriage rate 8.67; and the death rate 16.82, the excess of births over death per 1,000 of persons living being 8.26. The death rate is slightly higher in the cities than in the towns. The total number of deaths for the year was 48,275, the number under each of the principal classified causes being as follows: from general diseases, 13,930; diseases of the nervous system and organs of special sense, 6,517; of the circulatory apparatus, 4,891; of the respiratory apparatus, 6,876; and of the digestive apparatus, 5,438.

Manufactures.—The State is largely devoted to manufacturing, the energies of its people having been early turned in this direction, and developed by more than a century of industrial training. No special advantages exist based upon the possession of raw material, or due to

natural resources, except water power, which, although changes in the methods of developing power render this less essential than formerly, is still an important factor. The climate of the southeastern part of the State is especially favorable to cotton spinning. In colonial days much was done to foster manufactures, invention has been promoted, and improved craftsmanship stimulated, and the effect has been significant throughout the industrial history of the State. The power loom, first constructed by Francis C. Lowell of Boston and Paul Moody of Amesbury, and put in operation at Waltham in 1814, revolutionized the cotton industry in the United States. The first cotton mill in the country was built at Beverly in 1788. As early as 1815 there were 57 cotton mills in the State with 46,650 spindles. The first attempt at woolen goods manufacture was at Rowley, in Essex County, in 1643, followed by more or less successful efforts in the same direction elsewhere in the State in the 17th and 18th centuries. The industrial history of Lowell, Lawrence, and Fall River is, in effect, the history of the growth of the factory system as applied to textiles in America. The boot and shoe industry developed from crude hand process of early times to the perfected factory operations of to-day, is interwoven with the story of the growth of Lynn, Haverhill, Brockton, and many smaller municipalities. The first printing done in the American colonies was at Cambridge in 1639; and from this small beginning onward the printing and publishing business has been important in the State. Much of the history of paper-making in the United States is the history of the industry in Massachusetts. The manufacture of india rubber goods in this country originated at Roxbury, now part of Boston, in 1833. Manufactures of metal, machinery of all kinds, wooden goods, jewelry, clothing, cordage, rattan and other furniture, have always been important.

In textiles, the most important industrial group shown in this table, the cotton industry leads with a product value of \$111,125,175. The spindles employed in this industry number 7,784,687, increasing 1,960,169, or 33.7 per cent, since 1890, being 40.6 per cent of the total increase in the country. In 1900 Massachusetts had 41 per cent of all spindles and 39.8 per cent of all looms employed in the cotton factories of the United States, and was first in rank among the States in the manufacture of cotton goods. The State led all others in the manufacture of worsted goods, the annual product reaching \$40,557,363; and in woolen goods, the product being \$30,888,104. It also holds first place in the boot and shoe industry, the figures being shown in the table. It has long been first in the manufacture of fine writing papers, the value of this product in 1900 being \$11,298,628, or 71.1 per cent of the total produced in the United States. The paper used by the national government for currency and bonds is produced within the borders of Pittsfield but near the Dalton line in a mill especially devoted to its manufacture. In the production of rubber boots and shoes the State ranks first, and in the manufacture of jewelry is preceded only by Rhode Island and New York. The labor employed in the factories of the State is highly skilled, its operations well organized, and its productive capacity correspondingly high. Labor difficul-

MASSACHUSETTS

ties have not been numerous nor protracted. The factory legislation, as a whole, is in advance of other States, and is well enforced, being supported by an effective public opinion. The laws against the employment of children are especially stringent, and such employment is reduced to small proportions. There exists an efficient State factory inspection department, with headquarters in the State House, and a corps of district inspectors covering all parts of the Commonwealth.

The following table shows the returns, according to the census of 1900, of all industries in the aggregate and of the principal industries in detail:

and poultry valued at \$1,018,119. The total value of domestic animals on farms was \$14,730,169. The number of persons engaged in agriculture, not including lumbermen and woodchoppers, was 65,692, those classed as agricultural laborers numbering 31,515. The farms operated by owners constituted 90.7 per cent of the whole number, only 9.3 per cent being carried on by tenant farmers. Of the families residing on farms, 84.9 per cent resided on owned farms. The amount expended during the year for farm labor aggregated \$7,487,280. The farms classified upon the basis of the principal source of income are as follows: Hay and grain, 3,284; vegetables, 3,117; fruits, 1,286;

Agriculture.—The agriculture of the State, as compared with that of the great farming States of the West, is not important. The industry has always been secondary to manufacturing. Following the lines of least resistance, it has turned chiefly to the production of milk, eggs, poultry, and such vegetables as find a ready market in the growing factory towns and cities almost at the farmer's door. Considered from this standpoint and measured by the value of the product annually sold, no decline is shown in recent as compared with earlier years. For example, the total value of product for the year covered by the United States census of 1900 was \$42,298,274, as against \$28,072,900 returned 10 years previously. The returns in the State census are more favorable than those secured in the national enumeration, since taken in the autumn and possibly with greater care; but inasmuch as comparisons with other States can only be made by using the national figures, they will be relied on here. The total number of farms returned is 37,715; and the total acreage 3,147,064, of which 1,292,132 is improved. The farm property is valued as follows: Land and improvements, except buildings, \$86,925,410; buildings, \$71,093,880; implements and machinery, \$8,828,950; live stock, \$15,798,464. The animals upon the farms in the State, 1 June 1900, included 285,944 neat cattle; 75,034 horses; 18,600 lambs (under 1 year); 33,869 sheep (1 year and over); 78,925 swine;

live stock, 8,193; dairy produce, 14,900; tobacco, 632; flowers and plants, 597; nursery products, 49; miscellaneous, 5,657. The State ranks seventh among the States with respect to the number of farms which derive their principal income from dairy produce. The total dairy product for the year amounted to \$12,855,744, the amount sold being \$11,468,784, the remainder being consumed on the farms. The value of milk sold was \$9,711,380; cream, \$870,833; butter, \$884,575; and of cheese, \$1,996. The total value of poultry raised during the year was \$1,407,681; and the egg product aggregated 12,928,630 dozen. Only 53,385 acres were devoted to cereals, the product for the year being valued at but \$922,127, or only 4.3 per cent of the total crop value. Of the principal cereals the acreage and bushels produced are as follows: Corn, 39,131 acres, 1,539,980 bushels; oats, 6,702 acres, 240,990 bushels; rye, 4,557 acres, 60,294 bushels; barley, 638 acres, 14,087 bushels; buckwheat, 2,262 acres, 36,034 bushels; wheat, 95 acres, 1,750 bushels. The acreage devoted to hay and forage crops, exclusive of cornstalks, was 610,023, and the tons produced, 848,950. Certain sections of the State are devoted to special products of considerable importance. Among these are tobacco raised in the Connecticut Valley, cranberries in Barnstable County, and general market produce in parts of Middlesex County near Boston.

The Fisheries.—The fishing industry has,

MASSACHUSETTS

from the earliest years, been an important element in the prosperity of the coast towns and the hardy seamen of Gloucester and Marblehead, engaged in this industry in times of peace, have won renown in the naval operations of the country in times of war. The latest complete returns relating to the fisheries of the State show a working capital invested, including apparatus and supplies, of \$5,338,828, and the following annual product: Food fish, \$4,647,914; fish products, \$122,327; food fish products, \$9,923; shell fish, \$546,351; whale and seal products, \$351,613; other products, \$25,015; aggregating \$5,703,143. The total number of fishermen is returned as 11,093, including officers and crew. Of the investment, 60.84 per cent, and of the product, 56.34 per cent, is credited to the city of Gloucester; New Bedford having 10.24 per cent of the investment and 5.49 per cent of the product; Provincetown, 6.17 per cent of the investment and 7.62 per cent of the product; Boston, 5.43 per cent of the investment and 8.92 per cent of the product; and the remainder being distributed among a number of other cities and towns.

Commerce.—By the latest statistics, the investments in coastwise and ocean commerce under the American flag include in an aggregate of \$14,394,432, the following details: Buildings and fixtures, \$313,235; cash capital, \$1,150,870; credit capital, \$94,040; land, \$352,414; vessels, including outfit, \$12,220,132; and wharves, \$263,741. These figures are undoubtedly below the actual, owing to deficiencies in the returns, and to the natural increase since they were secured. The same statement applies to earnings which are returned as follows: From freight, \$7,253,503; from passengers, \$2,085,818; aggregating \$9,339,321.

Boston, of course, is the chief port of entry, and in the aggregate value of investments and earnings derived from ocean commerce exceeds all others. The city is extensively engaged in European commerce, much of which is conducted under foreign flags. Lines of passenger and freight steamers regularly ply between Boston and European ports, and the coastwise passenger and freight traffic to the east and south is important. For the year covered by the previous returns, the commerce, under foreign flags, credited to Boston, included 61 vessels, the aggregate investment being \$14,464,000; and the earnings from freight, \$4,775,985; from passengers, \$1,238,089; in the aggregate, \$6,014,074.

Railroads.—Transportation facilities have kept pace with the industrial development of the State. Boston, the metropolis, is connected with the West by two railway systems, and these communicate either directly or by branches with all the leading industrial centres. One general system, with its various divisions, communicates with the South by way of New York, uniting important manufacturing cities and towns, while a network of main and branch lines connects the northern and eastern factory centres of the State with each other, with the seaboard, and with the railway systems leading south and west. There are in the State 2,107 miles of main and branch railroad line, besides 939 miles of second, third, and fourth main track, and 1,391 miles of side track, making the total length of railroad track within the State 4,437 miles. Ten companies in all are operating, but three of these,

the Boston and Albany (New York Central and Hudson River, lessee), Boston and Maine, and the New York, New Haven and Hartford, operate over 96 per cent of the railroad mileage, and conduct nearly 98 per cent of the entire passenger and freight traffic. The gross assets of the companies, 30 June 1902, aggregated \$418,298,274, and the gross liabilities, \$383,106,669. The total income for the year aggregated \$99,375,022, and the total expenditures \$98,757,945, including dividend payments. Electric street railways have multiplied during the last 10 years, and they now connect all of the principal cities and towns. In the city of Boston subway and elevated railway construction of the highest class, completed and in process, has already transformed the methods of street transit, and will finally solve the problem of rapid communication between different parts of the city and its suburbs. The Massachusetts street railway companies now own, according to the latest published returns, 2,111 miles of main track, 333 miles of second main track, and 147 miles of side track, these aggregating 2,591 miles. The gross assets of these companies aggregate \$123,200,558, and the gross liabilities, \$119,441,792. The total income for the year amounted to \$24,918,161, and the total expenditures to \$24,668,021.

Bibliography.—*Historical:* Hutchinson, 'History of Massachusetts' (1764-7); Barry, 'History of Massachusetts' (1855-7); Savage, 'Winthrop's History of New England' (1825-6); Young, 'Chronicles of the Pilgrim Fathers' (1841), and 'Chronicles of Massachusetts,' (1846); Schouler, 'Massachusetts in the Civil War' (1868-71); Drake, 'The French and Indian War' (1870); Adams, 'The Emancipation of Massachusetts' (1887); Goodwin, 'The Pilgrim Republic' (1888); Ellis, 'The Puritan Age and Rule in the Colony of the Massachusetts Bay' (1888); Fiske, 'The Beginnings of New England' (1889); Adams, 'Three Episodes of Massachusetts History' (1892); and 'Massachusetts: Its Historians and Its History,' (1893); Byington, 'The Puritan in England and New England' (1896); Howe, 'The Puritan Republic' (1899). There are numerous local, town, and county histories, among them, Holland, 'The History of Western Massachusetts' (1855), and Winsor, ed. 'The Memorial History of Boston' (1880). Among popular compendiums see Powell, 'Historic Towns of New England' (1901), and Bacon, 'Historic Pilgrimages in New England' (1898). The published collections of the Massachusetts Historical Society contain invaluable material, not otherwise readily accessible, relating to the early history of the Commonwealth. *Scientific:* Hitchcock, 'Report on the Geology, Mineralogy, Botany, and Zoology of Massachusetts' (1833); 'Final Report on the Geology of Massachusetts' (1841); 'Ichthyology of New England' (1858); and supplement to the same (1865). The following are official reports: 'Fishes, Reptiles and Birds of Massachusetts' (1839); 'Herbaceous Flowering Plants of Massachusetts' (1840); 'Invertebrata of Massachusetts' (1841); and Emerson, 'Trees and Shrubs of Massachusetts' (1875). *Public Documents:* The Census Reports of the United States; Reports of the Decennial State Census; Annual Reports on the Statistics of Manufactures and on the Statistics of Labor, Bulletins, etc.; issued by the State Bureau of Statistics of Labor; Annual Re-

ports of the Board of Education, and of the Commissioners on Railroads, Savings Banks, Lunacy, Charity, Prisons, Agriculture, etc.; Reports of the Treasurer and Receiver General, the Auditor, and Reports upon Vital Statistics, and upon Polls, Property, and Taxes, issued by the Secretary of the Commonwealth.

HORACE G. WADLIN,
Librarian, Boston Public Library.

Massachusetts Agricultural College, at Amherst, Mass., a coeducational institution, chartered in 1863 and opened in 1867 by the State. The college farm is 400 acres in extent, about 100 acres of which are devoted to horticulture, and 200 acres to farming. The work is experimental on the part of the students. The regular course extends over four years, but special courses are given for women desiring to study dairying, market gardening and some other subjects. Winter courses are provided for those unable to take the four years' work. The regular courses lead to the degrees B.S., M.S., and Ph.D. In 1903, the number of instructors was 24, and the students in attendance about 165. The library had about 24,000 volumes; the buildings and grounds were valued at \$265,000 and the equipment at \$115,000.

Massachusetts Bay, an arm of the Atlantic indenting the eastern shore of Massachusetts, and extending from Plymouth Harbor on the south to Cape Ann on the north, a distance of 42 miles. It is triangular in shape, the north and south shores inclining toward each other until at the entrance to Boston Harbor they are about five miles apart. The depth from the base of the triangle to Boston Harbor is about 21 miles. The northern shore is rocky and irregular, the southern low and sandy. The principal inlets are: on the north coast, Gloucester and Nahant bays and Salem, Marblehead and Lynn harbors, and on the west Boston Harbor. Along the shores are a number of capes and headlands, and off the coast a number of small islands. At the entrance to Boston Harbor there are several islands, on some of which are fortifications. Cape Cod Bay on the southeast is sometimes included in Massachusetts Bay.

Massachusetts Bay Colony. See MASSACHUSETTS, *History*.

Massachusetts Historical Society. See AMERICAN HISTORICAL SOCIETIES.

Massachusetts Institute of Technology, The, was founded in 1865, at the close of the Civil War, when the need was beginning to be felt for schools which should train men to deal with the new industrial problems. It was the plan of President Rogers, and of his co-workers, to establish a school which should give a thoroughly practical training in the application of scientific principles to practice in the arts, but not primarily training in mere technics, in the narrow sense. Accordingly they planned that each of its courses should embrace enough general studies to impart the elements, at least, of a liberal education; and, above all, they laid down that the most truly practical training, even in an industrial sense, must be grounded in a thorough knowledge of scientific laws.

Founded on these principles, the Institute of Technology began a career of steady development. To-day it is the largest school of its class in the United States, the widest in scope

of instruction, and in many respects the best equipped. The total number of its students, in 1902-3, was 1,608, the total number of instructors 183. The number of graduates in the class of 1902 was 193. Though 58 per cent of the students come from Massachusetts, among the remainder are found residents of 41 States of the Union, and of 18 foreign countries. In all 35 classes have graduated, aggregating over 2,700 persons. Except in seasons of financial depression, the demand for these graduates is always in excess of the supply.

The undergraduate studies of the school are divided into 13 distinct courses, each of four years' duration, and leading to the degree of Bachelor of Science. The four-year courses are Civil Engineering, Mechanical Engineering, Mining Engineering, Metallurgy, Architecture, Chemistry, Electrical Engineering, Biology, Physics, General Studies, Chemical Engineering, Sanitary Engineering, Geology, and Naval Architecture. Between the departments which maintain these several courses there is the closest connection and mutual support. Consequently, the instruction is specialized to a degree which would be impossible in a smaller college, with a less numerous staff of instructors. Again, the instructors, though connected in a special sense with one department, are giving instruction, it may be, to students from many others. This mutual helpfulness of the departments is seen first in the fundamental subjects, such as chemistry in the first year, and physics in the second, which are given to several courses or to all. It is seen again, in the large number of optional lines of work offered. Within most of the regular courses the student is allowed considerable latitude of choice, in the later years of his study, and may thus select that group of studies which is best adapted to the particular branch of his profession for which he is preparing.

The Institute occupies at present eight buildings devoted exclusively to instruction. The most interesting aspect of the equipment is the extensive laboratories. Many of them, when first instituted, represented an attempt to apply the laboratory method in a way up to that time unknown in the history of scientific instruction in this country. The laboratories of physics and of chemistry were the first to offer laboratory instruction in these subjects to students in large classes; and the mining and metallurgical laboratories, the steam laboratory, and the laboratory for testing the strength of materials also represent a marked advance over previous methods, either in the subjects taught or in the scale on which the work is done.

The extensive and highly specialized equipment of these laboratories cannot here be adequately described. In the 21 separate laboratories devoted to chemistry, for instance, there are, besides the larger general laboratories, smaller rooms for volumetric analysis, organic chemistry, air, water and food analysis, the analysis of oils and gases, the optical and the chemical examination of sugars and starches, and the determination of molecular weights. There are also the industrial chemical laboratories, which include a special laboratory for textile coloring, with printing machines, baths, dryers, and the like. The engineering laboratories, which provide facilities for practical work in steam engineering, hydraulics, cotton machin-

MASSAGE — MASSASOIT

ery, and the testing of materials, occupy a floor space of 21,380 square feet. The equipment of the steam laboratory, to speak of that alone, is exceptional, including a 150-horse-power, triple-expansion Corliss engine, the first of its kind of practical size ever arranged for experimental purposes; a second engine of 225 horse-power, transferring its power through a rope drive; a number of small engines for experiments and the study of valve-setting; gas engines, hot air engines, and other apparatus. The new Lowell Laboratory of Electrical Engineering covers an area of 45,000 square feet, and embraces a laboratory for electrical measurements, photometer rooms, and a main power and testing floor 300 feet in length by 40 feet in width. The new laboratory offers facilities for instruction and research which are unsurpassed in this country or abroad.

With this unusual laboratory equipment, it has been possible for the Institute to do much of its experimental work on a scale approaching that of industrial operations. The laboratories of mining and metallurgy, for instance, are designed to treat ores in quantities approximating those used in actual practice, and ranging from 500 pounds to 3 tons, and the contributions to the literature of ore-dressing and metallurgy from this laboratory are well known. In the laboratory for testing the strength of materials, again, were conducted the first systematic and extended tests of beams of commercial size.

Throughout all the work of the Institute the aim of instruction is so to adjust the theoretical and experimental work that the acquirement of principles in the class-room shall prepare the student for his laboratory exercises, and that these in turn shall fix methods and results in his memory, and give him capacity for new experimentation. Throughout it is intended to guide the student rather than to instruct him, and, whether in the four-year courses above described or in the graduate courses with which these may be supplemented, he is trained to work with less and less dependence upon his teachers. This training should result in a considerable increase in his power of ascertaining facts and overcoming difficulties, and so should increase his capacity for research.

N. I. TYLER,

Secretary Massachusetts Institute of Technology.

Massage, a procedure, usually performed by the hands, such as friction, kneading, rolling, and percussion of the external tissues of the body, either to relieve pain or to assist a cure, or with some hygienic object in view. A male massagist is known as a masseur, a female as a masseuse. Massage in some crude form has always been used by savages as well as by the civilized. It was one of the luxuries of the ancient Greeks and Romans, was largely used by gladiators, and to make slaves more comely by filling out their tissues. Sometimes it was done by medical practitioners, often by slaves and priests and those appointed to anoint the wrestlers before and after they exercised. Hippocrates, who employed rubbing to restore the free movement of blood and other fluids, says that "rubbing can bind and loosen, can make flesh, and cause parts to waste; hard rubbing binds; soft rubbing loosens; much rubbing

causes parts to waste; moderate rubbing makes them grow." Manual treatment of the body was long ago practised by the Chinese, and the Japanese, Turks, Egyptians, and people of various nationalities have employed it in some form from early times.

Often the use of massage is associated with that of certain active and passive movements known as the Swedish movement-cure (q.v.), established by Pehr Henrik Ling (q.v.). His system of gymnastics became popular in spite of opposition and of the fact that it was largely a revival of old methods of treatment. In 1873 Mezger, of Amsterdam, and in 1877 S. Weir Mitchell of Philadelphia, pushed forward the cause of massage. To-day it is considered by physicians as a branch of medical treatment, useful in certain cases if rightly administered, but capable of doing harm when improperly applied. Unfortunately the laity frequently look upon it as a sole means of relief or cure. The procedures in massage may be placed under four heads: stroking (the *effleurage* of the French), kneading (malaxation), friction, and percussion. Stroking is performed over surfaces with the palm of the hand or its radial border, or with the pulps of the fingers, or the sides of the knuckles. Kneading is the grasping of muscles, etc., with both hands or between the thumb and fingers of one hand, and rolling and squeezing them. Friction is a peculiar and forcible circular rubbing. Percussion is the striking or beating of a part, either with the hand or an instrument called a percussor or muscle-beater. It is claimed that the modern system of massage makes the blood circulate more freely, strengthens muscle-fibres, causes effusions and exudations to be absorbed, improves secretory and excretory action, and invigorates the whole system. It is frequently used with good results to stimulate assimilation and invigorate digestion, to soothe nervous irritability, relieve pain, and arouse nerve-force, to equalize the circulation, to remove morbid deposits from around joints, to restore mobility, and for the correction of obstinate constipation and other disordered conditions.

Massagetæ, mə-săj'ě-tě, in ancient history, a name given to nomadic tribes of northern Asia who dwelt to the east and south of the Caspian Sea. Herodotus says they worshipped and offered horses to the sun, had a community of wives, killed and ate their aged people, lived chiefly on the milk and flesh of their herds and on fish, and fought on foot and on horseback with lance, bow, and double-edged axe. They are chiefly mentioned in connection with Persian history. According to some they belonged to the Mongolian stock, according to others to the Aryan.

Massasoit, măs'a-soit, American Indian chief, sachem of the Wampanoags; b. Massachusetts 1580; d. 1661. His dominion extended over nearly all the southern part of Massachusetts, from Cape Cod to Narraganset Bay; but his tribe, once estimated at 30,000 in number, had shortly before the landing of the pilgrims at Plymouth been reduced by a disease, supposed to have been yellow fever, to barely 300. On 22 March 1621, a little more than three months after the founding of Plymouth, he appeared before the infant settlement with 60 of his warriors, armed and painted, for the purpose of forming

a friendly league with the white men. Although the tribe were reputed to be cruel and treacherous, the open and friendly greeting of Massasoit so favorably impressed Gov. Carver, that after the necessary formalities were concluded, he formed in behalf of the colony a treaty of peace and mutual protection with the Wampanoags, which for 50 years was sacredly kept by both parties. The friendly disposition of Massasoit toward the colonists never relaxed. He lived within the limits of what is now the town of Warren, R. I., near an abundant spring which yet bears his name, where he often entertained wandering pilgrims or administered to their necessities. Roger Williams, while on his way to Providence, was for several weeks his guest at this place. Massasoit was just, humane, and honest, never violating his word and constantly endeavoring to imbue his people with a love of peace. In person, Morton says, in his 'Memorial,' he was "a portly man in his best years, grave of countenance, spare of speech." His second son, Pometacom, called by the colonists King Philip, who ultimately became sachem of the Wampanoags, was of a less placable disposition, and allowed the encroachments of the colonists to hurry him into the bloody contest known as King Philip's war.

Massassauga, *mās-a-sā'ga*, the ground rattlesnake of the central United States. See **RATTLESNAKE**.

Masséna, André, *ān-drā mā-sā-nā*, marshal of France: b. Leven near Nice, France, 6 May 1758; d. 4 April 1817. In 1775 he entered the French army and after 14 years' service left the army and returned to Nice, where he married. During the Revolution he entered a battalion of volunteers, and in 1793 was made general of brigade. In 1794 he took command of the right wing of the French army in Italy, where, at Rivoli and elsewhere, he highly distinguished himself. In 1799 he defeated the Austrian and Russian forces at Zürich, and in 1800, by his defense of Genoa for three months, gave Bonaparte time to strike successfully at Marengo. In 1804 he was created marshal of the empire. In 1805 he received the chief command in Italy, where after the Peace of Presburg he occupied the kingdom of Naples. In 1807 he was given the command of the right wing of the French army in Poland, and soon after received the title of Duke of Rivoli. In 1809 he distinguished himself against the Austrians, and at Esslingen his constancy and firmness saved the French army from total destruction. Napoleon rewarded him with the dignity of Prince of Esslingen. In 1810 he took command of the army in Portugal, and forced Wellington within the lines of Torres Vedras, till want of provisions compelled Masséna to retire. In 1814 he was made a peer by Louis XVIII., and though on the return of the emperor he acknowledged his authority, took no active part in the events of the Hundred Days.

Massena, *mā-sē'na*, N. Y., village, in Saint Lawrence County; on the Grasse River, and on the New York C. & H. R. and the Grand T. R.R.'s; about 35 miles northeast of Ogdensburg. It was settled by people from Vermont, about 1802, and was incorporated as a village in 1886. It is situated in a rich agricultural region, in which the chief products are hay, potatoes, dairy products, and apples. Massena Springs, just outside the village limits, is one

with the village in commercial and industrial interests, and is a famous resort on account of its medicinal springs. Great opportunities for manufacturing are afforded by the plant of the Saint Lawrence River Power Company, which has a capacity of 40,000 horse-power, and which can easily be increased. This power has been secured by diverting a small portion of the waters of the Saint Lawrence River through a canal, three miles long, into turbines, which have direct connection with electric generators, and thence into the Grasse River.

The canal starts at the head of the Long Sault rapids in the Saint Lawrence, and is 200 feet wide and 18 feet in depth. Owing to the peculiar formation of the country here, the point at the head of the rapids is 45 feet higher than the point where the canal enters the Grasse River, which is a tributary of the Saint Lawrence. The Grasse acts as a tail race, carrying the water back into the Saint Lawrence. Two bridges span the canal. By using the Grasse River and the canal there is now a passage wholly within the United States for steamers around the unnavigable rapids. The power plant at Massena is second only to Niagara as a centralized power supply station. The chief industrial establishments are reduction works, which employ 300 men; veneering works, employing 100; mineral filler works, 30 employees; sash and door works, 20 employees. Other manufacturing are under consideration. There are seven churches, two banks, a high school, and public schools. Massena is the business centre for a population of 60,000. Pop. (1890) 1,049; (1900) 2,032; (1903) 3,000.

Massenet, Jules Frédéric Emile, *zhül frā-dā-rēk ā-mēl mās-nā*, French composer: b. Montaud, near St. Etienne, France, 12 May 1842. He studied at the Paris Conservatoire, in which in 1878 he became professor of composition. His first important work was the opera 'Don César de Bazan' (1872), which was followed by 'Les Erinnyes' (1873); an oratorio 'Marie Madeleine' (1873); and an oratorio 'Eve' produced in 1875. Later works of his are: The opera 'Le Roi de Lahore'; the cantata 'Narcisse'; 'La Vierge' (1879); 'Hérodiade,' a religious opera (1881); 'Manon Lescaut,' an opera (1884); 'Le Cid' (1885); 'Esclarmonde' (1889); 'Werther' (1892); 'Thaïs' (1894); 'Sappho.' Massenet's earlier works, such as 'Marie Madeleine,' are still among his best. The promise contained in them has not been fulfilled in his later productions, in many of which genuine musical feeling is sacrificed to the tricks that secure popularity.

Massey, *mas'ē*, Gerald, English poet: b. near Tring, Hertfordshire, 29 May 1828. He received but little education, and at 8 was employed in a silk factory. Going to London about 1843, he worked as an errand boy, and six years later became editor of 'The Spirit of Freedom,' a Radical paper, becoming at the same time associated with Kingsley, Maurice, and other Christian Socialists. In 1854 he published 'Ballad of Babe Christabel,' and other poems. The volume attracted the notice of Landor, and the poems issued in succession to it met with no little popularity. Other books of his are: 'The Secret Drama of Shakspeare's Sonnets' (1864-72); 'A Tale of Eternity and other Poems' (1869); 'Concerning Spiritual-

ism' (1872); 'A Book of the Beginnings' (1882); 'The Natural Genesis' (1883); 'My Lyrical Life,' a collection of poems (1889). For some years he lectured at home and in the United States and Australia on spiritualism and various social and socialistic subjects.

Massillon, Jean Baptiste, zhôn ba-těst mäsë-yôn, French preacher: b. Hyères, Provence, 24 June 1663; d. Clermont 18 Sept. 1742. In 1681 he entered the Congregation of the Oratory; then taught theology at Montbrison and Vienne; went to Paris in 1696 as director of the Seminary of St. Malo; and won great favor, even at court, by his eloquent and searching sermons. His funeral orations are particularly famous. In 1718 he was appointed preacher to Louis XV., then only 9 years old, and for him composed the 'Petite Carême,' a notable series of sermons. Massillon was elected to the French Academy in 1719; in the same year he retired from Paris to Clermont, where he died of apoplexy. His works were edited in 1886 by Blampignon, whose biographical sketch, 'Massillon d'après des Documents inédits' (1879), should be consulted.

Massillon, mäs'il-ôn, Ohio, city, in Stark County; on the Tuscarawas River, the Ohio Canal, and on the Wheeling & L. E., the Pennsylvania, and the Cleveland, L. & W. R.R.s; about 100 miles in direct line northeast of Columbus and 8 miles west of Canton. Massillon was established in 1825, and in 1853 was incorporated as a village; the city charter was granted in 1868.

It is situated in the Tuscarawas Valley, noted for its large bituminous coal fields and for its excellent farm lands. In the vicinity of the city are quarries of white sandstone. Some of the industrial establishments are foundries, rolling-mills, machine-shops, bridge works, potteries, glass-works, steel tubing, furnaces, flour-mills, and creameries. In addition to the manufactures of the city there is a large trade in coal, sandstone, grain, and live-stock. The State Hospital and Asylum for the Insane is in Massillon. The city has a number of fine buildings, chief among them are the churches and schools. The government is administered under the charter of 1868, its first charter, and is vested in a mayor, who holds office two years, and a council. The board of education is chosen by popular vote; the boards of health and equalization are elected by the council. Other administrative officials are appointed by the board subject to the approval of the council. Pop. (1890) 10,092; (1900) 11,944.

Massinger, mäs'in-jër, Philip, English dramatist: b. Salisbury 1583; d. Southwark, London, March 1640. He studied at St. Alban Hall, Oxford, went to London in 1606, and soon became a well-known playwright. He collaborated with Nathaniel Field, Thomas Dekker, Cyril Tourneur, and Robert Daborne, and regularly with Fletcher in 1613-25. Independently, he wrote 15 plays, including comedies, tragedies, and tragi-comedies. They are frequently based closely on Italian and Spanish originals, but show much skillfulness in the development of plot, and a knowledge of the requirements imposed by stage presentation. 'Henry VIII.' in its present form was probably written by him with Fletcher. Among the plays wholly by him are: 'The Bondman'

(1624); 'The Roman Actor' (1629); 'A New Way to Pay Old Debts' (1632); 'The Guardian' (1655). 'A New Way to Pay Old Debts' kept the stage in England to the end of the 19th century. There is an edition of his plays by Cunningham (1867); and of 'Selections' by Symon (1887-9). Consult Fleay, 'Biographical History of the English Drama.'

Masson, mäs'on, David, Scottish critic and biographer: b. Aberdeen 2 Dec. 1822. He was educated at Marischal College there and Edinburgh University, and was in 1852 appointed to succeed Clough in the chair of English language and literature at University College, London. He was editor of 'Macmillan's Magazine' 1859-68, and was professor of rhetoric and English literature in the University of Edinburgh 1865-95. He is best known for his elaborate and comprehensive study of Milton's life and times (six volumes, 1858-80)—a work valuable alike as a contribution to English history and to the history of English literature. Other works by him are: 'British Novelists and their Styles' (1859); 'Recent British Philosophy' (1865); 'Drummond of Hawthornden' (1873); 'The Three Devils—Luther's, Milton's, and Goethe's' (1874). He has also published the Cambridge edition of Milton's Poems with introductions, notes, and an essay on Milton's English (1877); 'De Quincey' in 'English Men of Letters' series (1878); an edition of De Quincey's works (14 vols. 1889-91); and 'Edinburgh Sketches and Memories' (1892). In 1893 he was appointed Historiographer-Royal for Scotland.

Masson, Frédéric, frâ-dâ-rêk mäsôn, French historian: b. 1847. He was librarian in the archives of the foreign office, and after the overthrow of the Empire became secretary to Prince Napoleon, and was entrusted with the arrangement of the Prince's papers and collections. He is known as the author of nearly 20 volumes in a still incomplete series of works on Napoleon I. His method is anecdotic, and he has based his statements on original documents, — correspondence, account- and note-books, and the like, many of which he himself owns in his large collection of Napoleonic material. Among the titles of his studies are: 'Napoleon at Home'; 'Napoleon in Campaign'; 'War Adventures'; 'Napoleon's Cavaliers.' In 1903 he was elected to the Académie Française to succeed Gaston Paris.

Mas'sorah, mäs-sō'râ. See MASORA.

Massowah, mäs-sow'ä, or **Massawa**, north-east Africa, a seaport and the principal town of the Italian colony of Eritrea, on a small coral island in the Red Sea, at the northern end of Arkeeko Bay, connected with the mainland by a causeway. The town is built of stone, is defended by several forts, and is supplied with water from the neighboring M'Kulu heights. The town is hot and unhealthy, but the M'Kulu hills have a much better climate. A railway 17 miles long connects with Saati inland. The chief imports are grain and flour, cotton manufactures, glass-ware, arms, cutlery, spices, wines, and spirits; principal exports, rhinoceros-horns, gold, ivory, honey, pearls, gums, skins, and wax, brought by caravans from the interior. Formerly dependent on Egypt, the town and strip of coast were ceded to Italy in

1885. Pop. (1899) 7,775, including 600 Europeans and 480 Asiatics.

Massys, mäs-sis'. See MATSYS, QUENTIN.

Mas'taba, an Arabic word meaning bench, applied to certain Egyptian tombs which were common under the Memphite dynasties. Remains of hundreds of these tombs still exist. They are in size from 18 by 26 feet to 85 by 172 feet. They are oblong, bench-like structures, with flat roofs of stone slabs.

Master and Servant. See LAW OF FAMILY.

Master of Arts (M.A. or A.M., *artium magister*), an academical honor conferred by universities of the United States, Great Britain and other countries, upon students after a course of study and a previous examination in the chief branches of a liberal education, particularly philosophy, philology, mathematics, physics, and history. The word *magister*, connected with a qualifying phrase, was used among the Romans as a title of honor; but its present meaning must be traced to the time of the establishment of the oldest universities. Regularly organized faculties were not then known as they now exist in the universities. The whole circle of academic activity was limited to the seven liberal arts (see ART); and they who received public honors on the completion of their course of studies, for their diligence and knowledge, and had already received the degree of *baccalaureus* (bachelor), were called *magistri artium* (masters of the liberal arts). In American and English universities this degree follows that of Bachelor. The degree of Master of Arts is inferior to that of Doctor of Letters (D. Litt.). In the German universities the title was formerly conferred, but has been superseded by that of Doctor of Philosophy (Ph.D.), which practically corresponds to the degree of M.A. in other universities. This title is an indispensable preliminary to the attainment of the position of *docent* in the German universities, that is, one who has obtained the right to deliver academical lectures.

Master of Ballantrae, bäl-an-trä', **The**, a novel by Robert Louis Stevenson, published in 1889. It is a Scottish romance of the 18th century, beginning with the Stuart uprising of 1745. It is a sombre tragedy of the enmity of two brothers, of whom the elder, James Durrie the Master, takes the side of the Stuarts, the younger, Henry, that of King George.

Master Singers. See MEISTERSINGERS.

Mas'terwort, the rustic name of several umbelliferous plants, as those of the genus *Anethum* (see DILL), formerly much cultivated as pot-herbs, and held in great repute as a stomachic, sudorific, diuretic, etc. The edible root has a pungent taste, causes a flow of saliva and a sensation of warmth in the mouth, and often affords relief in toothache.

Mas'tic Gum, or **Mastiche**, a resinous substance flowing from deep incisions made in the branches of the *Pistachia lentiscus*, a shrub of the terebinth family growing in the countries bordering on the eastern Mediterranean. This tree attains the height of 15 or 20 feet; the leaves are alternate and pinnate; the flowers are small, inconspicuous, disposed in axillary racemes, and are succeeded by an ovoid drupe containing an osseous nut. It forms one of the most important products of Scio, and other

Ægean islands, where it has been cultivated from remote antiquity. Heat seems to exercise a great influence on the resinous product. Mastic is consumed as a chewing-gum in vast quantities throughout the Turkish empire by women of all classes, for the purpose of cleansing the teeth and imparting an agreeable odor to the breath. It is related to myrrh, frankincense, etc., and was formerly in repute as a medicine throughout Europe, but at the present time is chiefly useful in the arts as a varnish for maps, drawings, etc.

Mastication, or **Chewing**, the thorough subdivision of food in the mouth so that it can be readily acted upon by the gastric juice and other digestive secretions. It is the first step in the process of digestion, and is effected by the joint action of the teeth, jaws, tongue, cheeks, and lips. The three last named push the food material between the teeth, and by the lateral and up-and-down motions of the lower jaw it is cut and torn by the incisor, canine, and bicuspid teeth and bruised by the molar or grinding teeth. In the act of mastication the temporal and masseter muscles close the mouth, the mylohyoid and digastric open it, and the pterygoids produce the lateral movement of the lower jaw. These muscles operate by means of the inferior maxillary branches of the fifth pair of nerves. At the same time with the actions above described the food is softened by the saliva (insalivation), which exudes abundantly from the salivary glands by the act of mastication. Typical mastication is seen only in the higher vertebra. "The amphibian bolts its fly, the bird its grain, and the fish its brother without the ceremony of chewing," but in man and the higher animals mastication is necessary for complete and comfortable digestion. The chemist, to dissolve a substance quickly and thoroughly, first pulverizes it in a mortar. Thorough comminution of food by mastication is analogous to the pulverizing process employed by the chemist, but associated with mastication is insalivation, as it is almost impossible to swallow substances which are very dry. Imperfect mastication of food, either by reason of rapid swallowing (bolting), or because of the absence of sound and serviceable teeth, is very frequently the cause of the numerous ailments classified under the term indigestion. Digestion in the stomach and small intestine is made difficult and more or less painful.

Mas'tiff, a breed of dogs of great size, recognized by the large head, the dependent lips, the broad, hanging ears, and by the general muscularity of the form. The mastiff in general disposition is affectionate and gentle, extremely faithful and vigilant. In Rome and in classical ages these dogs were held in high estimation for their strength and courage. The most valued breeds were obtained from Great Britain, where these dogs originated, and were used to guard flocks and herds; and watching has become instinctive with them. Roman officers were appointed to breed them and to transmit them periodically to Rome, where they fought lions, etc., in the arenas of the Roman amphitheatres and were otherwise favorites. The dog now is highly valued, both as a watchdog, and as a domestic companion. Fawn is the prevalent color, and the weight should be about 165 pounds.

MASTIGOPHORA — MATANZAS

Mastigoph'ora, a class of Protozoa "in which the flagellate form is prominent although the amœboid and encysted conditions frequently occur." Typical forms are contained in the order *Flagellata* (q.v.).

Mas'todon, a genus of fossil proboscideans of the elephant family, whose remains are found in all parts of the world in Tertiary formations from Miocene time onward to the dawn of the present era. Although in size and external appearance the larger mastodons much resembled modern elephants, save that, like the mammoths, the northern species were probably clothed with long hair, they differed widely from other genera of the family in details of structure, especially those affecting dentition. Thus milk-molars were present, and sometimes were persistent; and in their structure the fossil molar teeth are not penetrated by deep partitions of cement, and their crowns are marked by few (3 to 5) transverse ridges, which are often broken into nipple-like protuberances. This is, in short, the simplest form of tooth-structure in the family, of which the mastodons are the oldest and most primitive type, and nearest to the earlier *Dinotheria*. The tusks curved upward in growth, sometimes completing a circle. Their length in *Mastodon americanus*, whose remains have been obtained nearly entire from bog-deposits in various parts of the United States, was about 9 feet, indicating, as do the measurements of the skeleton, an animal about equal in average height to the modern Indian elephant, but with a rather more bulky body and a flatter forehead. Of this species several good skeletons are preserved in the museums of the United States and Canada, and certain European species are also well known. About 30 different kinds of mastodons have been described from bones found in almost every country in the world. What brought this widespread group to an end is not clear. There was no diminution in their food, which consisted of herbage, bark and leaves, as is known from undigested stomach-contents found within the skeletons; and they survived the historic vicissitudes of climates until subsequently the present settled conditions arrived. There is good reason to believe that they lasted in America, at least, until after the advent of mankind, but indisputable evidence of this is lacking.

Consult: Woodward, 'Vertebrate Palæontology' (1898); Lucas, 'Animals before Man in North America' (1902); 'American Naturalist,' Vol. XVI., pp. 75, 277 (1882).

Matabeleland, mā-tā-bā'lē-land, South Africa, the southeastern district of Rhodesia (q.v.) between the Limpopo and Zambesi, north of the Transvaal. In 1889 it came under the administration of the British South Africa Company, against whom the natives unsuccessfully rebelled in 1893 and in 1896. The Matabili are a war-like Kafir race, who migrated from Natal in 1827 under their chief Umsilikatse. The country is traversed by ranges of hills,—the Matopopo Hills being the chief—is watered by numerous streams, has good pasture, and is believed to be rich in gold. It is now being rapidly settled and developed. Bulawayo is the capital.

Matachin, măt a chēn', or **Matachine**, "the dance of fools," a former well-known comic

dance performed by maskers in mock-military guise. It was common in France and Italy. The dance itself was merely a display of tumbling or acrobatic feats.

Matador, in Spanish bullfights the man appointed to administer the fatal stroke to the bull. See BULL-FIGHT.

Matagalpa, mā-tā-gāl'pā, Nicaragua, town, capital of the department of Matagalpa, north of the central part of Nicaragua. It is situated in a fertile agricultural region, in which the chief products are tobacco, coffee, and sugar. The lack of railroads has been a hindrance to the growth of the town; but plans are formed for connecting it with the Pacific and with Namagua, the capital, and other cities. The inhabitants are mostly Indians. Pop. (1903) about 11,000.

Matamat'a, a large fresh-water turtle (*Chelys fimbriata*) of the Amazon and Orinoco valleys, which has a flat, weak, but heavily embossed shell, and lies in concealment among the weeds. Its neck is very long, the head is small, the nose is extended into a flat tubular proboscis, and the jaws are so weak and soft that it is evident nothing can be forcibly seized with them. Hence it is believed that the frogs, small fishes and the like, upon which this turtle feeds, are sucked into the throat rather than bitten. To facilitate its concealment against both enemies and expected prey, the head and neck of this remarkable creature are covered with an outgrowth of fleshy fringes, which float about in the water, like tangled weeds, hiding its identity most effectively. Consult Gadow, 'Amphibia and Reptiles' (1901).

Matamoros, Mariano, mā-rē-ā'nō mā-tā-mō'rōs, Mexican patriot: b. Mexico about 1770; d. Valladolid 3 Feb. 1814. He first appears in 1810 as substitute priest of the parish in Jantetelco, a village south of Mexico city. In 1811 he identified himself with the revolt of Hidalgo (q.v.), and became the principal commander under Morelos (q.v.). He attained the rank of lieutenant-general on 19 April 1813. On 14 Oct. 1813 he gained the victory of San Agustín del Palmer, and on 5 Jan. 1814 was captured at the defeat of Purwaran. He was executed in Valladolid market-place.

Matamoros, Mexico, a frontier town and river port opposite Brownsville, Texas, on the right bank of the Río Grande del Norte, about 30 miles above its mouth in the Gulf of Mexico. It consists chiefly of brick houses; around the public square stand the church, town-house, custom-house, and a number of elegant private dwellings. A considerable trade is carried on with the United States; horses, hides, wool, etc., are exported, and manufactured goods imported. During the Mexican War in 1846 the town was occupied by American troops under General Taylor. Pop. (1894) 7,312.

Matanzas, mā-tān'zas (Sp. mā-tān'thās), Cuba, a seaport city on the north coast, capital of Matanzas Province, 52 miles by rail east of Havana. It is situated on Matanzas Bay, one of the largest, safest, and most convenient harbors of the Western hemisphere. The city is well-built with wide, regular, and paved streets, handsome plazas, and public buildings, and good railway communications. The caves of Bel-lamar, and Yumuri Valley, in the neighborhood,

MATAPAN — MATCH INDUSTRY

are two popular natural resorts. Matanzas ranks in importance next to Havana in the export of sugar, molasses, and coffee, the exports of sugar alone averaging annually about \$15,000,000. The city was bombarded by the United States warships during the Spanish-American War in 1898, the only casualty, widely telegraphed, being an injury to a "Matanzas mule," which made the animal famous. Pop. (1899) 36,374.

Matapan, mā-tā-pān', Cape. See CAPE MATAPAN.

Match Industry. It was nearly 800 years after the discovery of phosphorus by an Arab, named Bechel, that it was found possible to obtain a light in a short time by the friction of phosphorus and sulphur. This discovery was made and first applied commercially in the latter part of the 17th century by Godfrey Haukwitz, of London, and, although the feasibility of producing a substance which, with a little rubbing, would, ignite, was at once demonstrated, and, although it was proven that such a substance would be of immense commercial value, yet it was nearly a century and a quarter before a friction match was invented and successfully put on the market. The method employed by Haukwitz consisted of rubbing small particles of phosphorus between folds of brown paper and the flame produced lighted a sulphur match, but, as the phosphorus at that time was costly and considered dangerous, the match was not a success.

Among the earliest inventions was the "phosphorus bottle," containing a piece of phosphorus, stirred about by a hot wire, in order to coat the bottle with oxide of phosphorus, and when a light was desired a sulphur match was thrust into the bottle and thus ignited. This "phosphorus bottle" was followed in 1805 by the "oxymuriate match," the invention of Chancel, of Paris. These matches were, however, considered dangerous, and in 1809 a mixture of phosphorus and magnesia was invented by Derépos, which was designed to do away with the danger attendant upon the use of the others.

One of the first forms of matches used was the brimstone match, and this consisted of strips of resinous or very dry pine wood dipped in melted sulphur and lighted by means of a spark dropped from a flint and steel. This brimstone match was in almost universal use, despite the fact of later inventions, till the first part of the 19th century, and even as late as 1825, but with the general awakening at that time in all branches of industry the same progress was manifest in the invention of matches and of more ingenious machinery for making them. The first invention along this line came in shape of the "Instantaneous-Light Boxes," called the Eupyrions and Prometheans, the invention of a Mr. Jones of London. These light boxes retailed at a very high price and were made of small sticks of dry wood tipped with a mixture of chlorate of potash and sulphur, which, when dipped into sulphuric acid, ignited. These were dangerous because of the acid and because of the liability of harm from the explosion when ignited, beside which the cost was prohibitive to general use. This was followed in 1827 by the Congreve match, invented by a chemist, named Walker, of Stockton-on-Tees. This match was similar to the "Instantaneous-Light Box," but the mixture on the end consisted of gum, chlorate of potash, and sulphide of antimony, placed over a coat of sulphur. They were drawn be-

tween a fold of sandpaper to ignite them. These sold for a shilling per box, containing 84 matches. They did not become generally used because they did not readily ignite and the fumes created by the burning substances were very offensive.

In 1833 the lucifer friction match was put on the market and this differed materially from the "Instantaneous-Light Box," at first being tipped substantially the same as the Congreve, but later having phosphorus as one of the ingredients of the mixture. The manufacture of these phosphorus matches was commenced on a large scale in 1833 at Vienna, by an Austrian named Treschel, and gradually several factories began to produce matches of various kinds, Austria and Southern Germany taking the lead in production. Red or amorphous phosphorus was discovered by Prof. Anton von Schrötter, a German, in 1845, and was used as early as 1855 by Lundstrom, of Jönköping, the first manufacturer of the well-known "safety-match." In these matches the phosphorus is omitted from the composition placed on the tip of the match, but is placed on the side of the box, and thus the match will only ignite when rubbed on the box. On 24 Oct. 1836, Alonzo D. Phillips, of Springfield, Mass., was granted the first patent on friction matches given in the United States.

In the early days the greater portion of the matches made came from the poorer sections of London and various other large cities, and of course were made for the greater part in cellars and badly ventilated places. This often led to disease called necrosis of the bone, caused by the handling of phosphorus, or by inhaling its fumes. This disease in time became so prevalent among the match-makers that, for fear it would be carried along and spread by the manufactured article itself, the local governments took a hand in the matter and forced the owners of these "cellars" to provide well-aired, ventilated and well-lighted places for the employees. With the improvement in surroundings also came improvements in the methods of manufacture. Until about 1842 the splints or sticks of wood used were whittled out by hand entirely, but in that year a machine for cutting these splints was invented by Reuben Partridge, and this practically revolutionized the trade by reducing the number of employees, producing a much better article in a shorter time and materially reducing the cost of manufacture. This will be seen to be true when it is stated that in the year 1856 there were but 40,000,000 matches made in England, while at the present time one factory alone in this country has facilities for making 100,000,000 matches per day.

The general size of the match now made is from 1½ to 2½ inches in length, the wood used being pine, thoroughly dried. After having the knots and cross-grained parts cut out of the blocks of pine, those blocks are placed into the automatic feeder of a machine and then run through and cut into splints. These splints are cut by knives or dies so arranged that when cut they are separated about a quarter of an inch and are then set into cast-iron plates made into an endless chain by link attachments. The speed of this machine may be set according to the needs, from 175 to 250 revolutions per minute, and as it cuts 44 matches at each revolution it may easily be seen the rapidity with which matches are now made. After the splints have

MATE — MATERIA MEDICA

been cut the endless chain attachment carries them from the cutting end of the machine over a block which heats the heads to a temperature great enough to melt paraffine. After they have passed over the heating block the chain carries them along to the receptacle containing the paraffine and composition forming the head. The reason why the match is heated before reaching these composition rollers is that the paraffine may not be chilled by coming into contact with a cold substance and also the match takes more readily to the composition when heated. Having passed the composition rollers and received its head, the match is cooled off by blasts of cold dry air for an hour and a half and then pushed off the iron plates or endless chain by a mechanical device into small paper or strawboard boxes. These boxes, containing 65 to 500 matches, are automatically fed into the machine and, after having received their quota of matches, are placed on a rotary table, covered and packed into cases. The greater portion of the material used for the composition placed on the head of the match is imported from foreign countries, due probably to the fact that the articles may be more cheaply produced in foreign countries owing to the cheapness of labor.

With the advances made in the methods of manufacturing matches, of necessity the machinery for making the boxes made a corresponding advance, and has practically kept astride of the times. The majority of the inventions made in the strawboard box machinery were made by Mr. E. B. Beecher, of Westville, Conn. While the improvement of the match-making machinery is mainly due to McClintock Young, of Frederick, Md.; J. P. Wright, of New Haven, Conn.; Charles Palmer, John W. Denmead, and Joseph Baughman, of Akron, Ohio. The operation of the machinery for making the paper and strawboard boxes used in the match business is as follows: After having placed a roll of strawboard, cut to the proper width and lined either with pink or white paper, in the machine, the board is scored for the corners; it is then glued by an automatic device, folded into an endless tube and passed on through the printing presses in that form and are printed on three sides. After being cut into proper sizes, the boxes are passed further along by the machine to a compartment where they receive a coat of sand on the fourth side, thus making a striking or rubbing surface for the ignition of the match. Thus the cover is completed and the box proper is made in substantially the same way, with the exception of the printing and sanding, and the entire box is turned out from the machine at the rate of over 400 per minute.

The immense saving accruing from these improved devices has steadily reduced the cost of manufacture, and the rapidity with which the entire operation of match-making is conducted has tended to reduce the number of companies operating factories, and also to greatly reduce the number of people employed in the industry.

The effect of the automatic boxmakers on the number of people employed has been wonderful. To have constructed the 2,000,000 boxes, now made in a single day, 25 years ago, would have taken the combined labor of 1,500 persons, whereas it now takes but 75 people to operate the machines which turn out the same work in a more satisfactory manner. In the number of establishments making matches the effect of the

modern machinery has made itself apparent also. Whereas in 1880 there were in the United States 37 companies engaged in the manufacture of matches, employing over 2,200 persons and turning out a product of about 2,200,000 gross per annum, valued at \$4,668,446, in 1900 there were only 22 factories, employing 2,047 people, and though the prices had been reduced from 50 to 75 per cent., the product was valued at over \$6,000,000.

The statistics of the industry for the last three decades are as follows:

	1880	1890	1900
Number of establishments	37	27	22
Capital	\$2,714,850	\$1,941,092	\$3,893,000
Salaried officers, clerks, etc.		39	66
Salaries		\$70,655	\$87,115
Wage earners	2,219	1,666	2,047
Wages	\$535,911	\$473,556	\$612,715
Miscellaneous expenses ..		\$124,800	\$463,045
Cost of materials used ..	\$3,298,562	\$335,008	\$3,420,740
Value of product	\$4,668,446	\$2,193,638	\$6,005,937

The match-making industry has assumed enormous proportions in Norway, Sweden, Germany, France, and the United States, in France the industry being a government monopoly, in the United States being practically controlled by one corporation.

Mate, an officer in the mercantile marine who acts as the assistant of the captain or master. There are four grades—first, second, third, and fourth mate. The junior mate has usually the superintendence of the stowing of the vessel. The law recognizes only two classes of persons in charge of a trading vessel—the master and the mariners, the mates being included in the latter. In the navy, the term mate is now limited to the assistants of certain warrant officers, as boatswain's mate, gunner's mate, etc.

Matehuala, mā-tā-wā'lā, Mexico, a southern town of the state of Nuevo León, with silver-melting establishments and important silver mines in the vicinity. Pop. (1895) 8,300.

Materia Medica (Lat. "medical matter"), that division or branch of medical science which treats of drugs, their origin, classification as natural products, preparation, purification, action on the animal economy, together with the mode of administering them for the relief and cure of disease. The action of the various agents in the materia medica upon the human family has been ascertained by experience, sometimes by experiment, especially by administering various drugs to some of the lower order of animals such as dogs, cats, rabbits, guinea pigs, rats and mice. Perhaps the best general classification of medicines, is as stimulants, sedatives, narcotics, emetics, alteratives, tonics, anæsthetics, antispasmodics, astringents, spinants, cathartics, diaphoretics, diuretics, blennorrhætics, emmenagogues, hæmætinics, antacids, irritants, demulcents, coloring agents, and anthelmintics. This classification is based upon the direct effect of the different drugs upon the tissues of the human economy under the various headings which drugs may be conveniently grouped under four general sections, namely: 1. Those which have a special action on the brain, spinal cord and

MATERIALISM

the general nervous system. 2. Those which have a special action on the secretions. 3. Those which change the blood. 4. Those which act locally, when applied to the surface of the body. Section (1) includes antispasmodics, anesthetics, astringents, narcotics, tonics, sedatives, spinctants, and stimulants. Section (2) includes the emetics, emmenagogues, blennorrhetics, diuretics, diaphoretics, and cathartics. Section (3) includes alteratives, antacids, and hæmatinics. Section (4) includes anthelmintics, coloring agents, demulcents, and irritants. See THERAPEUTICS; PHARMACOPEIA.

Materialism, the philosophical theory that everything which exists is ultimately material in nature, or that whatever is real can be derived and explained in accordance with the laws of material phenomena. This, of course, carries with it a denial of the reality of any finite or infinite spirit as an immaterial substance, and a repudiation of all forms of idealism, which uses thought or intelligence as a principle of explanation. Materialism, however, may be more or less explicit, and may maintain either absolutely, or with various modifications, the primary and all-embracing character of matter. Thorough-going materialism asserts that nothing exists but physical bodies and physical processes. What are called immaterial substances and processes it either declares to be unreal, or explains away as ultimately not different in nature from physical substances and processes. Moreover, for materialism of this consistent and uncompromising type, matter is dead and moved only by mechanical forces. It has no "psychic side," and the laws which it obeys are the expressions of a blind physical necessity. This extreme view is perhaps no longer maintained by any philosophical thinker of reputation, but in various modified forms it still exists as a tendency to subordinate mental phenomena to physical processes. The more important of these modifications and limitations may be brought under the following heads. (1) The subordination of mental phenomena, while still acknowledging more or less explicitly their distinctive character, to physical, and especially to physiological processes as their determining causes. This position does not avoid any of the practical consequences of materialism, and always tends, when thought out, to revert to the strict ontological form of the theory. For it is clear that if physical processes are able to cause mental modifications, the mind cannot be regarded as fundamentally different in character from the matter which affects it. (2) The view that matter is not a dead lump or mass that moves only when acted upon by some external body, as the older theories assumed, but that every particle of matter—every atom, or it may be every cell—is "conjoined with a soul," or has a "psychical side," or "contains a certain element of mind-stuff." By thus introducing an element which is different in character and in mode of operation from matter, this theory seems to differentiate itself in principle from materialism. Nevertheless, it is usually assumed tacitly by representatives of this modern Hylozoism (q.v.) that within the atom or cell the material side is the primary and determining element, while the psychical is secondary and subordinate. Moreover, the whole mode of conception usually remains at the mechanical

stage, since the immaterial element never comes to its rights as an ideal principle, but is conceived as a mere moving force or instinct, and also since it is assumed that the complex mental life can be built up by the composition of psychic elements just as a material body is constituted by the combination of its parts. (3) The position of energism. Recently an attempt has been made to find in energy an ultimate reality in terms of which both mental and material phenomena may be expressed. It cannot be maintained, however, that the conception of energy has yet been clearly defined, nor is everyone prepared to accept the assurance of Prof. Ostwald, the chief representative of the theory, that energy is the concrete reality which we directly experience. To many it may appear to be merely an abstract conception to which no reality can correspond. Apart from this difficulty, however, energism does not avoid materialism merely by dematerializing its fundamental principle. In Prof. Ostwald's hands, it appears to remain essentially materialistic; since the conceptions employed and the laws which the transformations of energy obey are those of physical science.

If the period of the Middle Ages is excepted, when philosophical thought was determined mainly by theological conceptions, materialism may be said to have held a place throughout the whole history of philosophy. We have already noticed some of the forms in which this mode of thought continues to appear at the present day, and may now refer briefly to its more important historical representatives. The systems of the early Greek philosophers who found the fundamental principle of things in some physical substance, such as water, air, or fire, cannot properly be classed as materialism. For as yet there was no opposition between the material and the spiritual. Neither the conception of matter as lifeless and unintelligent substance, nor of mind as an immaterial directing principle, had yet been formed. Atomism (q.v.), as developed by Democritus of Abdera (q.v.), is the first thorough-going system of materialism. Democritus taught that the soul, like everything else, is an aggregate composed of atoms. The soul-atoms differ from all the others in being the finest, smoothest, and most mobile. When they are in isolation, they are insensible, but from their union sensation arises. From sensation all the other processes of the mental life originate. The same conclusions were maintained by the Epicureans (q.v.), who adopted without any essential modification the theory of atomism. In spite of the statement of the Stoics (q.v.) that whatever exists is corporeal, their system cannot properly be described as materialism. For the human soul and God, the all-embracing Logos of which the human reason is a spark or emanation, though constantly described in materialistic terms, yet function ideally as rational directing forces.

Materialism was revived in modern times by Gassendi (1592-1655) (q.v.) under the form of atomism. Modern materialism was, however, first worked out by Thomas Hobbes (q.v.), who based it upon the mechanical conceptions which in his day were being made the basis of all physical science. He did not deny the existence of immaterial things—God, angels, pure spirits—but shrewdly contented

himself with showing that only that which is composed of parts, that is, bodies, can be the object of thought and so be known. All real phenomena must therefore be explained in accordance with the mechanical theory and in terms of the movement of bodies. Under the influence of the developing physical sciences, and especially of the dominant conception of mechanism, materialistic tendencies played an important part in the thought of the 18th century. David Hartley (1704-57) and Joseph Priestley (1733-1804) (qq.v.) definitely subordinated the mental life to the bodily processes, though the latter attempts to reconcile his materialism with Christianity and even to support it by appealing to the Bible. It is in France, however, in the systems of La Mettrie (1709-51), Baron d'Holbach (1723-89), and Cabanis (1757-1808) (qq.v.) that we find in this century representatives of materialism who do not hesitate to draw the most extreme consequences of their doctrine, to deny the existence of God, and to reduce man to a mere piece of physical mechanism. Again, in the middle of the 19th century, a revival of materialism occurred in Germany which had an important popular influence. The most important names connected with this movement are Carl Vogt, J. Moleschott, H. Czolbe, and Louis Büchner (whose book, 'Kraft und Stoff'—'Force and Matter'—has been called the Bible of German materialism, and has passed through numerous editions in its English translation). The general adoption of the evolutionary point of view was in the beginning at least favorable to materialism. The philosophical problem seemed to be to derive from some primitive form of matter all the various modes of existence in accordance with the established laws of physical evolution. To this task Herbert Spencer (q.v.) devoted his life with a result that is variously estimated in different quarters. It can at least be said that at present thinkers are more inclined than formerly to question the adequacy of physical science to furnish a complete and final explanation of the nature of the evolutionary process.

Mathematical Induction. See INDUCTION, MATHEMATICAL.

Mathematical Societies and Journals. The oldest of the sciences, mathematics has always been cultivated and fostered, often with a degree of preferment over the later branches of the tree of knowledge, by the universities, the great academies, and the other scientific bodies of a general scope throughout the civilized world. That indispensable condition for satisfactory progress, facility of publication, has been provided for mathematicians in a very large degree by the 'Transactions' and 'Proceedings' of learned societies representing a wide scientific field. The specialist will usually prefer the mathematical journals proper, which indeed send out in a steady flow the finest product

of the mathematical genius of the age. Theirs is the post of honor; it lies with them, by critical encouragement or repression, to maintain the standard of excellence of a great profession.

But there remains another set of functions, which to-day are more and more efficiently performed by the mathematical societies. These include in their membership nearly every mathematician of standing in the four quarters of the globe. They provide a professional forum for the discussion of mathematical questions and of mathematical interests, and furnish the powerful stimulus of association and solidarity. Their activities cover a wide range, including the presentation and publication of papers and memoirs, the encouragement of bibliographic and encyclopedic undertakings, the organization of international congresses, special conferences and lectures, the exercise of a beneficial advisory influence on the mathematical curricula and equipment of the schools and universities, the diffusion of a better understanding of the science in the educated world, the formation of libraries, collections of models, etc., and the promotion of agreeable social and personal relations among mathematicians.

The following list comprises the principal mathematical societies of the world, arranged in chronological order of foundation, with mention of their several publications:

- 1690. Mathematische Gesellschaft in Hamburg. Mittheilungen, 1881—.
- 1778. Wiskundig Genootschap te Amsterdam. Wiskundige Opgeven mit de Oplossingen, 1855—; Nieuw Archief voor Wiskunde, 1875—; Revue Semestrielle des Publications Mathématiques, 1892—.
- 1866. London Mathematical Society, Proceedings, 1865—.
- 1866. Moscow Mathematical Society, Transactions, 1869—.
- 1873. Société Mathématique de France, Bulletin, 1873—.
- 1883. Mathematical Society of Edinburgh, Proceedings, 1884—.
- 1884. Circolo Matematico di Palermo, Rendiconti, 1884—.
- 1886. Mathematical Society of Charkow, Bulletin, 1879.
- 1888. American Mathematical Society, Bulletin, 1891—; Transactions, 1900—; Mathematical Papers of the Chicago Congress, 1896; Boston Colloquium Lectures on Mathematics, 1905.
- 1890. Deutsche Mathematiker-Vereinigung, Jahresbericht, 1892—.
- 1895. British Mathematical Association, Mathematical Gazette, 1894—.

A history of the Hamburg society, prepared in connection with the celebration in 1890 of its two hundredth anniversary, may be found in Vol. II. of the 'Mittheilungen.'

The 'Wiskundig Genootschap' renders an especially valuable service in the mathematical world by the publication of the 'Revue Semestrielle,' a condensed abstract of all the mathematical papers published in the various journals, constantly brought up to within a few months of the current date. The value to a productive mathematician of this great labor-saving device is quite inestimable.

The first president of the London Mathematical Society was the illustrious De Morgan, and the roll of members has included the names of Cayley, Sylvester, H. J. S. Smith, Clifford, Salmon, Stokes, Kelvin, and most of the other eminent British mathematicians of the time. The secretary's office was efficiently filled for the long period of 34 years (1867-1901) by the late Robert Tucker. The 'Proceedings,' which is the leading British mathematical journal, has re-

MATHEMATICAL SOCIETIES AND JOURNALS

cently been enlarged in size. The membership of the society is about 300.

The Société Mathématique de France has about the same membership. The meetings are held twice a month at the Sorbonne. The president of the society for 1905 is M. Borel, the secretaries are MM. Grévy and Raffy. The council includes Appell, Darboux, Jordan, Picard, and Poincaré. The 'Bulletin' is issued quarterly.

The Deutsche Mathematiker-Vereinigung represents in full measure the fruitfulness and vigor of German mathematics. Its organization had been foreshadowed for many years, but was actually brought about in 1890 by the initiative of members of the mathematical-astronomical section of the older Society of German Natural Scientists and Physicians, in affiliation with which the Vereinigung still continues to hold its annual meetings. The appearance of the 'Jahresbericht,' whose volumes were originally issued in parts of book form, signalized the beginning of a series of invaluable reports on various branches of mathematics, beginning with the celebrated report by W. F. Meyer on 'The Present Status of the Theory of Invariants' (Vol. I., 1892). These reports and other undertakings of a bibliographical, critical, and statistical character ultimately led to the plan of the great 'Encyclopedia of Mathematics,' now in course of publication by Teubner, under the auspices of the academies of science of Munich, Vienna, and Göttingen. The Vereinigung has also played an active part in the organization of the international congresses of mathematicians, notably those at Zürich (1897) and Heidelberg (1904). It has interested itself effectively in the questions concerning the teaching of mathematics in the schools, universities, and technical institutes, the training of teachers, the correlation of instruction in pure and applied mathematics, and other matters of reorganization and progress in education, some of which are phases of an international reform movement. A history of the Vereinigung by the former secretary and present editor of the 'Jahresbericht,' Prof. A. Gutzmer of Jena, was issued on the occasion of the Heidelberg congress. The society has at present about 650 members. Meetings are held annually. It recently received from B. G. Teubner the gift of a complete set of his extensive mathematical publications as the nucleus of a library. The 'Jahresbericht,' now published monthly with occasional double bimonthly numbers, contains, beside the earlier reports mentioned above and a record of the society's activities, addresses, biographies and necrologies, original papers, criticisms, discussions and reviews, and notes on current events. More extensive papers will hereafter be published as separate volumes.

The American Mathematical Society was originally organized as the New York Mathematical Society in 1888 and was reorganized under its present national title in 1894. Sylvester's work at Baltimore (1877-84) and the influence of young mathematicians returning from study in Germany had produced a tidal movement of which the society has since its early days been the forefront and exemplar. Its membership, now about 500, includes practically every mathematician in the United States, and a considerable number of foreign repre-

sentatives. The 'Bulletin,' published since 1891 in monthly numbers, from October to July, is of the type later adopted by the 'Jahresbericht,' but contains also the official reports of the frequent meetings of the society, with abstracts of the papers presented and a complete bibliography of recent mathematical publications. Another special feature of the 'Bulletin' is the extensive 'Notes' on current events in the mathematical world. A general index of the first 13 volumes was issued in 1904. The 'Transactions,' founded in 1900, is the official organ of the society for the publication of the more important papers read before it. Beside the 'Chicago Congress Papers' and the 'Boston Colloquium Lectures on Mathematics,' the publications of the society include the 'Annual Register,' containing, in addition to the list of officers and members and other official data, the catalogue of the library, now including 2,000 bound volumes, which are deposited in the Columbia University Library.

Regular meetings are held four times a year in New York. Officers are elected at the annual meeting in December. A summer meeting is also held each year at some specially chosen place. At intervals of two or three years the summer meetings are reinforced by colloquia, or courses of lectures by specialists on recent advances in their particular lines of work. The rapid growth of mathematical interest in the Central and Western sections of the country have led to the organization of a Chicago Section (1898) and a San Francisco Section (1902), each of which holds two meetings annually.

The presidents of the society have been J. H. Van Amringe, 1888-90; Emory McClintock, 1890-4; G. W. Hill, 1894-6; Simon Newcomb, 1896-8; R. S. Woodward, 1898-1900; E. H. Moore, 1900-2; Thomas S. Fiske, 1902-4; W. F. Osgood, 1904-. The secretaries have been Thomas S. Fiske, 1888-95, and F. N. Cole, 1895-. The business of the society is transacted by a council composed of the officers, ex-presidents, and 12 other members elected for a term of three years. About 150 papers are presented before the society each year.

While the society is more especially devoted to the advancement of the higher branches of mathematics, it exerts a considerable influence both directly and through its members on the teaching of the subject in the schools and universities. The report of a committee of the society on college entrance requirements in mathematics has recently been adopted by the College Entrance Examination Board. A report on the requirements for the master's degree, presented to the Chicago Section, has been favorably recognized by several of the Western universities. The society has also contributed materially to bring about the organization of associations of teachers of mathematics throughout the country, a movement especially stimulated by Prof. Moore's presidential address (1902).

Historical notices of the society may be found in the presidential addresses of Dr. McClintock ('Bulletin,' January 1895) and Prof. Fiske (ibid., February 1905). Other notices are scattered through the secretary's reports. The society, which has doubled in membership in the past 11 years, serves to-day to bring together in a harmonious whole all the mathemat-

MATHEMATICAL SOCIETY—MATHEMATICS

ical activities of America. It is a centre not only of scientific activity but also of professional good feeling and agreeable personal relations.

The British Mathematical Association, formerly known as the Association for the Improvement of Geometrical Teaching, is devoted to improved instruction in elementary mathematics.

The international congresses of mathematicians have been mentioned above. While these are individually but temporary gatherings, they have come to be an established institution of great and permanent value. Their sequence of time and place is: Paris, 1889; Chicago, 1893; Zürich, 1897; Paris, 1900; Heidelberg, 1904; Rome, 1908.

The exchanges of the American Mathematical Society include about 140 journals which regularly publish mathematical papers of appreciable value. In the notices appended to his collection of abbreviated titles of journals ('Jahresbericht der Deutschen Mathematiker-Vereinigung,' Vol. XII, 1903, pp. 426-444) Felix Müller sets the grand total ever published of all journals of a fairly mathematical complexion at about 1,200, of which over 600 now survive. More than 300 journals are cited in the references of the early numbers of the 'Encyclopedia of Mathematics.' The 'Revue Semestrielle' reports the contents of some 250 journals; the 'Fortschritte' list is about 170.

The oldest journals in Müller's list are the 'Philosophical Transactions' and the 'Journal des Savants,' both dating from the year 1665. Following these are the publications of the academies of Paris (1666) and Bologna (1690). From the 18th century there still survive, beside the journals of the academies (Berlin 1700; Petersburg, 1724; Göttingen, 1751; and others), also the 'Memorie di Matematica e di Fisica' (1782) of the Società Italiana, the 'Bulletin' (1789) of the Société Philomatique of Paris, and the 'Journal de l'Ecole Polytechnique' (1794). Among the extinct journals may be mentioned the 'Ladies' Diary' (1704), 'Gentlemen's Diary' (1741), these two uniting in the 'Lady's and Gentlemen's Diary' (1841-71); the 'Cambridge Mathematical Journal' (1839-45), the forerunner of 'Sylvester's Quarterly Journal'; Gergonne's 'Annales de Mathématique' (1810-31); Tortolini's 'Annali' (1850-7), superseded by the present 'Annali di Matematica'; and the various journals (1786-1825) of Hindenburg, Breithaupt, Bessel, Kretschmar. In America the ephemeral existences are chronicled of the 'Mathematical Correspondent' (1804-6), 'Adrain's Analyst' (1808) and 'Mathematical Diary' (1825-32), 'Mathematical Companion' (1828-31), 'Mathematical Miscellany' (1836-9), 'Cambridge Miscellany of Mathematics, Physics, and Astronomy' (1842-3), 'Runkle's Mathematical Monthly' (1858-61). The publication of the 'Analyst' (1874-83) marked a substantial advance. Martin's 'Mathematical Visitor' (1877) and 'Mathematical Magazine' (1882) still cling to existence. The 'Mathematical Magazine' (1882) and 'Mathematical Messenger' (1884) are extinct.

The following list gives the date of foundation, the title, and the present place of publication of the strictly mathematical journals now

in existence and not already cited in connection with the list of mathematical societies above:

- 1826. 'Crelle's Journal' für die rein und angewandte Mathematik,' Berlin.
- 1836. 'Liouville's Journal de Mathématiques pures et appliquées,' Paris.
- 1842. 'Nouvelles Annales de Mathématiques.'
- 1855. 'Quarterly Journal of Pure and Applied Mathematics,' London.
- 1858. 'Annali di Matematica pure ed applicata,' Milan.
- 1863. 'Giornale di Matematiche di Battaglini,' Naples.
- 1868. 'Mathematische Annalen,' Leipzig.
- 1870. 'Bulletin des Sciences Mathématiques,' Paris.
- 1871. 'Jahrbuch über die Fortschritte der Mathematik,' Berlin.
- 1872. 'Messenger of Mathematics,' London.
- 1878. 'American Journal of Mathematics,' Baltimore.
- 1881. 'Mathesis,' Ghent.
- 1881. 'Gazeta Matematica,' Bucharest.
- 1882. 'Acta Mathematica,' Stockholm.
- 1884. 'Annals of Mathematics,' Cambridge, Mass.
- 1886. 'Bibliotheca Mathematica,' Leipzig.
- 1886. 'Periodico di Matematica' (Supplemento 1898), Leghorn.
- 1890. 'Nyt Tidsskrift for Matematik,' Copenhagen.
- 1891. 'Revue de Mathématiques spéciales,' Paris.
- 1894. 'American Mathematical Monthly,' Springfield, Mo.
- 1894. 'L'Intermédiaire des Mathématiciens,' Paris.
- 1896. 'Il Pitagora,' Palermo.
- 1896. 'Revue de Mathématiques,' Turin.
- 1897. 'Wiadomosci Matematyczne,' Warsaw.
- 1898. 'Formulaire Mathématique,' Turin.
- 1898. 'L'Education Mathématique,' Paris.
- 1898. 'Bollettino di Bibliografia e Storia delle Scienze Matematiche,' Turin.
- 1899. 'L'Enseignement Mathématique,' Paris.
- 1900. 'Bollettino di Matematica,' Bologna.
- 1901. 'Rivista trimestrale di Matematica,' Saragossa.

Mathematics. The science of mathematics — what shall it be said to be? A question much discussed by philosophers and mathematicians in the course of more than 2,000 years, and especially with deepened interest and insight in our own times. Many have been the answers, but none has approved itself as final. All of them, by nature belonging to the "literature of knowledge," fall under its law and tend to "perish by supersession." Naturally enough conception of the science has had to grow with the growth of the science itself. For it must not be inferred that mathematics, because it is so old, is dead. Old it is indeed, classic already in Euclid's day, being surpassed in point of antiquity by but one of the fine arts and by none of the "natural" sciences; but it is not only the oldest science, it is also as new as any, living and flourishing to-day as never before, advancing in a thousand directions by leaps and bounds. It is not merely as a giant tree throwing out and aloft myriad branching arms in the upper regions of clearer light and plunging deeper and deeper root in the darker soil beneath. Rather is it an immense forest of such oaks, which, however, literally grow into each other, so that, by the junction and intercrecence of limb with limb and root with root and trunk with trunk, the manifold wood becomes a single living organic growing whole. A vast complex of interpenetrating theories — such the science now actually is, but it is more wondrous still potentially, component theories continuing more and more to grow and multiply beyond all imagination and beyond the compass of any single genius, however gifted. What is this thing so marvelously vital? What does it undertake? What is its

motive? How is it related to other modes and interests of the human spirit?

One of the oldest, at the same time the most familiar, of the definitions conceived mathematics to be the science of magnitude, where magnitude, including multitude as a special kind, signified whatever was "capable of increase and decrease and measurement." Capability of measurement was the essential thing. That was a most natural definition of the science, for magnitude is a singularly fundamental notion, not only inviting but demanding consideration at every stage and turn of life. The necessity of finding out how many and how much was the mother of counting and measurement, and mathematics, first from necessity and then from joy, so busied itself with these things that they came to seem its whole employment. But now the ordinary notion of measurement as the repeated application of a constant finite unit has been so refined and generalized, on the one hand through the creation of the so-called irrational and imaginary numbers (see ALGEBRA and COMPLEX VARIABLE), and on the other by use of a scale, as in non-Euclidean geometry (see NON-EUCLIDEAN GEOMETRY), where the unit appears to suffer lawful change from step to step of its application, that to retain the old words and call mathematics the science of measurement seems quite inept as no longer telling either what the science has actually become or what its spirit is bent upon.

Moreover, the most striking measurements, as of the volume of a planet, the valency of atoms, the velocity of light, or the distance of star from star, are not done by *direct* repeated application of a unit. They are all accomplished by indirection. Perception of this fact it was which led to the famous definition by the philosopher and mathematician, Auguste Comte, that mathematics is the "science of *indirect* measurement." Here doubtless we are in presence of a finer insight and a larger view, but the thought is not yet either wide enough or deep enough.

For it is obvious that there is much admittedly mathematical activity that is not in the least concerned with measurement whether direct or indirect. In projective geometry (which see), for example, it was observed that *metric* considerations were either absent or subordinate. The fact, to take a simplest example, that two points determine a line uniquely, or that the intersection of a sphere and a plane is a circle, is not a metric fact: it is not a fact about size or quantity or magnitude. In this field it was *position* rather than size that to some seemed the center of interest, and so it was proposed to call mathematics the science of magnitude or measurement and position.

Even as thus expanded, the definition yet excludes many a mathematical realm of vast, nay, infinite extent. Consider, for example, that immense class of things known as *operations*. These are limitless alike in number and in kind. Now it so happens that there are systems of operations such that any two operations of a given system, if thought as following one another, together thus produce the same effect as some other single operation of the system. For an illustration, think of all possible straight motions in space. The

operation of going from a point *A* to a point *B*, followed by the operation of going from *B* to a point *C*, is equivalent to the single operation of going from *A* to *C*. Thus the system of such operations is a closed system: combination of any two operations yields a third not without but within the system. Now the theory of such closed systems—called groups (see GROUPS) of operations—is a mathematical theory of colossal proportions. But it is obvious that an abstract operation, though a very real thing is neither a position nor a magnitude.

This way of trying to come at an adequate conception of mathematics, *viz.*, by attempting to characterize in succession its distinct domains, or varieties of content, or modes of activity, is not likely to prove successful. For it demands an exhaustive enumeration, not only of the fields now occupied by the science, but also of those destined to be conquered by it in the future, and such an achievement would require a prevision that none may claim.

Fortunately there are other paths of approach that seem more promising. Every one has observed that mathematics, whatever it may be, possesses a certain mark, namely, a degree of certainty not found elsewhere. So it is, proverbially, the exact science par excellence. Exact, no doubt, but in what sense? To this an excellent answer is found in a definition of the science given about one generation ago by a distinguished American mathematician, Professor Benjamin Peirce: mathematics is the science which draws necessary conclusions—a formulation of like significance with the fine *not* by Professor William Benjamin Smith, to wit: mathematics is the universal art apodictic. These statements, though neither of them may be entirely adequate, are, both of them, telling approximations, at once foreshadowing and neatly summarizing for popular use the conclusion reached by the creators of modern logic (see SYMBOLIC LOGIC), that mathematics is included in, and, in a profound sense, may be said to be identical with, symbolic logic. Observe that the emphasis falls on the quality of being "necessary," or logically *correct*. Naught is said about the conclusions being true. That is another matter, for subsequent consideration.

But why are mathematical conclusions correct? Is it that the mathematician has a reasoning faculty essentially different in kind from that of other men? By no means. What, then, is the secret? Reflect that conclusion implies premises, that premises involve terms, that terms stand for ideas or concepts or notions, and that these latter are the ultimate material with which the spiritual architect, called the reason, designs and builds. Here, then, one may expect to find light. The apodictic quality of mathematical thought, the correctness of its conclusions, are due, not to any special mode of ratiocination, but to the character of the concepts with which it deals. What is that distinctive characteristic? The answer is: precision, sharpness, completeness, of determination. But how comes the mathematician by such completeness? There is no mysterious trick involved: some ideas admit of such precision and completeness of determination, others do not; and the mathematician is one who deals with those that do. Law,

says Blackstone, is a rule of action prescribed by the supreme power of a state commanding what is right and prohibiting what is wrong. But what are a state, and supreme power, and right, and wrong? If all such terms admitted of complete determination as do, for example, such terms as triangle and circle, then the science of law would be a branch of pure mathematics. And such, too, to take another example, would be psychology, were consciousness, mind, perception, imagination, and all kindred terms, as completely determinable as the notion sphere. It will be asked, does not the lawyer sometimes arrive at correct conclusions? It may be admitted that he does sometimes, and so, too, of the psychologist or historian or sociologist. When this happens, however, when these students arrive, it is not meant at truth, for that may be by happy chance or by intuition, but when, strictly speaking, they arrive at conclusions that are correct, at conclusions, *i.e.*, that follow logically from completely ascertained data or premises, then that is because they have been for the time acting in all literalness the part of mathematician. That is not to aggrandize the science of mathematics. Rather is it for credit to all serious thinking that, in any considerable garment of thought, one may find here and there, rarely enough sometimes, a mathetic fiber, woven in some perhaps exceptional moment of precise conception and rigorous reason. To think aright is no characteristic striving of a class of men. It is a common aspiration. Only, as before said, the stuff of thought is mostly intractable, formless, nebulous, like some milky way awaiting analysis into distinct star forms of completely determinate ideas.

The mentioned aspiration and the tendency of all thought, of all science, to assume the character of mathematics admit of many illustrations, which at the same time serve to show clearly the ultimate distinction between that thought which is mathematical and that which is not. One or two such illustrations must suffice.

There is no more common or more important scientific notion than that of function. The term is applied to either of two variable things (including constants conceived as special variables, whose variation is zero in amount) so related that to any value or state of either there corresponds one (or more) value (values) or state (states) of the other. Any two corresponding values or states are said to constitute a pair of values or states, and any two functionally related variables may be called a function-pair. Examples of such function-pairs abound on every hand, as the radius and the area of a circle; the corresponding values of x and y in an equation, $2x - 3y + 5 = 0$; elasticity of medium and velocity of sound or other undulation; the amount of sodium chloride formed and the time occupied; the prosperity of a given community and, *ceteris paribus*, the intelligence of its patriotism. Indeed it may be that there is no thing which is not in some sense a function of every other. Be this as it may, one thing is very certain, namely, a very great part, if not the whole, of our thinking is primarily concerned with functional relationships, deals, that is, immediately or mediately with pairs or systems of corresponding values

or states or changes. Behold, for example, how the parallelistic psychology searches for correlations between psychological and physical phenomena. Witness, too, the sociologist seeking to determine a law of correspondence between the homogeneity of a population and its peacefulness; the anthropologist attempting to find a formula correlating mental power and brain-weight; the physicist's determinations of dependence between pressure and volume of a gas; and so on and so on. It is, then, here, in the immense and wondrously diversified domain of correspondence, the answering of value to value, of change to change, of condition to condition, of state to state, that the knowing activity, the intellect, finds its field.

What is it precisely that we seek to do by means of a correlation? The answer is: when one or more facts are given or known, to pass with absolute certainty to the correlative fact or facts. For example, if $y = \sin x$, then, if a value be assigned to x or y , the corresponding value or values of y or x are determined by the equation, or definition, of the functional correspondence between the assemblage of values which x may take and the assemblage that y may assume. To effect the desired transition from the given or known to the dependent ungiven or unknown, obviously requires one or more formulæ or equations which shall serve to define precisely the manner of correspondence, the law of dependence. Where do such defining formulæ or equations come from? Strictly speaking, they are never found, they are always assumed, assumed immediately or else mediately, that is, in the latter case, derived by assumed logical processes from such as belong to the former case. This statement is valid in every field of logical thought. In every field it is true that from nothing assumed nothing can be derived. Now, nothing is easier than to write down a perfectly definite formula that does not tell how cheerfulness depends on climate or retentiveness on interest or the volume of a cube on its dimensions. The mentioned inapplicability or "inutility" does not, however, at all tend to invalidate the formula regarded as defining a certain law of correlation. Indeed a given formula may be perfectly intelligible in itself; it, alone or joined with others in similar case, may state a perfectly intelligible law of correspondence, which, nevertheless, may have no validity whatever in the physical or in the sensuous universe. What is it, then, that guides in the choice of formulæ? For such determination or choice seems hardly referable to chance alone. The answer is that, broadly speaking, choice is determined by curiosity, and curiosity is itself not determined by choice, but is rather matter of native gift or predilection.

Just here we are in position where we have only to look steadily a little in order to perceive clearly the sharp and ultimate distinction between mathematics, on the one hand, and physical or other science, on the other. These are discriminated according to the kind of curiosity whence they spring. The mathematician is curious about definite abstract relationships, about logically possible modes of order, about varieties of abstract implications, about completely determined or determinable functional relationships considered solely in and of themselves, that is, without

the slightest concern about the question whether or not they have external or sensuous or other sort of validity than that of being logically thinkable. It is the aggregate of logically thinkable relationships that constitutes the mathematician's universe, an indefinitely infinite universe, worlds in worlds of worlds in worlds of wonders, inconceivably richer in mathetic content than can be any outer world of sense. Immense indeed and marvelous is our own world of sense with its rolling seas and stellar fields and undulating ether. But compared, one need not say with the entire world of mathesis, but only with the hyperspaces (see *HYPERSPACE*) explored by the geometrician, the whole vast region of the sensuous universe is literally as a merest point of light in a shining sky.

Now this mere speck of a physical universe, in which the chemist, the physicist, the astronomer, the biologist, the sociologist, and the rest of nature students, find their great fields, may be, as it somewhat seems to be, a realm of invariant uniformities or laws; it may be a mechanically organic aggregate, connected into an ordered whole by a tissue of completely definable functional relationships; and it may not. In other words, it may be that the universe eternally has been and is a genuine cosmos, that the external sea of things immersing us, although it is ever changing infinitely, changes only lawfully, in accordance with a system of immutable laws, constituting an *invariant* (see *INVARIANTS AND COVARIANTS*) at once undervied and indestructible and securing everlasting harmony through and through; and it may not be such. The student of nature assumes, he rightly assumes, that it is, and, moved and sustained by appropriate curiosity, he endeavors to find in the outer world what are the elements and relationships assumed to be valid there. "Natural science," said Bernhard Riemann, "is the attempt to comprehend nature by means of exact concepts." The mathematician, as such, does not make that assumption and does not seek for relationships in the outer world.

Is the assumption correct? Undoubtedly it is admissible, and as a working hypothesis it is undoubtedly very useful or even indispensable to the student of external nature; but is it true? The mathematician, as man, does not know although he greatly cares. Man, as mathematician, neither knows nor cares. The mathematician does know, however, that, if the assumption be correct, every relationship that is valid in nature is, *in abstractu*, an element in his domain, a subject for his study. He knows, too, at least he strongly suspects, that, if the assumption be not correct, his domain remains the same absolutely. The two realms, of mathematics, of natural science, like the two attitudes, the mathematician's and that of the nature student, are fundamentally distinct and disparate. To think logically the logically thinkable—that is the mathematician's aim. To assume that nature is thus thinkable, an embodied rational logos, and to discover the thought supposed incarnate there—these are at once the principle and the hope of the student of nature.

Suppose the latter student is right, suppose the outer universe really is an embodied logos

of reason, an infinitely intricate garment ever weaving and ever woven, warp and weft, of logically determinate relationships, does that imply that all of the logically thinkable is incorporated in it? It seems not. A cosmos, a harmoniously ordered universe, one that through and through is self-compatible, can hardly be the whole of reason materialized and objectified. There appears to be many a rational logos. At any rate the mathematician has delight in the construction and contemplation of divers systems that are inconsistent with one another, though each is composed of consistent relationships. He constructs in thought, as witness the geometry of hyperspaces, ordered worlds, worlds that are possible and logically actual, and he is content not to know if any of them be otherwise actual or actualized. There is, for example, a Euclidean geometry and there are infinitely many kinds of non-Euclidean (see *NON-EUCLIDEAN GEOMETRY*). These theories regarded as "applied" mathematics, regarded, that is, as *true* descriptions of some one actual space, are incompatible. In our universe, to be specific, if it be, as Plato thought and nature science takes for granted, a geometrized or geometrizable affair; then one of these geometries may be, none of them may be, not all of them can be, objectively valid in it. But in the vaster world of thought, in the world of pure mathesis, all of them are valid; there they coexist, and interlace among themselves and others as differing strains of a hypercosmic harmony.

A geometry, indeed any mathematical theory, consists of a definite system of determinate compatible principles or assumptions or hypotheses or postulates (commonly called axioms) together with their implications, their logically deducible consequences. Accordingly, natural science, the term being broadly employed to signify knowledge that is ultimately dependent upon "observation and experiment," cannot be or become strictly mathematical. It aspires to be the *character*, and approximates and imitates the *form*, of mathematics, but it can never really attain either. Mathematics is concerned with implications, not applications. Such terms as "applied mathematics," "mathematical physics," and the like, are indeed in common use, but the signification, rightly understood, is always that of a mixed doctrine, a doctrine that is thoroughly analyzable into two disparate parts: one of these consists of determinate concepts formally combined in accordance with the established canons of ratiocination, *i.e.*, it is pure mathematics and not natural science; the other is matter of observation and experiment, *i.e.*, it is natural science and not mathematics. No fiber of either component is a filament of the other. Whether the behavior of natural phenomena is or is not exactly describable by mathematical formulae can never be ascertained, for the means to "natural knowledge," *viz.*, observation and experiment, are fallible by nature, and, however refined or prolonged, are incapable of yielding absolute exactness or certainty. Of any so-called law of nature, "the most, the last, the best that can be said" is that its agreement with the facts is so nearly perfect that every discrepancy, if any there be, has escaped detection.

Cannot the like be said of mathematics? In

the foregoing conception of mathematics it has indeed been tacitly assumed that some ideas are completely determinable, that there are possible systems of postulates absolutely free alike from obscurity and from interior contradiction, that the postulates of such a system import a perfectly definite body of ascertainable implications, and that there is a perfect standard of logic quite independent of time and place and of the defects and idiosyncrasies of individual reasoners. May not these assumptions, some or all of them, be incorrect? There are some grounds, historical and biological, for suspecting that such may be the case. Such an admission, however, whether tentative or unconditioned, has by no means the effect of undefining mathematics or of dethroning the science from its commanding position among the knowledges. It would indeed leave man without the possession, even without the hope, of *absolute* knowledge, but, among all the forms of actual or potential proximate knowledge, mathematics would still rightly rank as highest. It would indeed be marked by a degree of uncertainty or indeterminateness or relativity or inexactness, *viz.*, that degree of inexactness which by supposition would belong to *all* meanings and standards. Hence it would not be peculiar to mathematics, but would be common to it and every other science. But every such "other science" has an *additional* mark of indeterminateness, the characteristic inexactness of all possible observation and experiment. In any case, then, the observational and experimental sciences are, in respect to certainty and exactness, hopelessly inferior to mathematics.

But in all ages it has been the faith of the mathematician that complete determination of concepts and absolute rigor of demonstration are in fact attainable, not, however, in the realm of observation and experiment, but in the world of pure thought. It is, then, in that world, where all *entia* dwell, where is every type of order and every manner of correlation and every variety of relationship and every form of implication, it is in this infinite ensemble of eternal verities whence, if there be one cosmos or many of them, each derives its character and mode of being,—it is there that the spirit of mathesis has its home and its life.

Is it a restricted home, a narrow life, static and cold and gray with logic, without artistic interest, devoid of emotion and mood and sentiment?

That world, it is true, is not a world of solar light, it is not clad in the colors that glorify the things of sense, but it is an illuminated world, and over it all and everywhere throughout are hues and tints transcending sense, painted there by radiant pencils of psychic light, the radiance in which it lies.

It is a silent world. Nevertheless, in respect to the highest principle of art—the interpenetration of content and form, the perfect fusion of mode and meaning—it even rivals music.

In a sense, it is a static world, like those of the sculptor and the architect. The figures, however, which reason constructs and the mathetic vision beholds, transcend the temple and the statue, alike in simplicity and in intricacy, in delicacy and in grace, in symmetry and in poise.

Not only are this home and this life, thus

rich in æsthetic interests, really controlled and sustained by motives of a sublimed and supersensuous art, but the religious aspiration, too, finds there, especially in the beautiful doctrine of invariants, the most perfect symbols of what it seeks—the changeless in the midst of change abiding things in a world of flux, configurations that remain the same despite the swirl and stress of countless hosts of curious transformations.

Literature.—The literature having for its object the exposition of the nature and principles of mathematics is extensive. By far the most important recent contribution, which at the same time serves to introduce the reader to the chief memoirs in the field, is B. Russell's 'The Principles of Mathematics,' vol. I. For an excellent critical review of the principal modern attempts to define mathematics, the reader may be referred to Professor M. Bôcher's 'The Fundamental Conceptions and Methods of Mathematics' ('Bull. of the American Math. Soc.,' vol. XI.).

CASSIUS J. KEYSER,
Adrain Professor of Mathematics,
Columbia University.

Mather, Māt'h'er, Cotton, American colonial clergyman, son of Increase Mather (q.v.): b. Boston 12 Feb. 1663; d. there 13 Feb. 1728. He entered Harvard College at 11, and at his graduation in 1678 President Oakes expressed his expectation that he would resemble his venerable grandfathers John Cotton and Richard Mather, who should be united and flourish again in him. He was early distinguished for piety, and in his 14th year began a system of rigid and regular fasting and vigils which he continued through life. He was occupied after leaving college with teaching, in 1680 became the assistant of his father in the pastorate of the North Church, Boston, and in 1684 was ordained as his colleague. When, at the report of the landing of the Prince of Orange in England, Governor Andros was seized and imprisoned in Boston, Cotton Mather prepared the public declaration justifying the measure. But it is in connection with proceedings concerning witchcraft that he is most generally known. In 1685 he published his 'Memorable Providences relating to Witchcraft and Possessions,' narrating cases which had occurred at intervals in different parts of the country; and during the witchcraft excitement in Salem in 1692 was a prejudiced investigator in the matter, publishing the next year his 'Wonders of the Invisible World,' in order to confirm believers in that kind of demonic possession. In 1702 appeared his greatest work, 'Magnalia Christi Americana,' an ecclesiastical history of New England concerning which he was admitted to know more particulars than any other man. Though strongly marked by his partialities and prejudices, its somewhat quaint and grotesque character, its admixture of superstition, learning, and ingenuity, make it still interesting. In 1713 his 'Curiosa Americana' was read before the Royal Society of London, and he was elected a member of that body, being the first American to receive this distinction. In its 'Transactions' in 1721 appeared an account of the practice of inoculation for the smallpox, recently introduced by Lady Mary Wortley Montagu; and it was by the efforts of Mather in connection with Dr.

Boylston, against both professional and popular prejudice, that the operation was first performed in Boston. His 'Essays to Do Good' (1710) was admitted by Dr. Franklin to have influenced some of the principal events of his life; and his 'Christian Philosopher' and 'Directions for a Candidate of the Ministry' enjoyed high repute. His 'Parentator' (1724) is a life of his father, Increase. Vain and pedantic as he was and narrow and credulous as he showed himself to be in regard to witchcraft and other topics of his time, he was in many directions a useful, public-spirited citizen who deserves to be regarded more leniently by posterity than has sometimes been the case. Consult: 'Life' by Samuel Mather (1729); Pond, 'The Mather Family' (1844); Marvin, 'Life and Times of Cotton Mather' (1892); Wendell, 'Cotton Mather' (1891); Tyler, 'History of American Literature' (1881).

Mather, Increase, American colonial divine son of Richard Mather (q.v.): b. Dorchester, Mass., 21 June 1639; b. Boston 23 Aug. 1723. He was graduated at Harvard College in 1656, and in 1658 at Trinity College, Dublin. He afterward preached in Devonshire and the island of Guernsey, and on the Restoration was urged to conform and settle in England; but he refused, and on his return to Boston was invited to preach to the North Church, of which he was ordained pastor in 1664. This office he held for 62 years. He was a member of the synod of 1679, and drew up the propositions which were adopted concerning the proper subjects of baptism. In 1681 he was elected president of Harvard College, but the reluctance of his church to relinquish him induced him to decline the position. In 1684 the office was again offered him, and he accepted it with a stipulation that he should retain his relation to his people. He continued in this station till 1701, when he retired in consequence of an act of the general court requiring the president to reside in Cambridge. He received the first diploma for the degree of D.D. that was granted in America. When in 1683 Charles II. demanded that the charter of Massachusetts should be resigned into his hands, Mather was foremost in opposing the measure; and when that monarch annulled the charter in 1685, he was sent to England as agent for the colonies. He was in England during the revolution of 1688, and, having found it impossible to obtain a restoration of the old charter, accepted a new one, under which the appointment to all the offices reserved to the crown was confided to him. He returned in 1692, when the general court appointed a day of thanksgiving for his safety and for the settlement of the dispute. He is stated to have condemned the violent proceedings which followed relating to witchcraft. He was accustomed to spend 10 hours every day in his study, and always committed his sermons to memory. One tenth part of all his income was devoted to purposes of charity. He was the author of 92 distinct publications. His 'Remarkable Providences' was republished in the 'Library of Old Authors' (1856), and other works by him are: 'Cometographia, or a Discourse Concerning Comets' (1683); 'Cases of Conscience Concerning Witchcraft' (1693). Consult: Pond, 'The Mather Family' (1844); Walker, 'Ten New England Leaders' (1901).

Mather, James Marshall, English non-conformist clergyman and author: b. Darlington 1851. He studied architecture in Lincoln and later prepared for and entered the nonconformist ministry. He has published: 'Life and Teachings of John Ruskin,' which has passed through nine editions; 'Popular Studies in 19th Century Poets'; 'Lancashire Idylls'; 'The Sign of the Wooden Shoon'; 'By Roaring Loom'; etc.

Mather, Richard, American colonial divine: b. Lowton, Lancashire, England, 1596; d. Dorchester, Mass., 22 April 1669. He became a schoolmaster at Toxteth Park, near Liverpool, at the age of 15; studied at Brazenose College, Oxford, in 1618; was ordained in the English Church soon after, and became the minister of Toxteth, in which position he remained 15 years. He was suspended for non-conformity to the ceremonies of the Established Church in 1633, and though soon restored by the influence of friends was again silenced in the following year. He therefore decided to emigrate to New England, arriving in Boston in August 1635. The next year he became pastor of the church in Dorchester, and held that position till his death. He was one of the compilers of the 'Bay Psalm Book,' and assisted to frame in 1648 a model of discipline known as the Cambridge Platform. He married for his second wife the widow of John Cotton (q.v.). His 'Journal, Life and Death' was issued by the Dorchester Historical Society in 1850. Consult: Increase Mather, 'Life and Death of Richard Mather' (1670); Tyler, 'History of American Literature,' Vol. II. (1881).

Mather, William Williams, American geologist: b. Brooklyn, Conn., 24 May 1804; d. Columbus, Ohio, 26 Feb. 1859. He was graduated from West Point in 1828 and was an assistant professor of chemistry and geology there, 1829-35. After a short period spent as professor of chemistry at the University of Louisiana (1836), he undertook the superintendence of a geological survey of the 1st district of New York State which included the Hudson River counties, a labor which lasted from 1836 to 1844. He was also state geologist of Ohio 1837-40, and of Kentucky 1838-9, and from 1842-5, and 1847-50, professor of natural science in the Ohio University at Athens. He contributed frequently to scientific journals, edited the 'Western Agriculturist' for a time and published 'Geology of the 1st Geological District' in 'Natural History of New York' (1843).

Mathers, math'ërz, Helen. See REEVES, HELEN MATHERS.

Matheson, mäh'të-sön, George, Scottish Presbyterian clergyman: b. Glasgow 27 March 1842. He was educated at Glasgow University and although he had lost his sight he entered the ministry of the Kirk of Scotland and was ordained in 1868. He was in charge of St. Bernard's Church, Edinburgh, 1886-95. Among his many published books are: 'Aids to the Study of German Theology' (1874); 'Natural Elements of Revealed Theology' (1881); 'The Psalmist and the Scientist' (1887); 'Sidelights from Patmos' (1897); 'The Sceptre Without a Sword' (1901); 'The Representative Men of the Bible' (1902).

MATHEW — MATINS

Mathew, mǎth'ū, Frank, English novelist: b. Bombay 1865. He was educated at London University and became a solicitor in 1889. He has published: 'Father Mathew: his Life and Times' (1890); 'At the Rising of the Moon: Irish Stories and Studies' (1893); 'The Wood of the Brambles' (1896); 'The Spanish Wine' (1898); 'The Royal Sisters' (1901).

Mathew, Theobald, known as "FATHER MATHEW," Irish temperance reformer: b. Thomastown Castle, County Tipperary, Ireland, 10 Oct. 1790; d. Queenstown, Ireland, 8 Dec. 1856. He was educated at Maynooth College and ordained to the Roman Catholic priesthood in 1814. In 1838 he inaugurated a temperance crusade and his labors in Great Britain and Ireland induced hundreds of thousands to sign the total abstinence pledge. The most conclusive evidence of the benefit of his preaching was the reduction of nearly £600,000 on the duties of spirits imported in Ireland in five years. He made a tour of the United States in 1849-51 and was very successful. Though pensioned by the queen he was never entirely relieved from the burden of debt with which his extended tours had burdened him, and which caused his imprisonment for a time in 1847. Consult, 'Life' by Maquire (1863); F. Mathew, 'Father Mathew: his Life and Times' (1890).

Mathews, mǎth'ūz, Albert, "PAUL SIEG-VOLK," American lawyer and author: b. New York 8 Sept. 1820; d. there October 1903. He was graduated from Yale in 1842 and after studying law was admitted to the New York bar in 1845. He soon acquired an extensive practice and was especially skilled in chancery practice. He found time for literary work despite the claims of his profession, and under the pseudonym, "Paul Siegvolk," published: 'Walter Ashwood,' a once popular love story (1860); 'A Bundle of Papers' (1879); 'Thoughts on Codification of the Common Law' (1881); 'Ruminations: The Ideal American Lady and Other Essays' (1892); 'A Few Verses' (1893); etc. In the early part of his career he was a close friend of N. P. Willis (q.v.), whom he aided in establishing 'The Home Journal.'

Mathews, Charles, English actor: b. London 28 June 1776; d. Plymouth, England, 28 June 1835. He made his début as an actor in Richmond in 1793 and was subsequently engaged for some years in Dublin and London. In 1818 he made a hit as a professional entertainer in his 'At Home.' He continued in this class of work, making two successful trips to the United States and returning, presented in England with great success 'A Trip to America.'

Mathews, Charles James, English actor: b. Liverpool 26 Dec. 1803; d. Manchester, England, 24 June 1878. He was the son of Charles Mathews (q.v.) and was educated as an architect, but abandoned that calling for the stage. As a light comedian he was very successful, but his attempts at managing Covent Garden and the Lyceum Theatre in London were failures. He made several trips to the United States, Paris and Australia, presenting an entertainment similar to his father's famous 'At Home.'

Mathews, Ferdinand Schuyler, American artist and author: b. New Brighton, N. Y., 30 May 1854. He was educated at Cooper Institute, studied art in Italy and has made a spe-

cialty of decorative designing. He has contributed extensively to the magazines both as illustrator and writer, in the latter field dealing chiefly with subjects which come within his own profession. He has published: 'The Writing Table of the 20th Century' (1900); 'The Field-Book of American Wild Flowers' (1902); etc.

Mathews, Shailer, American educator: b. Portland, Maine, 26 May 1863. He was graduated from Newton Theological Institution in 1887 and studied in Berlin. In 1887 he was appointed assistant professor of rhetoric at Colby University, and in 1889 accepted the chair of history and political economy, which he occupied until 1894, when he was made junior dean of the Divinity school in the University of Chicago and professor of New Testament history. He has published: 'Select Mediæval Documents' (1891-1900); 'The Social Teaching of Jesus' (1897); 'A History of New Testament Times in Palestine' (1899); 'The French Revolution: a Sketch' (1901); 'Principles and Ideals for the Sunday School' (1903); etc.

Mathews, William, American author: b. Waterville, Maine, 28 July 1818. He studied law at Harvard and was admitted to the bar in 1838, practising for a time in Waterville, but soon abandoned law for journalism. In 1862 he was appointed professor of English and rhetoric at the University of Chicago, but in 1875 resigned in order to devote himself exclusively to literature. Among his many books are: 'Getting on in the World' (1873); 'The Great Conversers' (1874); 'Oratory and Orators' (1879); 'Men, Places and Things' (1888); 'Nugæ Literariæ' (1896); etc.

Mathews, William Smythe Babcock, American musical writer and editor: b. Loudon, N. H., 8 May 1837. He obtained his musical education in Boston and became a teacher in 1853; he was for a time engaged at the Wesleyan Female Seminary in Georgia, but in 1867 he removed to Chicago, where he has been prominent as an organist and engaged in editorial work and criticism of music on the leading Chicago papers. In 1891 he established the magazine 'Music,' and edited it until 1903, when it became a part of the 'Philharmonic.' He is the author of: 'How to Understand Music' (1880-8); 'Music and Its Ideals' (1897); 'Dictionary of Musical Terms' (1895); 'Popular History of Music' (1901); 'The Great in Music' (1900-03); etc.

Mat'in, a large hound-like French dog, resembling the great Dane, but having a rough coat. The head is elongated, the forehead flat, the ears pendulous toward the tips; color, yellowish-fawn or whitish. It is commonly employed in France as a sheep-dog and watchdog.

Mat'ins, the daily office of Morning Prayer in the Anglican communion. It is composed in part of the pre-Reformation offices of Matins and Lauds. In the Roman Catholic Church, the first portion of the Divine Office, with which Lauds are usually associated. On Sundays and double feasts matins have three nocturns; on simple feasts and week-days, one nocturn. Easter and Pentecost have each only one nocturn, with three psalms. After private prayer versicles and responses are recited; the invitatory psalm follows. In the first nocturn are said three psalms on feast days, 12 when the

office is of the Sunday, and three lessons from Scripture; the second and third nocturns have each three psalms, and the lessons are chosen from the patristic writings for the second, and from some commentary on the Gospel of the day of the third nocturn.

Matrarchate, position or power of a matriarch, a name formerly given to the wife of a patriarch. Among the Indians the mother is considered of superior importance in families, clans, or tribes. Job's wife, Xantippe, and others in history have been called matriarchs. In certain primitive tribes the mother, in line of descent and inheritance, takes precedence of the father.

Matrimony Vine. See LYCIUM.

Matronalia, the first of March, the New Year's day of the Roman religious calendar, sacred to Juno, the deity of matrons. On this festival-day wives expected presents from their husbands, and themselves gave an entertainment to the household slaves.

Matsukata, Masayoshi, mǎ-si-ō'shē māt-soo-kǎ'tǎ, COUNT, Japanese statesman: b. Satsuma 1835. He was son of a samurai, but fell in with the Radical party; was made head of the prefecture (or *ken*) of Hida after the revolution; was prominent in the tax reform of 1875; represented Japan in several industrial exhibitions; was a member of the Cabinet, in 1880 as minister of commerce, in 1881 as minister of finance, and, with the same portfolio, as prime minister from 1891 to 1893. His great work was in 1896-7, when he formed a new cabinet, carried through the gold standard, set Japanese credit on its feet, but he was forced to retire because of the ill-success of his scheme of taxation.

Matsys, māt-sis', or Massys, Quentin, Flemish painter: b. Antwerp about 1460; d. there between 13 July and 16 Sept. 1530. A blacksmith until he was 20, legend says that he turned artist to win the love of a painter's daughter. He was acquainted with many of the notables of the day, including Dürer, Erasmus, and Sir Thomas More. Much of his present fame is due to genre pictures, especially of misers and money-changers, which are not his work, but that of his school, among them his son Jan, whose 'Misers' is at Windsor Castle. Matsys' own work is styled a connecting link between Van Eyck and the later Dutch realists; apart from such excellent portraits as those of Maximilian of Austria and Petrus Aegidius, it is mostly religious in theme. The 'Burial of Christ,' an altarpiece for the Antwerp Cathedral, now in the Antwerp Museum, and the 'Story of St. Anne,' now in the Brussels Gallery, are the best examples of his work.

Mat'tawa, a river in Canada, the source of which is Trout Lake, east of Lake Nipissing. It flows east a distance of about 50 miles and enters the Ottawa River at Mattawa. This river forms part of an almost continuous waterway from the Ottawa River to Lake Huron, and before the Canadian Pacific railroad was built this water route was much used for transportation and travel.

Matteawan, māt-te-a-wōn', N. Y., village, in Dutchess County; on Fishkill Creek, and on the New York, N. H. & H., and the Newburg, D. & C. R.R.'s; about 45 miles north of New York and two miles east of the Hudson River. The first permanent settlement was made in

1804; but there had been trading posts in the vicinity in the 18th century. Matteawan is in an agricultural region, and has considerable trade in fruit, potatoes, and dairy products. The industrial establishments are hat factories, novelty works, machine-shops, silk mills, coal and lumber yards. The prominent buildings are the State Hospital for the Criminal Insane, New Hospital, Highland Hospital, and the Howland Circulating Library. Pop. (1900) 5,807.

Mattei, māt-tā'ē, Tito, Italian musician and composer: b. Campobasso, Italy, 24 May 1841. He was educated in Naples. He was accorded the degree of professor in Saint Cecilia's Academy at Rome when he was 11 and was also elected a member of the Philharmonic Society in Florence and other cities. He gave his first concert when 15 and afterward made tours of Europe, but in 1863 settled in London and confined his concert tours to Great Britain, and in 1870 he conducted an Italian opera at the Lyceum theatre. He is the composer of hundreds of songs and pianoforte pieces, many of which have become widely popular, and the operas: 'Maria di Gand'; 'La Prima Donna'; etc.

Matter, in physics, mechanics and chemistry, the tangible substance of which the world external to our minds is composed, and which is characterized by the resistance which it opposes to muscular efforts exerted upon it. Since we can know it only through the mediation of our senses, its actual objective reality has often been questioned by philosophers and metaphysicians; and in order to avoid doubtful points of this sort it is frequently defined merely as a "physical concept," without making any hypothesis as to its objective existence. (Consult Pearson, 'The Grammar of Science.') In physics and chemistry we think and speak of it as having a real existence, however, just as we do in common life. For scientific purposes it is highly important to be able to accurately compare the quantities of matter in two bodies; but the phrase "quantity of matter" is not commonly used in science, the word "mass" (or inertia) being substituted for it. The term "mass" is synonymous with "quantity of matter" so long as the bodies compared are identical in composition and in physical state; but by its use we avoid the uncertainty in the meaning of the longer phrase, when it is applied to bodies of dissimilar composition. Two bodies are said to have "equal masses" under the following conditions: Let the two bodies be conceived to be initially at rest, and free from the action of any external forces whatsoever. Let them then be exposed to the action of equal forces for an equal length of time. If, under these circumstances, the velocities that are produced in the two bodies are equal, the masses of the bodies are also equal, *by definition*. But if the velocities that are produced are unequal, then the masses are also unequal, and are (by definition) proportional to these velocities; the body which is moving the faster being the one whose mass is the less. It would be impossible to carry out an elaborate experiment of this kind every time we wished to compare the masses of a pair of bodies, and it fortunately happens that masses can be compared with great accuracy by merely weighing the bodies against each other in a balance. For equality of weight means that the earth's attractive force is the same upon both; and if (as we

MATTER

know to be the case, by experiment,) the two bodies would fall with the same speed in a vacuum, it follows that equal forces acting upon the two bodies for equal times communicate to them equal velocities; and hence, by the definition of "mass," the masses of the two bodies are equal. It will be noted that mass and weight are two essentially different things, although they are very commonly confused, because they are strictly proportional to each other, according to the most accurate experiments that have yet been made. Yet it is not at all impossible to imagine a state of things in which mass and weight would not be strictly proportional. It is only by experiment, for example, that we know that the earth attracts a body with precisely the same force, whether the body is hot or cold. The attraction between two permanent magnets varies with the temperature, and it may yet be found that gravitative attraction varies in the same way, though to a much smaller extent. Numerous experimenters have in fact fancied that they could detect an effect of this kind, though its reality is not yet admitted. But we can hardly admit that the mass of a body is a function of the temperature; and so we see that the apparently strict proportionality between mass and weight is not at all a necessity of thought, but merely an experimental fact, which may any day be shown to be nothing but a close approximation to the actual truth.

So far as we know, matter can neither be destroyed nor created by any experimental means at our command, nor by any process now operative in nature. This great fact is often called the "law of the conservation of matter," and it appears to be rigorously true. As has been pointed out above, future experiment may show that the weight of a body depends to a slight extent upon its temperature, and it may also be found that the weight of a chemical compound is not always precisely equal to the sum of the weights of its constituents; but it is believed that any irregularities of this sort that may be discovered will hold true of the weight only, and will not affect the mass; and that the weight will also return to its original value when the substance that is weighed is brought back to the same chemical and physical condition again. The gravitative action of matter is one of its most singular attributes, and one which we are still far from understanding. It is apparently true that every particle of matter attracts every other particle with a force which is directly proportional to the product of the masses of the two particles, and inversely proportional to the square of the distance between them, and independent of every other circumstance. It is not certain that this law holds true, nor that the attraction exists at all, at distances comparable with the distance from the earth to the fixed stars, but it appears to hold rigorously at distances commensurate with the dimensions of the solar system. Electric and magnetic forces may be either attractive or repulsive; but gravitative action is probably always attractive, the only phenomena which would countenance the opposite view being the apparent repulsion that the sun exerts upon the tails of comets, and upon the coronal streamers that are seen at the time of a total solar eclipse.

Matter exists in three (or perhaps four) physical states. All ordinary bodies, for example, may be classified, roughly, either as solids

or fluids; fluids being further subdivided into liquids and gases. This classification is not all that could be desired, since there are certain bodies (such as wax) which have certain characteristics of the solids, and certain others of the liquids. A more complete and systematic classification is hardly practicable, however, in the present article. A solid body may be defined as a body capable of resisting a considerable shearing stress. (See ELASTICITY.) Solid bodies usually have a considerable tensile strength also. A solid does not yield continuously to a small deforming force; it resists deformation, and its resistance increases as the deformation increases. A fluid, on the other hand, is a substance having almost no shearing strength, and offering very little resistance to forces that tend to change its shape. A fluid yields continuously to a deforming force, and a force that will deform it at all will deform it indefinitely, so long as it is allowed to act. Considering the subdivision of fluids into gases and liquids, we may say that a gas is a fluid that presses continuously and in every direction upon the walls of the vessel containing it, and which follows them indefinitely if they retreat. A gas, if left to itself, tends to expand infinitely in all directions. A liquid is a fluid which does not follow the walls of the containing vessel if they retreat, and which has no tendency to expand indefinitely if left to itself. (For the prevalent theories regarding the constitution of matter, see GASES, KINETIC THEORY OF; MOLECULAR THEORY.)

When a gas is rarefied very highly by a mercury vacuum pump, it exhibits properties which are different in many respects from those manifested by gases in the ordinary state of density. The pressure in such a rarefied gas, for example, may be different in different directions; so that in this respect, at least, the rarefied medium resembles a solid rather than a gas or liquid. Mechanical and electrical properties are also observed at high exhaustions which cannot be reproduced at ordinary pressures; and for these and other reasons Crookes considered that a gas, when under only (say) the millionth or ten millionth of an atmosphere of pressure, may be fairly said to constitute a "fourth state of matter," which he considered to be as different from the gaseous state as the gaseous state is from the liquid state. At first thought this appears to be an extreme and hardly a justifiable view; but it must be remembered that Andrews showed that the distinction between a liquid and the gas or vapor obtained from it by evaporation ceases to exist at temperatures higher than a certain critical value peculiar to each substance. (See CRITICAL POINT.) This temperature is about 88° F. for carbon dioxide, and at temperatures progressively higher than this the isothermals of carbon dioxide approximate with increasing closeness to the hyperbolas of a perfect gas. It might be thought that a critical state exists with reference to the solid and liquid states; but this is still somewhat doubtful. It appears probable that no such state exists between a solid and its liquid, unless the solid is crystalline, and its existence has not been established even for this case.

See MOLECULAR THEORY; GASES, GENERAL PROPERTIES OF; ELECTRON; SOLUTION; ETHER; VACUUM; etc. Consult, also, Tait, 'Properties of Matter'; Kimball, 'Physical Properties of Gases'; Poynting and Thomson, 'Properties of

Matter'; Risteen, 'Molecules and the Molecular Theory of Matter'; Lehmann, 'Molekularphysik.'

Matterhorn, măt'tēr-hörn, Mount. See CERVIN, MONT.

Matteeson, măt'ē-sôn, **Tompkins Harrison**, American artist: b. Poughkeepsie, N. Y., 9 May 1813; d. Sherbourne, N. Y., 2 Feb. 1884. His early lessons in art were from an Indian; otherwise he was mostly self-taught until after the success of his 'Spirit of '76,' when he settled in New York and studied in the National Academy. From 1851 until his death his home was Sherbourne. For a time he was a member of the New York legislature. His themes were historical or from American country life, and his best known pictures are 'The First Sabbath of the Pilgrims,' 'Examination of a Witch,' 'Eliot Preaching to the Indians,' 'Rip Van Winkle's Return from the Mountains,' 'At the Stile,' and 'Foddering Cattle.'

Matthew, Gospel of. See GOSPELS.

Matthew Town. See INAGUA, GREAT.

Matthews, măt'h'uz (James) **Brander**, American author: b. New Orleans, La., 21 Feb. 1852. Graduated from Columbia in 1871, and from the Columbia Law School in 1873, he was admitted to the New York bar (1873), began to contribute to the magazines in 1873, later turned wholly to literature, and in 1892 was appointed professor of literature in Columbia. In 1898 he became professor of dramatic literature. He was a founder of The Players and Authors clubs, of the Dunlap Society and the American Copyright League, and of the Columbia University Press. In 1889-91 he was president of the Nineteenth Century Club. He wrote several dramatic works, among them 'This Picture and That'; 'A Gold Mine' (with G. H. Jessop); 'On Probation' (also with Jessop); and 'Peter Stuyvesant' (with Bronson Howard). His published volumes include, from an extensive list, the following: 'French Dramatists of the Nineteenth Century' (1881); 'In Partnership' (with H. C. Bunner; 1884); 'A Secret of the Sea, and Other Stories' (1886); 'Pen and Ink' (1888); 'American Literature' (1896); 'Outlines in Local Color' (1897); 'A Confident To-morrow' (1898); 'The Action and the Word' (1900); 'The Historical Novel, and other Essays' (1901); 'Parts of Speech: Essays in English' (1901); 'The Development of the Drama' (1902). He is perhaps best known for his critical papers, marked by keen analysis and a style of much distinction. Some of his earlier writings appeared over the signature 'Arthur Penn.'

Matthews, Edmund Orville, American naval officer: b. Baltimore 24 Oct. 1836. He was graduated from the United States Naval Academy in 1855 and served in the navy with several promotions before the outbreak of the Civil War, in which he served with distinction. In 1869-73 he was in command of the torpedo boat corps at Goat Island, Newport Harbor, and he commanded the Brooklyn in the Asiatic squadron in 1885-7; he was a member of the board of inspection and survey in 1891-4, and in 1897 was raised to the rank of rear-admiral. He was appointed president of the examining board in 1898 and served until he was retired in that year.

Matthews, Franklin, American journalist: b. St. Joseph, Mich., 14 May 1858. He was graduated from Cornell University in 1883, was reporter and editor on the Philadelphia Press 1886-90, and since the last named year has been editor of the New York Sun. He has published 'Our Navy in Time of War' (1899); 'The New-born Cuba' (1899).

Matthews, Stanley, American jurist: b. Cincinnati, Ohio, 21 July 1824; d. Washington, D. C., 22 March 1889. He was graduated from Kenyon College in 1840, studied law and was admitted to the bar in 1842, when he established a practice in Maury County, Tennessee, but returned to Cincinnati in 1844 and engaged in practice there. He was editor of the Cincinnati Herald, an anti-slavery journal in 1846-9, and held various political offices, and in 1855-6 was a State senator. In 1858 he was appointed United States district-attorney for the southern district of Ohio, but at the outbreak of the Civil War in 1861 entered the volunteer service and was commissioned lieutenant-colonel and was a colonel when in 1863 he resigned to accept the seat of judge of the superior court of Cincinnati. He was elected United States Senator in 1877 after having acted as counsel before the electoral commission, and in 1881 he was appointed a justice of the Supreme Court of the United States.

Matthias, ma-thi'as, a disciple of Jesus, probably one of the 70, who was chosen by lot to take Judas Iscariot's place among the 12. Little is known of him. Even early legend confused him with Matthew, and an apocryphal gospel was attributed to him. In the Roman Catholic Church 24 February, in the Greek 9 August, is sacred to him. The 'Acts of Andrew and Matthias' make him a missionary in Africa.

Matthias (Ger. măt-tē'ās), emperor of Germany: b. Vienna 24 Feb. 1557; d. 20 March 1619. He was a younger son of Maximilian II. (q.v.). In 1612-19 he was emperor of the Holy Roman Empire, having been elected on the death of his brother Rudolf II. (q.v.). His reign was an unsuccessful one. He attempted in vain to suppress by decree the Catholic League and Protestant Union. In 1628 the Thirty Years' war began.

Matthias Corvinus, kôr-vē'noos, THE GREAT, king of Hungary: b. Klausenburg, Transylvania, 27 March 1443; d. Vienna 6 April 1490. The second son of John Hunyady, he was imprisoned in Bohemia by his father's enemies, who strongly but unsuccessfully opposed his candidacy for the crown of Hungary in 1458. Another party of opposition attempted to make the Emperor Frederick III. king of Hungary; but Matthias brought them to terms and in 1463 made peace with Frederick. By the Peace of Olmütz, 22 July 1479, he gained Silesia, Moravia, and Lausitz, and the succession to the crown of Bohemia. In his wars with the Turks he was equally successful and a part of Bosnia was ceded to him by the Porte. War broke out again with the Austrian emperor; Matthias invaded his territory and captured and held Vienna. His court was a centre of scholarly men and his library, called the Corvina, a famous collection. The internal administration of Hungary was greatly improved under Matthias.

Mat'ting. While this term is usually employed to designate floor coverings made from

MATting FIBRES — MATTO-GROSSO

reeds and fibrous grasses, it is a generic term which includes not only the commercial mattings for house floors, which are made in Eastern countries, but a much wider range of articles useful in the domestic economy, and in other employments, such as screens and tatties, sleeping mats (used in India and the East), the matting employed by nurserymen for protecting hotbeds and cold frames, and even some forms of thatch. For the most part mattings are hand-woven, in the finer varieties the warp being cotton or other yarns, and the filling the culms of various sedges, reeds and grasses, an example being the familiar Japanese mattings of the house-furnishing stores. In the Russian bast (q.v.) mattings for nurserymen's use, bast of the linden tree is employed for both warp and filling, very coarsely woven or plaited. The roots of the Khus-Khus (*Andropogon squarrosus*), a perennial grass of India, are woven into fragrant screens for open windows, and also made into awnings. The Taika rush mats of Lormosa are famous as sleeping mats, and the best grades are said to be as fine and soft as cloth, resembling the best Panama hat weaving. Consul Davidson states that a mat of the highest grade, measuring 5 x 6 feet, requires the labor of a girl weaver 120 days, and such mats have sold for 60 to 70 yen (or about \$40). The rush is an unidentified species, but sleeping mats are made from several species of *Cyperus* and *Scirpus* found in Asia, Africa and other countries.

The commercial mattings used for house decoration are for the most part of Chinese and Japanese manufacture. In Japan two species are employed, *Juncus effusus*, the Bingo-i mat rush, which is always manufactured into the costly mats used by the higher classes (and known as Tatamiomote), and *Cyperus unitans*, which is employed for the cheaper grades. The largest importer of these mats is the United States, England, Austria, and Germany, following in the order named. The qualities of the Bingo-i are named as follows: Kinkwanyen, manufactured at Okayama; first quality Aya-mushiro, second quality Aya-mushiro, Damask Aya-mushiro, common Aya-mushiro, manufactured at Bittiro. First quality Somewake-mushiro, common Somewake-mushiro, Damask Hana-mushiro, common Hana-mushiro, manufactured at Bingo; ordinary Hana-mushiro (best quality), manufactured at Chikugo. *Cyperus unitans* produces the Shichito-i mats which are chiefly manufactured in the Oita prefecture. The plant is cultivated both upon upland and irrigated lands. The varieties of mats from this species are known by names as follows: Kikai-ori Hana-mushiro, Damask Hana-mushiro, common Hana-mushiro (two forms), Seidaka Hana-mushiro, manufactured at Bungo. Mattings made from the two species above have been exported in a single year to the value of 650,000 yen, or over \$400,000.

The Chinese and Korean mat rush is *Cyperus tegetiformis*, this species also being used for the manufacture of cuffs and sandals. The India commercial mattings are made chiefly from *Cyperus corymbosus* and *tegetum*; the latter being known as the Calcutta mat rush, while the former is used for the Tinnerley mats which are the finest made in India. They are also made at Palghat, but these are not so fine. In the manufacture of the India mattings the culms are split into two or three parts and then woven into mats

upon a warp of threads previously stretched across the floor of a room. The operator passes the culms with the hand alternately over and under the successive threads of the warp, and presses them home.

It would be difficult to enumerate all of the mattings made in different countries, though mention should be made of the fine and highly prized Niihau mats of Hawaii, produced from *Cyperus levigatus*. Matting is made in Spain and Morocco from *Juncus maritimus*, and in Italy from *Juncus acutus*. Two species of sword rush, *Lepidosperma gladiatum* and *L. flexuosum*, are used by the natives of Australia not only for mats, but for baskets and other articles, and *Leptocarpus mucronata*, found in Asia, Africa and Polynesia, supplies the fibre for the mats with which Chinese boatmen cover their cargoes.

In the United States a handsome and utilitarian form of floor matting is largely manufactured from Slough grass, *Carex fliformis*. Fully described under Fibre (q.v.).

The University of California has recently been experimenting with several species of matting rushes, chiefly *Juncus effusus*, and *J. robustus*, from which a fine sample of matting has been manufactured at a factory in Maine. There is a possibility therefore that rush matting may be produced in the United States, commercially, in the near future.

For matting fibres see also 'Dictionary Economic Products of India,' 'Descriptive Catalogue of Useful Fiber Plants of the World,' and 'The Island of Formosa,' by Jas. W. Davidson. The leaves of many species of palm, in different parts of the world, are used for native mats and mattings, though few of these ever reach commercial importance. See PALMS.

CHARLES RICHARDS DODGE.

Matting Fibres. See FIBRE.

Matto-Grosso, măt'too-grôs'soo, Brazil, the westernmost state, bounded on the north by a range of mountains which separates it from Pará; east by the Araguaia, which separates it from Goyaz; southeast by the Parana, separating it from São Paulo; south by Paraguay; and west by Bolivia; area, 532,445 square miles. It is traversed, northwest to southeast, by a mountain chain, forming the principal watershed between the basins of the Amazon and the Rio de la Plata. From the mountains numerous streams descend through lofty rocky valleys, which gradually spread out into immense plains. The principal rivers are the Guaporé, Juruena, Xingu, Araguaia, Parana with its tributary Pardo, and the Paraguay with its tributaries São Lourenço and Tacuary. The dense forests which cover a great part of the surface have given the province its name, Matto Grosso, signifying "Great Forest." They abound with inexhaustible supplies of the finest timber, and also yield many rare and valuable gums, balsams, and medicinal plants. Cacao, jalap, and maté are of spontaneous growth. Numerous wild animals infest the woods. The state is rich in minerals. There is scarcely a district in which gold has not been found, though the working of the mines has ceased to be profitable. Iron is abundant, but is unworked. Over an extensive region near the centre, diamond mines were long wrought, and at one time yielded a large revenue to the Portuguese government. In other quarters various other gems and crystals are obtained. In many

of the valleys and plains the soil is of remarkable fertility, producing rich crops of rice, millet, mandioc, haricots, cotton, sugar, and tobacco; but the greater part of the surface remains in a state of nature. The state is represented in the chamber of deputies of the Federal government by four members, and in the Federal senate by three senators. Its internal affairs are administered by a state executive and legislature, the latter being chosen by popular vote. The capital of the state is Cuyaba. Pop. (exclusive of Indians) in 1890 92,827.

Mattoon, ma-toon', Ill., city, in Coles County; on the Illinois C., the Peoria, D. & E., and the Cleveland, C. C. & St. L. R.R.'s; about 75 miles east by south of Springfield. It was settled and incorporated in the year 1855. It is situated in an agricultural region in which broom corn is one of the principal products. The chief manufacturing establishments are broom factories, flour mills, grain elevators, wagon and carriage factories, foundries, machine-shops, and repair shops for several railroads. It has a large trade in its manufactured articles, grain, fruit, and live-stock. Some of the prominent buildings are the Old Folks' Home (I. O. O. F.), the public and parish schools, the public library and reading room, and the churches. The electric-light plant is owned and operated by the city. Pop. (1890) 6,833; (1900) 9,622.

Maturin, mā-too-rēn', Venezuela, a town in the state of Bermudez, formerly the capital of the state of Maturin, now united with Bermudez. It is on the Guarapiche branch of the Orinoco delta, 25 miles by rail above its port Colorado, and 40 miles from the sea. A considerable trade with the West Indies, principally in cattle and hides, is carried on. In the neighborhood are extensive plantations of cacao. Pop. (1890) 14,473.

Matzoen', a milk food used in Armenia; prepared by exposing milk in open vessels to a heat of 90° F., and when coagulation takes place the curd is broken up by a churning process, and a little salt is added.

Mat'zoth, the Hebrew name for a kind of unleavened bread or biscuit eaten by the Jews during the feast of the Passover.

Mauch Chunk, māk chūnk, Pa., a town and county-seat of Carbon County, on the Lehigh River, the Lehigh Coal and Navigation Company's Canal, and on the Central of N. J., and the Lehigh V. R.R.'s; 46 miles west by north of Easton. The town is picturesquely built on the side of a mountain rising 1,500 feet from the river, here winding through a narrow, deep ravine, and each summer is visited by thousands of tourists, attracted by the beauty of the surrounding natural scenery. The town has a county building, Y. M. C. A. building, the Dimmick Memorial Library, is electrically lighted, and has electric street railways. It has a number of foundries, shoe factory, car shops, etc., but is best known as an important coal centre, marking the extreme boundary of the anthracite coal region of Pennsylvania; it was established by the Lehigh Coal and Navigation Company in 1818. The Summit Hill coal mines, nine miles southwest of the town, are among the best in the State. The coal is now carried through a tunnel, but was formerly transported to Mauch Chunk by a gravity railroad known as the Switchback, which has become famous as an ex-

citing pleasure route for tourists. Mounts Pisgah and Jefferson, the summits of which are reached by the Switchback railroad; Prospect Rock, Flagstaff Peak, and Glen Onoko are points of considerable interest, commanding splendid views of the Lehigh Valley. Pop. (1900) 4,029.

Maud Mul'ler, a poem by J. G. Whittier, first published in the 'National Era,' December 1854. It is a ballad reciting a romantic passage in the lives of a susceptible judge and a country girl.

Maudsley, mād'z'li, Henry, English alienist; b. Giggleswick, Yorkshire, 6 Feb. 1835. He was graduated in medicine from the University of London in 1857, was editor of the 'Journal of Mental Science' in 1863-78, in 1869-70 was professor of medical jurisprudence in University College, London, and in 1869 became a fellow of the Royal College of Physicians. A list of his works includes: 'Physiology and Pathology of the Mind' (1867); 'Lectures on Body and Mind' (1870); 'Responsibility in Mental Disease' (1874); 'The Physiology of Mind' (1883); 'Natural Causes and Supernatural Seemings' (1886).

Maule, mow'lā, Chile, a maritime province bounded north by the province of Talca, east by Linares and Nuble, south by Concepcion, and west by the Pacific Ocean. Area, 2,930 square miles. It takes its name from its principal river. The well wooded Coast Range, nearly 3,000 feet high, occupies the great portion of the surface. Agriculture and its allied occupations constitute the principal industries. Capital Caguenes; chief port Constitucion. Pop. of province (1895) 119,791.

Maule, Chile, a river rising in the Andes and after a westerly course of about 150 miles, 52 of which are navigable for small vessels, flowing into the Pacific Ocean near the village of Constitucion, 99 miles northeast of Concepcion.

Maulmain, māl-mān', or Moulmein, mowl-min', Burma, the capital of the Tenasserim division, and a seaport near the mouth of the Salwin River, on the Gulf of Martaban. The town, comparatively modern, dating from 1826, is regularly built on level ground between the river and a range of wooded hills, on whose heights are the gilded spires of numerous pagodas and elegant residences, commanding fine views of beautiful scenery. Maulmain has numerous public buildings, churches, chapels, and missionary establishments, several charitable and educational institutions, barracks, a hospital, jail, etc. A considerable trade is carried on with Indian ports, the chief exports being teak-wood and rice, the imports, piece goods, hardware, provisions and general merchandise. Pop. (1901) 58,446, besides native Burmese, comprising Hindus, Eurasians, Armenians, Chinese, Malays, Jews, and Europeans.

Maumee, mā-mē', a river formed by the junction of Saint Mary's and Saint Joseph's rivers at Fort Wayne, Ind. It flows northeast across the northwest corner of the State of Ohio, and enters Lake Erie through Maumee Bay. The river is 150 miles long and navigable 12 miles from its mouth to the Maumee Rapids. The Miami and Erie Canal, which connects Lake Erie with the Ohio River, begins at the head of navigation on the Maumee, and follows the

course of the river to Defiance, then turns south. The Maumee Bay, a shallow body of water, has been improved by deepening and straightening the channel. Toledo is at the mouth of the Maumee. The Maumee River was a part of one of the water routes much used by the early missionaries and explorers. The distance from the head waters of the Maumee to the Wabash River is only about 25 miles.

Mauna Kea, mow'nä kă'ä, Hawaii, an extinct volcano, the highest peak in the Pacific, 13,805 feet in altitude. See HAWAII.

Mauna Loa, mow'nä lö'ä, Hawaii, a volcano 13,760 feet high, with a crater nearly five miles in circumference, and vertical precipices on the inner side 500 to 600 feet high. Mauna Loa is situated in the central southern portion of Hawaii, and on its eastern slope is the still larger crater of Kilauea, about nine miles in circumference, but apparently having no communication with Mauna Loa, their periods of activity being independent of each other. See HAWAII; KILAUEA.

Maundy (män'di) **Thursday** is the Thursday in the Passion week. Another popular old name of the day is Shere Thursday, from the custom of shearing the hair which the priesthood used to observe. It used to be the custom in England and other countries, and still is in Austria, for the sovereign to wash the feet of a certain number of poor persons, and to send them away with presents in the shape of food, clothing, and money. This ceremony is in commemoration of the act of Christ, who washed his apostles' feet on the occasion of the last supper.

Maupassant, Henri René Albert Guy de, ön-rê rê-nä ä'l-bär gë dé mö-pä-sän, French novelist: b. Chateau Miromesnil, Seine-Inferieure, France, 5 Aug. 1850; d. Paris 6 July 1893. He began his career as a clerk in the navy department in Paris and also served for a time in the French army during the Franco-Prussian war. The novelist Flaubert, a friend of his mother's, was his godfather, and the youth took him as his model in the art of composition. After years of practice, during which he wrote and destroyed a great number of manuscripts, he allowed a short story, 'Boule de Suif,' to appear in 1880, a work which displayed the greatest finish and at the same time allied him to the naturalistic school of fiction. In the same year he published a book of verse, 'Des Vers,' and a drama, 'Histoire du vieux Temps.' After this he continued to cultivate the short story and was very soon recognized as one of the greatest writers of short stories the 19th century had seen. In spite of the perfection of art displayed in their construction neither his brief tales nor his novels form pleasant reading. They compel admiration, but they are dominated by pessimism and in his later work the traces of an unbalanced mind may be plainly seen. In 1892 De Maupassant's mental malady occasioned the cessation of literary occupation, two years later he became wholly insane, and he died the next year in an asylum. His collections of short stories include, 'La Maison Tellier' (1881); 'Mlle. Fifi' (1883); 'Les Sœurs Rondoli' (1884); 'Yvette' (1884); 'Contes du Jour et de la Nuit' (1885); 'Contes et Nouvelles' (1885); 'La Horla' (1887); 'La petite Roque' (1888); 'La Main gauche' (1889); 'Le Père Milon'; 'L'inutile Beauté' (1890); etc. The finest of his six nov-

els is 'Pierre et Jean' (1888); the others are: 'Une Vie' (1883); 'Bel Ami' (1885); 'Mont Oriol' (1887); 'Fort comme la Mort' (1889); 'Notre Cœur' (1890). He also published several collections of travel sketches, such as 'Au Soleil' (1884); 'Sur l'Eau' (1888); 'La Vie errante' (1890). A collection of 13 of his short stories published in English with the title 'The Odd Number,' represents him at his best, both in point of art and as regards the stories themselves. The absence of a moral sense is less apparent here than elsewhere and there is less of gloom and animalism perceptible.

Mauptuis, Pierre Louis Moreau de, pê-är loo-ê mö-rô dé mö-për-tü-ê, French mathematician and philosopher: b. St. Malo, France, 28 Sept. 1698; d. Basel, Switzerland, 27 July 1759. He entered the army in 1718 and after five years' service resigned in order to become instructor in mathematics in the Academy of Sciences. He went to England in 1728, where he was made a member of the Royal Society, and became a pupil of Newton. In 1736 he conducted a scientific expedition to Lapland for the purpose of measuring an arc of the meridian, the result of which was a confirmation of Newton's theory of the flattening of the globe at the poles. In 1743 he was elected to the French Academy, in 1744 was summoned to Prussia by Frederick the Great, and in 1746 was declared president of the Academy of Sciences at Berlin. A dispute with the philosopher König regarding the discovery of the infinitesimal calculus shortened his days. Among his works are: 'Sur la Figure de la Terre' (1738); 'Discours sur la Figure des Astres' (1742); 'Maupertiana ou divers Ecrits' (1753). Consult: De la Baumelle, 'Vie de Mauptuis' (1856); Damiron, 'Memoires sur Mauptuis' (1858).

Maurel, mô-rêl, Victor, French singer: b. Marseilles 1848. He was educated at the Paris Conservatoire and made his début in Paris in 1869. His first appearance in Royal Italian Grand Opera was in 1873 and he achieved a signal success. He created Iago in Verdi's 'Otello' and has appeared in many operatic roles in Europe and United States, being generally recognized as the leading acting baritone actor on the Italian stage.

Maurepas, Jean Frédéric, zhôn frâ-dä-rêk mö-rê-pä, Phélypeaux, COMTE DE, French statesman: b. Versailles 9 July 1701; d. there 21 Nov. 1781. He became minister of state under Louis XV. in 1738, but in 1749 was banished the court for an attack on Mme. Pompadour. In 1774 he was made prime-minister by Louis XVI. The chief events of his administration were the restoration of the Parliament of Paris (12 Nov. 1774), and the alliance with and assistance of the American colonies in their struggle against Great Britain. Consult Guyot, 'Eloge Historique de M. de Maurepas' (1782).

Maurice, mâr'is (John), Frederic Denison, English Anglican theologian and author, one of the leaders of the Broad Church movement: b. Normanston, Suffolk, 29 Aug. 1805; d. Cambridge 1 April 1882. He was son of a Unitarian clergyman; was educated at Trinity Hall, Cambridge; settled in London, where he was editor of the 'Athenæum' for several years; and having decided to take holy orders entered Exeter College, Oxford. In 1834 he became curate of Bubbenthal, and two years later chaplain to Guy's

MAURICE OF NASSAU — MAURITIUS

Hospital. He became professor of history in King's College, London, in 1840, and of divinity as well in 1846, but was deprived of both chairs in 1853 because of the liberal tenor of his 'Theological Essays.' Up to 1860 he was chaplain of Lincoln's Inn, and from 1860 to 1869 incumbent of St. Peter's, Vere Street, London. In 1866 he was elected professor of moral philosophy at Cambridge. During his life in London Maurice founded the Working Men's College and Queen's College (for women), took a prominent part in various practical philanthropies, and was a leader of the Christian Socialists. He was a man of wonderfully sweet and beautiful character; a fervent preacher, who made much of the fatherhood of God; and a social reformer, whose lack of success was due to the fact that he was before his time. Among Maurice's works are 'Eustace Conway,' a novel (1834); 'The Epistle to the Hebrews,' 'Warburtonian Lectures' (1846); 'The Religions of the World'; 'Boyle Lectures' (1847); 'The Lord's Prayer,' sermons (1848); 'History of Moral and Metaphysical Philosophy' (1850-60); 'Ecclesiastical History of the First and Second Centuries' (1854); 'The Word "Eternal,"' urging that "eternal punishment" is not "everlasting punishment" (1863); 'Casuistry, Moral Philosophy, and Moral Theology' (1866); 'The Conscience' (1868). Consult the 'Life, chiefly told in his own Letters,' by his son (1884); Rogers, 'Men and Movements in the English Church' (1898).

Maurice of Nassau, Prince of Orange and Count of Nassau: b. Dillenburg, Nassau, 13 Nov. 1567; d. The Hague 23 April 1625. His father, William the Silent, was assassinated in 1584, and the 18-year-old boy was chosen stadtholder by the provinces of Holland and Zealand, and later by the other provinces, the command of the army being entrusted to him in 1587 by the States-General. He captured Breda, Zutphen, and Nimeguen in 1590-1, and by 1597 had wrested the principal towns of the Netherlands from the Spanish. But Ostend was lost in 1604 and in 1609 a truce was made with Spain for 12 years. Internal dissensions followed and Olden Barneveldt, leader of the aristocratic republicans and of the party of religious tolerance, was condemned to death (1619) on the charge of high treason, but actually because of his opposition to Maurice. The stadtholder renewed the war with Spain in 1621, immediately upon the expiration of the truce, and died at the very time he was negotiating an alliance with France and with England. The greatest general of his day he was personally cold and unscrupulous.

Maurice of Saxony, DUKE AND ELECTOR OF SAXONY, German soldier: b. Freiberg 21 March 1521; d. near Sievershausen 11 July 1553. He succeeded his father, Henry the Pious, as duke of Saxony, in 1541; and although a Protestant refused to join the Schmalkald League. In 1548, two years after a secret treaty with the emperor, Maurice was made elector of Saxony. But he soon broke with the emperor, fathoming his purpose of crushing the German princes, and by a sudden show of force made Charles sign the Treaty of Passau 31 July 1552. On the 9th of July in the following year he defeated Albert of Brandenburg-Kulmbach, who had refused to accede to the Treaty of Passau, in the battle of Sievershausen, but died two days later of his wounds. Maurice was the foremost general and

diplomat of his day in Germany, but he was entirely without scruple or principle, and played off one party against another until he was little trusted by either.

Mauricius, mā-rish'ŭ-s, **Flavius Tiberius**, emperor of the East 382-602 A.D.: b. Arabissus, Cappadocia, about 539 A.D.; d. Chalcedon 27 Nov. 602 A.D. He served with distinction against the Persians, and for his abilities and character was made successor to Tiberius II. by that emperor. His reign was filled with wars. He was, however, one of the greatest and best of the Eastern emperors, a patron of the arts and sciences, and himself considerably learned. Phocas, one of his generals, commanding the army operating against the Avars, led a revolt against him, and he fled to Chalcedon, where he was murdered by Phocas' order. He wrote *Στρατηγικά*, a work on military affairs, published in a Latin version by Scheffer at Upsala in 1664.

Maurists, mā-rists, the members of the Congregation of St. Maur, to whom literature owes the stately tomes known as 'Benedictine Editions.' The Congregation had its origin in a reform of the Benedictines in the early part of the 17th century; it was supported by De Retz and afterward by Richelieu, and in 1720 possessed in France six provinces, containing 180 abbeys and priories. Among the most celebrated of the Maurists are Mabillon, Martene, Montfaucon, the founder of the science of archaeology, Ruinart, Lami, Le Nourri, and Martianay. Jansenism seems to have affected some of the convents, and, according to Badiche, a Masonic lodge was established at Glanfeuil in 1755, over which the prior of the monastery in that place presided. The Congregation was suppressed in 1792.

Mauritania, mā-rī-tā'nī-a, or **Mauretania**, Africa, the ancient name of the northwestern portion, corresponding to Morocco and western Algeria. It derived its name from its inhabitants, called by the ancients *Mauri*, a word equivalent to "Blacks." In 40 A.D. it became a Roman province. From 429 to 534 it was held by the Vandals, and in 650 it was conquered by the Arabs. See MOROCCO.

Mauritius, mā-rish'ŭ-s, or **Isle of France**, an island colony of Great Britain, in the Indian Ocean, 500 miles east of Madagascar. It is of an oval form, about 40 miles in length from northeast to southwest, and 25 miles in breadth; area, 705 square miles. There are numerous capes and bays along the shore and the island is surrounded by coral reefs. It is composed chiefly of rugged and irregular mountains, rising into points of considerable height; the highest are the Montagne de la Rivière Noire, 2,730 feet, and the singular isolated rock Peter Botte, 2,700 feet. Between the mountains, and along the coast, there are large and fertile plains and valleys, having a rich soil of black vegetable mold or stiff clay, watered by numerous streamlets, many of which become periodically dry. The climate is pleasant during the cool season, but oppressively hot in summer, and the island is occasionally visited by severe epidemics of fever. The rainy season is from January to April; between December and March the island is subject to hurricanes, occasionally of extraordinary violence. When discovered in 1505 the island was almost entirely covered with wood, the greater part of which has now been cut down, although

MAURITIUS HEMP — MAUSOLEUM

some extensive forests still remain. The fauna then included the dodo, but otherwise was in no way remarkable. Some of the trees are valuable, particularly the black ebony. The indigenous vegetation includes orchids, screw-pines, the traveler's-tree, bamboo, etc. Many plants introduced from Europe, Africa, Madagascar, and India thrive well, and nearly every beautiful tropical tree or delicious fruit is met with. The principal item of cultivation is sugarcane, and to a limited extent rice, maize, manioc, vanilla, coffee, spices, fruits, and tea, the last introduced recently. The value of the exports of unrefined sugar, which is the staple, amounted in 1901 to \$8,792,784. Other exports are rum, vanilla, coconut oil, aloe-fibre, spice. The total value of exports in 1901 was \$9,286,643; of imports, \$6,780,452. The imports consist of rice, wheat, cottons, haberdashery, machinery, etc. The government is vested in a governor, an executive council, and a legislative council, the latter partly elected. The revenue for 1900 was \$3,059,985, and the expenditure \$2,856,315. The chief sources of revenue are the customs, licenses and permits, and the railways; the expenditure is chiefly on the civil service and on the railways, which have a total length of 105 miles. The currency is in rupees and cents. Schools are kept up partly by government, partly by private agencies. The highest institution is the Royal College, a school affiliated to London University. The French language and French law prevail in the colony, and the majority of the white inhabitants are of French origin. Mauritius was discovered in 1505 by the Portuguese. The Dutch took possession of it in 1598, and named it Mauritius in honor of Prince Maurice. It eventually fell into the hands of the French, from whom it was captured by the British in 1810, and it was definitely ceded to them in 1815. Principal towns, Port Louis, the capital, Curepipe, and Mahébourg. Rodrigues, Diego Garcia, the Seychelles, and some other islands of the Indian Ocean are dependencies of Mauritius. The scene of Bernardin de Saint Pierre's celebrated 'Paul et Virginie' is laid in this island. Pop. (1901) 378,195, of whom two thirds were coolies (mainly imported to work the sugar estates).

Mauritius Hemp. See FIBRE.

Mau'rocorda'tos. See MAVROCORDATOS.

Maury, mà'ri, Dabney Herndon, American military officer: b. Fredericksburg, Va., 21 May 1822; d. Peoria, Ill., 11 Jan. 1900. He was graduated from West Point in 1846 and served in the Mexican War. He was brevetted 1st lieutenant in 1847 for "gallant and meritorious conduct" at Cerro Gordo, and served in the United States Military Academy as instructor, 1847-52. At the beginning of the Civil War he was brevetted captain, but resigned to enter the Confederate army, where he attained the rank of department commander of the Army of the Gulf. He again served the United States government when under President Cleveland's first administration he was minister to Colombia. He published 'Skirmish Drill for Mounted Troops' (1859); 'Recollections of a Virginian in the Mexican, Indian and Civil Wars' (1894).

Maury, Matthew Fontaine, American naval officer and hydrographer: b. in Spottsylvania County, Va., 14 Jan. 1806; d. Lexington, Va., 1 Feb. 1873. He studied at the Harpeth

Academy in Tennessee, and entered the United States navy in 1825. During a voyage around the world in the Vincennes he began a treatise on navigation, long used as a text-book in the navy. He was made lieutenant in 1836. In 1839, when he was lamed by an accident, he quitted active sea-service for scientific work at the Naval Observatory. His powers of application were combined with rare gifts of imagination, and an elevated style. His 'Physical Geography of the Sea and Its Meteorology' (1855) has been considered a book of fascinating interest. In 1844 he published his views on the Gulf Stream, ocean currents, and great-circle sailing. His 'Wind and Current Charts' have been of immense benefit to navigation. In 1853 he reached the rank of commander, and in that year projected the maritime conference at Brussels, and also published 'Letters on the Amazon and the Atlantic Slopes of South America.' In 1861, when the Southern States seceded, he gave his services to the Confederate cause. For some time he attached himself to the fortunes of the emperor Maximilian in Mexico; but for the last few years of his life was professor of physics at the Virginia Military Institute. He was among the first to turn fresh attention to a branch of scientific inquiry which had been previously much neglected, the investigation of the depths of the sea, its currents, temperature, etc. Consult Corbin, 'Life of Matthew Fontaine Maury' (1888).

Mauser, Paul, powl mow'zér, German inventor and gun-maker: b. Oberndorf-on-the-Neckar 27 June 1838. He worked as a boy in the royal armory at Oberndorf, and there with his brother Wilhelm (b. 2 May 1834; d. 13 Jan. 1882) patented several improvements on the small arms then in use, both new needle-guns, and a model replacing the "needle" powerful percussion-pin. The introduction of the Prussian needle-gun into Württemberg after the Austro-Prussian war deprived the brothers of the patronage of the government, and in 1867 he settled in Liège. Paul invented the Mauser revolver in 1879, having returned to Oberndorf in 1874. The 'Mauser, 1882' was adopted by the Servian government in 1882. After that date he made the Turkish model in 1887, the Belgian repeating rifle in 1889, the Argentine model in 1891, the Spanish model in 1893 (adopted with slight change throughout South and Central America), and in 1896 a rifle for the Swedish army. The German models of 1898 and 1871-84 are largely due to him. Typical of his rifles are the Belgian model of 1889 and the Argentine of 1891, both magazine rifles with no cut-off, but capable of single fire by replacing the top cartridge in the magazine after each discharge. The magazine holds five cartridges, lies in front of the trigger guard and under the receiver, is fixed in type but easily cleaned. The gun can be charged through the receiver with one cartridge or the five from the magazine may be stripped together from a metal clip, independently of the mechanism of the magazine and pushed to the right on the closing of the bolt. See SMALL ARMS.

Mausole'um (Greek, *mausoleion*), a tomb or burial place, the name of which is derived from Mausolus, a king of Caria, to whom a sumptuous sepulchre was raised by his wife Artemisia, at Halicarnassus. King Mausolus died 353 B.C.;

and his wife was so disconsolate that she perpetuated his memory by the erection of this magnificent monument which became so famous as to be esteemed the seventh wonder of the world, and to give a generic name to all superb sepulchres. Its entire height was 140 feet, and the entire circuit 411 feet. It was overthrown, probably by an earthquake, between the 12th and 15th centuries; and when the knights of Rhodes took possession of Halicarnassus in 1404 they availed themselves of the materials of the mausoleum to erect the fortress of San Pietro. Other famous mausoleums are that erected at Babylon by Alexander the Great in honor of Hephæstion, equally magnificent with that of Mausolus, though less refined; and the mausoleum of Augustus, built by him in the sixth consulate on the Campus Martius, between the Via Flaminia and the Tiber, the ruins of which are still seen near the church of St. Roque. One of the obelisks which stood before this superb building was found in the reign of Pope Sixtus V. This mausoleum contained the ashes of Augustus, Marcellus, Agrippa, Germanicus, and of some later emperors. The mausoleum of Hadrian at Rome is now the Castle of San Angelo.

Mauston, mās'ton, Wis., city, county-seat of Juneau County; on the Lemonweir River, and on the Chicago, Milwaukee & Saint Paul railroad; about 130 miles northwest of Milwaukee. The chief manufacturing establishments are lumber mills, machine shops, and flour mills. Pop. (1900) 1,718.

Mauvaises Terres, mō-vāz tēr. See BAD LANDS.

Mauve, mōv, an aniline purple coloring matter. See DYES.

Maverick, Peter, American engraver: b. New York city 22 Oct. 1780; d. there 7 June 1831. He studied engraving under his father, worked especially on bank-note designs, and made famous engravings of Charles King's portrait of Henry Clay, of Waldo's portrait of Andrew Jackson, and of Dunlap's portrait of Benjamin Moore. Maverick was one of the founders of the National Academy of Design in 1826.

Maverick, an unbranded steer, especially one appropriated by a chance finder. This term, in common use in the cattle country of the United States, is said to be derived from the name of Samuel Maverick, a Texas lawyer and politician, who, having accepted a herd of 400 head of cattle in payment of a debt, left them in charge of one of his men. They were neglected and allowed to run wild, and when the calves were born they were of course appropriated by other ranchers and branded with their marks, and so passed to their undisputable ownership. As the ownership of the cattle was determined by the brand, it may easily be seen why the name 'Maverick's' was given to all calves caught straying from the herd. From this use of the word grew a wider application to anything dishonestly come by.

Ma'vis, the Scottish name for the British songthrush or thrush (q.v.), one of the favorite song-birds of western Europe.

Mavor, James, English political economist: b. Stranraer, Scotland, 8 Dec. 1854. He was graduated from the University of Glasgow. He was for a time editor of the 'Scottish Art

Review'; was university extension lecturer on political economy; in 1888 became professor of political economy at Saint Mungo's College, Glasgow, and in 1892 professor of political economy and constitutional history at the University of Toronto, Canada. He has written: 'Wages Theories and Statistics' (1888); 'Economic Theory and History Tables and Diagrams' (1890); 'Scottish Railway Strike' (1891); 'Currency Reform' (1891); 'Economic Study and Public and Private Charity' (1892); 'English Railway Rate Question' (1894); has edited 'Handbook of Canada' for 1897; and has prepared reports on 'Labor Colonies in Germany' (1893); 'Immigration into Canada from Europe' (1900), and 'Workmen's Compensation Acts' (1900). He has been interested in the currency question and has served as vice-president of the Bimetallic League.

Mavrocordatos, māv'-rō-kōr-dā'tōs, or **Maurocordatos**, Alexander, modern Greek soldier and statesman: b. Constantinople, Turkey, 15 Feb. 1791; d. Ægina 18 Aug. 1865. He was a skilful linguist and early schooled in diplomacy. On the outbreak of the Greek war for independence (1821), he devoted his entire fortune to the equipment of a ship, and the arming of volunteers. He organized the insurrection in Ætolia and Acarnania, was made president of the national assembly at Epidaurus, drew up the provisional constitution, and signed the proclamation of independence (January 1822). He also became president of the executive council, but resigned in what he believed to be the interests of harmony. In 1833-4, 1841-3, 1844, and 1854-6 he was at the head of the cabinet, and in 1850-4 was ambassador at Paris. He promoted public education, and was a Liberal in politics, being of the British party and opposed to the Russian policy of Giovanni and Augustin Capo d'Istria. He is generally considered the most important leader in the Greek Revolution.

Max, māk's, **Gabriel von**, German painter: b. Prague 23 Aug. 1840. The son of a sculptor, with whom he studied for a time, he soon devoted himself to painting, then went to the Prague Academy under Engerth's teaching, and, after several years at Vienna, became a pupil of Piloty in Munich, where he was professor in the Academy from 1879 to 1883. His work is largely fantastic; he aims to interpret music, especially that of Beethoven, Mendelssohn, and Liszt; and is fond of psychic themes, although occasionally, as in his famous pictures of monkeys, going to an extreme of realism, explained by his earnest belief in Darwin and Haeckel. But he is best known for his historical and figure paintings, which usually show a female figure of some beauty and ethereal charm, with dreamy, longing, sentimental eyes. In such pictures as these the flesh tones are particularly remarkable, being sometimes styled marble-like and due to his early training as a sculptor, and again described as a twilight of sentiment, typifying the spiritual. To this class belong 'Spirit Greetings' (1870); 'The Last Token,' now in the Metropolitan Museum, New York (1874); 'Nydia' (1874); 'The Lion's Bride' (1875), and many book illustrations, notably those for Schiller's and for Lenau's poems, for Goethe's 'Faust' (the 'Margarite before the Mater Dolorosa' being es-

MAXENTIUS—MAXIMILIAN

pecially well-known), for Wieland's 'Oberon' and for Uhland's works. Max was ennobled in 1900.

Maxentius, mǎk-sĕn'shĭ-ŭs, **Marcus Aurelius Valerius**, Roman emperor: d. 27 Oct. 312. He was the son of Maximianus, and in 306 A.D., was proclaimed Augustus by the prætorians, and acknowledged by the people and senate of Rome, to whom Galerius had become hateful. Severus, sent by Galerius against him and his father, was compelled by Maximianus to retreat to Ravenna, and was put to death in 307. Galerius was likewise compelled to retreat and Maxentius, availing himself of an insurrection of the Africans under a certain Alexander, in 311, declared war against Constantine the Great. While Constantine pressed forward into Italy, Maxentius himself remained inactive at Rome, and did not go out to meet Constantine till he had passed unopposed across the Apennines. At the great battle fought shortly after, at Saxa Rubra near Rome, Maxentius was defeated, and perished in the Tiber as he tried to escape over the Mulvian Bridge.

Max'im, **Sir Hiram Stevens**, American inventor and engineer: b. Sangersville, Maine, 5 Feb. 1840. He was apprenticed to a carriage-maker in his youth; after several years in a machine-shop in Fitchburg, Mass., where he perfected his knowledge of mechanical engineering and drawing and supplemented his scanty education, he went to Boston as foreman in a factory of philosophical apparatus. From Boston he went to New York as employee of the Novelty Iron Works and Shipbuilding Company; took out patents for an automatic gas machine in 1867, and in 1877 for an incandescent electric light which would burn a month and a half. At about the same time he designed a process for flashing electric carbons and another for "standardizing" them. In 1881-2 he utilized the force of a gun's recoil to reload the gun and fire 770 shots a minute. The Maxim-Nordenfelt Company, combining Maxim's machine-gun patents with those of Nordenfelt, was formed in 1888, and reorganized in 1897 as Vickers Sons and Maxim. Of these two firms Maxim has been the European representative. His other patents are for various smokeless powders and several motors, mostly driven by petroleum. Of late much of his time has been spent in studying aeronautics. He became an English subject because of the alleged unfairness toward him of the United States government, and in 1901 was knighted by Queen Victoria.

Maxim, Hudson, American inventor and engineer: b. Orneville, Maine, 3 Feb. 1853. Received an academic education with especial reference to the natural sciences and engineering, then took up the study of medicine. Entered the printing and subscription book publishing business at Pittsfield, Mass., in 1883, and sold nearly 500,000 copies of a book on penmanship and drawing, of which he was the author. Invented a new chemical ink and a new process of printing in colors. Gave up the publishing business in 1888 to take up the business of ordnance and explosives. He was the first to make smokeless gunpowder in the United States, the first to submit samples for trial to

the United States government, and his was the first to be adopted. In 1890 he built a dynamite factory and smokeless power mill at Maxim, N. J., and it was there that the Maxim-Schupphaus smokeless powder was developed and perfected, made under inventions and patents of his and Dr. Robert C. Schupphaus. These patents were purchased by E. I. du Pont de Nemours & Co. of Wilmington, Del., in 1897. Invented process of making calcium carbide continuously by heat of incandescence of a molten carbide conductor now in general use. In 1901 he sold to the United States government the secret of the high explosive invented by him, known as Maximite. See EXPLOSIVES.

He has invented a detonating fuse for high explosive projectiles. This fuse is incapable of exploding the Maximite charge prematurely, either in handling or transshipment of the projectiles, or in firing them from a gun, while it insures the certain explosion of the projectile after penetration.

Mr. Maxim has recently invented and perfected a new smokeless powder known as "Stabilite," (q.v.) on account of its high stability, and for several years has been conducting experiments on a new automobile torpedo invented by him.

Maximianus I., mǎk-sĭm-ĭ-ā'nŭs, **Marcus Aurelius Valerius**, Roman emperor: d. February 310 A.D. He so approved himself by his services in the army that Diocletian selected him for his colleague, creating him first Cæsar (285), then Augustus (286), and at the same time conferred on him the honorary appellation of Herculus. Maximianus had the care of the Western Empire, while Diocletian undertook that of the Eastern. In 287 he was consul with Diocletian, and in the same year conducted a campaign in Gaul. After conducting several wars, in 303-304 he was for the 7th time made consul, having for his colleague Diocletian for the fifth time, with whom he abdicated 1 May 305. In the following year he was again invested with the imperial title by his son Maxentius, to whom his services against Severus and Galerius were of the most important kind. His son shortly after expelled him from Rome, and repairing to Gaul, in 308 caused himself to be proclaimed Augustus at Marseilles, but Constantine easily deposed him.

Maximilian I., mǎk-sĭ-mĭl'ĭ-an (Ger. mǎks-ĕ-mĕ'lĕ-ān), emperor of Germany: b. Neustadt, near Vienna, 22 March 1459; d. Wels, Upper Austria, 12 Jan. 1519. In 1486 he was elected king of the Romans, and succeeded his father, Frederick III., as emperor in 1493. He first became an independent prince by his marriage with Mary of Burgundy, the daughter of Charles the Bold, who died in 1477. This match involved him in a war with Louis XI., king of France, in which he was successful, though he was defeated at a later period by the Milanese. He was succeeded by his grandson Charles V.

Maximilian, Joseph, 1st king of Bavaria: b. Schwetzingen, Baden, 27 May 1756; d. Nymphenburg, near Munich, 13 Oct. 1825. He succeeded his uncle, Charles Theodore, as elector in 1799. He was a supporter of Napoleon, and gave his daughter in marriage to Eugene Beauharnais in 1806. In the same year his duchy was

MAXIMILIAN — MAXWELL

erected into a kingdom. In 1813, however, he was member of the league against the emperor, and thus retained his throne after the fall of Napoleon. His reign was distinguished by the introduction of many administrative reforms.

Maximilian, emperor of Mexico, known in his earlier life as Ferdinand Maximilian Joseph, Archduke of Austria: b. Vienna 6 July 1832; d. Queretaro, Mexico, 19 June 1867. He was the younger brother of Francis Joseph I., emperor of Austria (q.v.). He entered the Austrian navy in 1846, and in 1854 obtained the rank of rear-admiral, and was placed at the head of the Austrian marine. He was viceroy of the Lombardo-Venetian kingdom in 1857-9, and in 1857 married Princess Charlotte of Belgium, daughter of King Leopold I. On his return from a voyage made to Brazil for scientific purposes he fixed his residence at Miramar in the vicinity of Trieste, and there, 3 Oct. 1863, received a deputation from the Mexican Assembly of Notables, who offered him the crown of their country. He officially announced his acceptance 10 April 1864. He landed at Vera Cruz on 28 May and entered Mexico on 12 June. He set himself energetically to consolidate and develop his dominions, granted an amnesty to political offenders, and exhibited great interest in religious worship and education. But he failed to conciliate the Republican party, and as he did not restore to the clergy their confiscated estates they pronounced him a traitor. Meanwhile there were incessant conflicts between the partisans of President Juarez and the allied French and Imperial troops; and the decree of 2 Oct. 1865, by which the members of the Juarist bands and those who abetted them were to be regarded as bandits and shot, alienated the party of the Liberals. Juarez raised the standard of independence. Complications and misfortunes thickening around Maximilian rendered his position critical in the extreme. The empress in vain undertook a mission to Europe to enlist support for her husband, and grief and disappointment overthrew her reason. The French troops, largely by reason of the representations of the United States government, were withdrawn by Napoleon in March 1867; but Maximilian decided to remain in the hope of being able to maintain the empire. While bravely defending Queretaro against a Liberal force under Escobedo, he was betrayed by General Lopez on the night of 14 May 1867. Tried by court-martial, he was sentenced, with his principal officers, to be shot. The sentence was carried into effect on the morning of 19 July. Maximilian's body was after some delay surrendered to his relatives, and his funeral was celebrated with great pomp in the cathedral of Vienna on 18 Jan. 1868. Maximilian was a man of eminent abilities, and high and varied culture. His collected writings are contained in a posthumous publication entitled 'Aus meinem Leben: Reiseskizzen, Aphorismen, Marinebilder' (1867), which gives ample testimony to the vigor of his intellect and the variety of his attainments. See MEXICO, History.

Maximinus, māk-sī-mī'nūs, **Caius Julius Verus**, Roman emperor: d. Aquileia 238 A.D. He was at first a shepherd in Thrace, and when about 20 years of age became a soldier in the Roman armies, where he was distinguished by

his gigantic stature. His capacity for fighting procured him rapid advancement, and under Alexander Severus he had the command of a legion on the Rhine. In 235 A.D. he took part in a conspiracy against Alexander, and after his murder of the latter by the soldiers was proclaimed emperor. The Gordiani having been proclaimed in Africa, Maximinus hastened to Italy and laid siege to Aquileia. He was there murdered by his soldiers.

Maximite, a high explosive employed as a bursting charge for projectiles, invented by Hudson Maxim (q.v.), of New York city. The secret of the invention, and the exclusive right to the use of the explosive, was purchased by the United States government in 1901, after very exhaustive trials at Sandy Hook proving grounds. Maximite was the first high explosive to be successfully employed as a bursting charge for armor-piercing projectiles. This explosive, while it is claimed to be 50 per cent more powerful than ordinary dynamite, is so insensitive that it will not only safely withstand the shock of discharge from the gun, but will also stand the far greater shock of penetrating armor-plate as thick as the projectile containing it is capable of passing through, the projectile being then exploded immediately behind the plate with a delay action detonating fuse.

Ignited in the open, maximite simply burns like pitch. Projectiles are charged with it by the simple process of melting and pouring, the explosive solidifying on cooling, and adhering firmly to the walls of the shell. Maximite is known to be a picric acid compound.

Maximus Magnus, Roman emperor: b. in Spain; d. 388. In 383, while commanding the Roman army in Britain, he proclaimed himself emperor. Gratian marched against him, but was defeated and assassinated, and Maximus, having made himself master of Gaul, Britain, and Spain, fixed the seat of his empire at Treves. He then advanced into Italy, and was besieged in Aquileia by the Emperor Theodosius, who caused him to be beheaded.

Maxwell, Augustus Emmett, American jurist: b. Elberton, Ga., 21 Sept. 1820; d. Shipley, Fla., 5 May 1903. He was educated in Alabama and in the University of Virginia; settled in Tallahassee, Fla., in 1845; was a member of the State legislature, then secretary of state, and later attorney-general; was elected to Congress in 1853, serving until 1857; and from 1862 to 1865 was a member of the Senate of the Confederate States, of which, with the exception of ex-Senator Vest, he was the last survivor. After the war he was judge of the supreme court of Florida (1866), circuit judge (1877-85), and chief justice of the State (1887-91).

Maxwell, Sir Herbert Eustace, 7TH BARONET OF MONTEITH, Scottish author: b. Edinburgh 8 Jan. 1845. He was educated at Oxford, was junior lord of the treasury 1886-92, and is president of the Society of Antiquaries of Scotland. Among his many publications are: 'Noontide Essays' (1892); 'Scottish Land Names' (1894); 'Rainy Days in a Library' (1896); 'Sixty Years a Queen' (1897); 'Life of the Duke of Wellington' (1899); 'Memoirs of George Romney' (1902); 'The Creevy Papers' (1903).

Maxwell, James Clerk, Scottish natural philosopher: b. Edinburgh 13 Nov. 1831; d. Cambridge, England, 5 Nov. 1879. He was educated at Edinburgh and at Trinity College, Cambridge, and in 1856 was appointed professor of natural philosophy in the Marischal College, Aberdeen, and held that office till its amalgamation with King's College to form the University of Aberdeen in 1860, when he was appointed to a similar chair in King's College, London. In 1857 he obtained the Adams prize at Cambridge for an essay 'On the Stability of Motion of Saturn's Rings.' From 1855 to 1872 he published his investigations on 'Perception of Color, and Color Blindness,' which obtained for him the Rumford medal and his election as F. R. S. He resigned his chair in 1865, and in 1871 was elected unopposed to the newly founded chair of experimental physics at Cambridge. He directed the formation of the Cavendish laboratory founded by the Duke of Devonshire and opened in 1874. In 1871 he published his 'Theory of Heat,' which has gone through several editions. In 1873 appeared his great work, 'Electricity and Magnetism.' Maxwell's fame will rest on his being the one who took the first grand step toward the discovery of the true nature of electrical phenomena. He rejected the theory of electrical 'action at a distance,' and sought to explain all electrical and magnetic phenomena as the results of local strains and motions in a medium whose contiguous parts only act on one another by pressure and tension. His scientific papers have been collected by W. D. Niven (1890). Consult: Campbell and Garrett, 'James Clerk Maxwell' (1882); Glazebrook, 'James Clerk Maxwell and Modern Physics' (1896).

May, Edward Harrison, American artist: b. London, England, 1824; d. Paris, France, 17 May 1887. He came to America when a boy, studied civil engineering, and then devoted himself to painting, working first under Daniel Huntington in New York and then under Couture in Paris. He painted portraits and historical and genre subjects; and his best pictures are the portraits of Laboulaye (1866), in the Union Club, New York, and Anson Burlingame (1869); and 'The Dying Brigand' (1855), now in the Philadelphia Academy of Fine Arts; 'Milton Dictating to his Daughters'; and 'Mary Magdalene at the Sepulchre.'

May, Georgiana Marian Craik, English novelist: b. London, England, April 1831; d. Saint Leonard's, Sussex, 1 Nov. 1895. She was a daughter of G. L. Craik (q.v.) and was married to A. W. May. Her principal novels, which are concerned mainly with domestic life, are: 'Riverstone' (1857); 'Lost and Won' (1859); 'Winifred's Wooing' (1862); 'Mildred' (1868); 'Sylvia's Choice' (1874); 'Hilary's Love Story' (1880); 'Godfrey Helstone' (1884); 'Patience Holt' (1891); 'Dorcas'; 'Only a Butterfly'; 'Anne Warwick.'

May, Phil, English illustrator: b. Leeds 22 April 1864; d. Camden Hill 5 Aug. 1903. He was son of an engineer; had his schooling in Leeds; was apprenticed there to a lawyer, whom he soon left to join a company of players; for them he designed posters; and in 1884 and 1885 began drawing for 'Society' and 'St. Stephen's Review.' After his marriage he went out to

Sydney, Australia, where he gained some fame as artist of the *Bulletin*, and was forced by the exigencies of newspaper illustration to a very scanty use of line and a complete omission of anything else. In 1887 he went to Paris; returned to his work on 'St. Stephen's Review'; then began to draw for 'Graphic,' traveling through America; and shortly after Du Maurier's death was taken on the staff of 'Punch.' He must rank with Leech, Tenniel, and the other great British caricaturists. His art was remarkably simple and telling, his method, it is said, being to reduce an elaborate and detailed drawing to the fewest possible lines. He was particularly happy in his portrayals of London street-life, which are full of humor and sympathy; his Parliament sketches are only less felicitous and the likenesses in them are excellent. His own hatchet face, "banged" hair, and ever-present cigar figure in many of his sketches. From 1892 to his death he published 'Phil May's Annual.' His other collections of drawings are: 'Parson and Painter' (1891); 'Phil May's Sketch Book' (1896), and 'Phil May's Gutter-Snipes' (1896).

May, Samuel, American reformer and Unitarian clergyman: b. Boston, Mass., 11 April 1810; d. Leicester, Mass., 24 Nov. 1899. He was graduated from Harvard in 1829, and from the Harvard Divinity School in 1833. In 1834 he became pastor of the Unitarian Church at Leicester, Mass., but when his strong abolitionist views became unacceptable to his parishioners, he resigned (1846). He was secretary of the Massachusetts Anti-Slavery Society from 1847 to 1865, and secretary of the American Anti-Slavery Society for several years, and was continually active in the abolition movement. After the Civil War he interested himself in many other reforms, and in 1875 was elected to the State legislature. He was a frequent contributor to the 'Liberator' and 'Anti-Slavery Standard'; and published 'The Fugitive Slave Law and its Victims.'

May, Samuel Joseph, American Unitarian clergyman and reformer: b. Boston, Mass., 12 Sept. 1797; d. Syracuse, N. Y., 1 July 1871. He was graduated from Harvard in 1817, studied for the ministry at Cambridge, was ordained at Boston to the Unitarian ministry 14 March 1822, and was pastor of churches at Brooklyn, Conn., 1822-36, South Scituate, Mass., 1836-42, and Syracuse, N. Y., 1845-67. In 1842-4 he was principal of the girls' normal school at Lexington, Mass., and in 1867-71 did missionary work in Central New York for the American Unitarian Association. As early as 1826 he was known as a preacher and writer against slavery, and for his advocacy of immediate emancipation was burned in effigy at Syracuse in 1830. In 1833 he was one of the organizers of the National Anti-Slavery Society, and was a signer of Garrison's 'Declaration of Sentiments.' From 1835 to 1853 he was general agent of the Massachusetts Anti-Slavery Society, and in connection with this post traveled extensively and spoke frequently. His life, like that of many another abolitionist, was often in danger, and he was repeatedly mobbed. He was among the more conservative anti-slavery leaders in his methods, and was prominent also in charity and education. His 'Recollections of the Anti-Slavery Conflict' (1868) is a highly valuable

work. Consult Mumford, 'Memoir of S. J. May' (1873).

May, Thomas, English dramatist and historian: b. Mayfield, Sussex, 1594; d. London 13 Nov. 1650. He was educated at Cambridge, became a member of Gray's Inn and figured brilliantly at court. He published: 'Antigone,' 'Cleopatra,' 'Agrippina,' and other dramas and translations of the 'Georgics' and Lucan's 'Pharsalia.' He espoused the cause of Parliament in the Civil War, was made secretary and historiographer to Parliament, and wrote 'History of the Parliament of England, 1640-3' (1650; several times republished), and a 'Breviary' of the same history (1650).

May, Thomas Erskine, BARON FARNBOROUGH, English historian: b. London 8 Feb. 1815; d. Westminster 17 May 1886. He was educated at Bedford grammar-school, became assistant librarian to the House of Commons in 1831, and was called to the bar in 1838. He was appointed examiner of petitions for private bills in 1846, and clerk to the House of Commons in 1871. He was knighted in 1866, and just prior to his retirement from office in 1886, was raised to the peerage. He is best known as an antiquarian and historian. His chief works are: 'A Practical Treatise on the Law, Privileges, Proceedings, and Usages of Parliament' (1844; 10th ed., much enlarged, 1893); 'Constitutional History of England since the Accession of George III., 1760-1860 (1861-3; republished with supplementary chapter, 1871); 'Democracy in Europe: a History' (1877). In 1854 he collected and reduced to writing the 'Rules, Orders, and Forms of Procedure of the House of Commons.'

May, the 5th month of the year, having 31 days. It was 2d in the old Alban calendar, 3d in that of Romulus, and 5th in that of Numa Pompilius. The etymology of the word is doubtful. It was called *Maius* by Romulus, in respect to the senators and nobles of his city, who were called *Majores*, as the month following was called *Junius*, in honor of the youth of Rome who served him in war and were named *Juniores*. Some etymologists are of opinion that it was called *Maia*, from the goddess of that name, the mother of Mercury, to whom they offered sacrifices on the first day of the month. The sun enters Gemini during May, and the plants of the earth generally begin to flower. See CALENDAR.

May Apple. See MANDRAKE.

May Beetle, or June Bug, popular names for the clumsy brown beetles of the genus *Lachnosterna* (family *Scarabæidae*) common throughout the United States. The adults fly by night during late spring and often are troublesome upon the young foliage of trees and shrubs. They are attracted by light and may be trapped in this way. The larvae are large, brown-headed, white-bodied grubs which feed upon the roots of grass, etc., passing one or more years in the ground. For this reason strawberries and other crops which they attack should not be planted upon freshly turned sod land. Late fall plowing is often practised to destroy them.

May-bird, a gunner's name for various shore-birds which return from the South in the month of May, especially the Knot (q.v.). In New England the black-bellied plover, and in the South a curlew, are called May-birds or May-cocks.

May Cherry, a local name for the service-berry bush. See AMELANCHIER.

May-fly, Shad-fly, or Day-fly, members of the order *Ephemeroidea*. The species, of which about 300 have been described, nearly one third of which are North American, are fragile insects with large fore-wings, small or wanting hind-wings, short antennæ, atrophied mouth parts, and two or three thread-like abdominal filaments. Being greatly attracted to lights, the adults are often a source of annoyance in lake-side and river-side towns, and are sometimes especially troublesome in obscuring the lights from light-houses. The eggs are laid in fresh water either upon the surface or upon the bottom, the female diving for this purpose. The larvæ, which feed mainly upon vegetable matter, are active creatures with strong legs, abdominal tracheal gills and anal appendages. They live upon the bottom, under stones, covered with mud, or in burrows. After moulting about ten times wing pads appear, and these increase with each moult until the last, which may be number twenty. This occurs in the open air, the one previous to which occurs at the surface of the water, the insect escaping from its sub-imaginal skin rather suddenly. One striking difference the adults exhibit is the development of paired sexual organs, which do not appear in other orders of insects. The larvæ may take three years to develop; the adults live only a few days, lay their eggs and die. Both adults and larvæ are important food for fishes, and consequently they form a favorite bait with anglers, and are imitated in making artificial flies.

Maya (mā'a or mā'yā) **Indians**, the aboriginal race or people of Yucatan (q.v.). At one time they were the most advanced of American Indian races, but the descendants of the race today are sadly degenerated. The Mayas of ancient days had a written language and left numerous examples of MSS., letters and picture writing. They made wooden covers for their books, and manufactured paper from leaves or vegetable fibre, joined edge to edge and folded like a fan. Over the whole page were pictures painted in all sorts of colors, which was their way of writing.

The Mayas and Aztecs (q.v.) had much in common. Their religions were related; both adored many of the same deities—especially the sun. Both worshipped idols carved from stone, and both sometimes sacrificed human victims. Among the Mayas there may have been a greater tendency toward a monarchical government than among the Aztecs; but here, too, an elected council was the real power. In method of warfare the two people were much alike, but the Mayas, though brave, were not so warlike as the Aztecs and paid more attention to agriculture and the arts. The people lived well, dressed in cotton of their own raising and weaving, made many ornaments of gold and greenstone, and were expert feather-workers. They surpass all American tribes in their architecture and in their carving in stone. Though without iron tools, they were able to erect fine buildings of stone, carved with remarkable and beautiful designs. In the wild forests of Yucatan and Central America, in the midst of dense tropical woods, overgrown with trees and tangled vines, are the deserted ruins of upward of 40 ancient towns. These different towns were connected by paved roads

of stone, over which couriers ran, carrying letters, along which traders bartered and dickered, and on which the forces of one town would often march out to capture and sack some other town. In many cases the buildings were set upon a great flat-topped mound, with sloping sides and rectangular base and summit. These buildings were sometimes constructed around the sides of a square court, the doors all opening into the court. Such buildings were doubtless the houses in which dwelt many families, as in the pueblo houses in New Mexico. There are also temples for purposes of worship. In such there is usually found a tablet in the wall and an altar for sacrifice. The interior decoration of rooms was often elaborate, the walls being covered with stucco, on which were painted in brilliant colors paintings which furnish us much information of the dress, manners, gods, and worship of the people. Often these designs are in low relief. One of the most famous Mayan works of art is in the temple at Palenque, where is a remarkable tablet on which is represented a sacrificial scene. Copan is a most interesting Mayan town.

Mayaguez, mā-yā-gwas', Porto Rico, a seaport city on the Mayaguez River near the west coast, the capital of Mayaguez Department, 72 miles southwest of San Juan. The city was founded in 1752 and has a modern appearance, with wide streets, fine buildings, electric lights and a street railway. It has a large but shallow harbor, and its port is three miles distant at Mayaguez Playa, where a considerable export trade in coffee and oranges is carried on. Pop. (1899) 15,187.

Maybrick, Michael ("STEPHEN ADAMS"), English composer: b. Liverpool about 1845. He studied music in Italy and Germany, and was for many years a leading baritone vocalist in concerts and English opera. As a writer of songs over the signature "Stephen Adams," he has been widely popular in this country and England. Among the best known of his many songs are: 'Nancy Lee'; 'Alsatian Mountains'; 'The Holy City'; 'A Warrior Bold.'

Mayence, mā-yōns. See MAINZ.

Mayer, mā'ér, Alfred Marshall, American physicist: b. Baltimore 13 Nov. 1836; d. Maplewood, N. J., 13 July 1897. He studied at St. Mary's College, Baltimore; spent two years in a machine-shop and draughting-room; specialized in chemistry and physics; became professor of these branches in the University of Maryland (1856), and in Westminster College, Fulton, Mo. (1859); after two years of study in Paris, was appointed to a chair in Pennsylvania College, Gettysburg (1865); went thence to Lehigh University in 1867; and from 1871 to his death was professor of physics in Stevens Institute, Hoboken, N. J. There he made important researches in acoustics; invented the topophone, an apparatus to detect the phases of sound vibration; discovered five methods of analysis of compound sounds into their elementary tones; and stated the law of tuning-fork vibration. He wrote many papers for the 'American Journal of Science,' notably a series entitled 'Researches in Acoustics'; several contributions to the 'Scientific American Supplement'; 'Lecture Notes on Physics' (1868); 'The Earth a Great Magnet' (1872); 'Light' (1877); and 'Sound' (1878).

Mayer, Brantz, American author: b. Baltimore 27 Sept. 1809; d. there 21 March 1879. He was educated at St. Mary's College, Baltimore, studied law by himself during an Oriental voyage in 1827-8 and then at the University of Maryland; was admitted to the bar in 1829; and after a year in Mexico as secretary of legation wrote 'Mexico as it Was, and as it Is' (1844). In the same year he founded the Maryland Historical Society. In the Civil War he sympathized with the Union, was president of the Union State General Committee, and from 1863 to 1871 paymaster in the U. S. army. His best book was 'Captain Canot'; a story of the slave trade founded on fact. He also wrote 'Mexico, Aztec, Spanish, and Republican' (1851); 'Mexican Antiquities' (1858); 'Memoir of Jared Sparks' (1867), and 'Baltimore as it Was, and as it Is' (1871).

Mayer, Constant, American artist: b. Besançon, France, 4 Oct. 1852. A student at the School of Fine Arts in Paris, he left his studies in 1857 and settled in New York, where his sketches and portraits won immediate success. His portraits of Grant and Sherman and his life-sized genre paintings, such as 'Maud Müller'; 'The Song of the Shirt'; 'Evangeline,' gained much popularity. Since 1866 he has been an associate of the National Academy of Design.

Mayer, Frank Blackwell, American artist, brother of Albrothal Mayer (q.v.) and nephew of Brantz Mayer (q.v.): b. Baltimore 27 Dec. 1827. He studied art there under A. J. Müller, and under Gleyre and Brion in Paris and then settled in Annapolis. He made a special study of Dakota Indian types; contributed to 'Harper's' and 'Century' various articles with his own illustrations; and exhibited in the Paris Salon and at the Centennial Exhibition of 1876, where he received a medal for two pictures, 'The Continentals' and 'Attic Philosopher.' Among his other canvases are 'Feast of Mondawmin'; 'The King's Fool'; 'The Trappist'; 'Maryland in 1750'; 'Crowning a Troubadour,' and 'The Treaty of Traverse des Sioux.'

Mayer, Henry, American caricaturist: b. Worms, Germany, 18 July 1868. Educated in Germany and England, he at first followed a business career in the latter country, but emigrating to the United States in 1887, soon won for himself a distinct place as caricaturist, by his designs and illustrations for American and European papers. Since 1893 he has resided in New York. His works are: 'Autobiography of a Monkey' (1896); 'In Laughland' (1899); 'Fantasies on Ha-Ha' (1899); 'A Trip to Toyland.'

Mayer, mi'ér, Julius Robert von, German physicist: b. Heilbronn, Württemberg, 25 Nov. 1814; d. there 20 March 1878. He was educated at the gymnasium in Heilbronn, studied medicine at Tübingen, and finished his university studies at Munich and Paris. In 1840 he went to Java as a ship's surgeon, and while there turned his attention to studies of the blood, extending his work to exhaustive investigations of animal heat, to which he applied the mechanical theory. Returning in 1841 to Heilbronn, where for some years he practised his profession, he became deeply engrossed with his scientific labors, and in 1842 published in Liebig's 'Annalen der Chemie und Pharmacie' a preliminary statement of his revolutionary theory of heat, together with his views on the conservation and

MAYFAIR—MAYHEW

correlation of energy. Three years later he re-stated his results, at the same time giving a forecast of his theory of the meteoric origin of the sun's heat. Contemporaneously with Mayer the mechanical theory of heat was worked out independently by J. P. Joule (q.v.) in England, and a controversy arose regarding the priority of discovery. The Royal Society gave Mayer the Copley medal in 1871, and two years before his death he was ennobled by the king of Württemberg. His collected works appeared in 1867 under the title of 'Die Mechanik der Wärme.' Consult Weyrauch, 'Robert Mayer' (1890), and Gross, 'Robert Mayer and Hermann von Helmholtz' (1898).

Mayfair, London, England, a fashionable neighborhood in the "West End" adjoining Belgravia. See LONDON.

Mayfield, Ky., city, county-seat of Graves County; on the Illinois Central railroad; about 30 miles from the Mississippi River and 25 miles from the Ohio at the mouth of the Tennessee. It was settled about 1820 and incorporated in 1850. It is in a fertile agricultural region in which the chief product is tobacco. Mayfield has large tobacco warehouses and factories, clothing factories, woolen mills, fire-clay works, flour and lumber mills. It has an extensive trade in tobacco. The mayor is elected once in four years; the council acts upon the appointments of the executive. Pop. (1890) 2,909; (1900) 4,081.

Mayflower, The, the name of the vessel in which the Pilgrim Fathers, or first colonists in New England, sailed to this country in 1620. The Mayflower was a vessel of 180 tons. She set sail from Southampton, England, on 5 Aug. 1620, in company with her sister ship, the Speedwell, but the courage of the captain and the crew of the latter vessel failing, both ships put back to port. Finally on 6 September the Mayflower again spread her sails from Plymouth, having on board as passengers 41 men and their families, 102 persons in all. They succeeded in crossing the Atlantic, after a stormy voyage of 63 days. They intended to go to the mouth of the Hudson River but the captain of the Mayflower took them to Cape Cod. They landed at Plymouth, Mass., at a point where Plymouth Rock (q.v.), a huge granite boulder, stands at the water's edge. A complete and authentic list of the male passengers who landed from the Mayflower is as follows:

THE MAYFLOWER PASSENGERS.

Allerton, Isaac	Hopkins, Stephen
Allerton, John	Howland, John
Billington, John	Leister, Edward
Bradford, Wm.	Margeson, Edward
Brewster, Wm.	Martin, Christopher
Brittnerage, Richard	Mullins, William
Brown, Peter	Priest, Degony
Carver, John	Rigdale, John
Chilton, James	Rogers, Thomas
Clarke, Richard	Soule, George
Cook, Francis	Standish, Miles
Crackston, John	Tilly, Edward
Dotey, Edward	Tilly, John
Eaton, Francis	Tinker, Thomas
English, Thos.	Turner, John
Fletcher, Moses	Warren, Richard
Fuller, Edward	White, William
Fuller, Samuel	Williams, Thomas
Gardiner, Richard	Winslow, Edward
Goodman, John	Winslow, Gilbert

With these 41 male passengers and heads of families came 15 male servants, whose names were as follows:

SERVANTS ON THE MAYFLOWER.

Carter,	Langmore,	Sampson,
Coper,	Latham,	Story,
Ely,	Minter,	Thompson,
Holbeck,	Moore,	Trevore,
Hooke,	Prower,	Wilder.

The following is a copy of the covenant agreed upon by these first settlers of Massachusetts, signed and subscribed on board the Mayflower at Cape Cod, 11 Nov. 1620, two days after the ship came to anchor:

THE MAYFLOWER COMPACT.

In the name of God Amen! We whose names are under-written, the loyal subjects of our dread sovereign Lord, King James, by the grace of God, of Great Britain, France and Ireland, King, Defender of the Faith, etc., have undertaken for the glory of God and the advancement of the Christian faith, and honor of our King and Country, a voyage to plant the first colony in the northern parts of Virginia; do by these presents, solemnly and mutually, in the presence of God and of one another covenant and combine ourselves together into a civil body politic for our better ordering and preservation, and furthermore of the ends aforesaid; and by virtue hereof to enact, constitute and frame just and equal laws, ordinances, acts, constitutions, and offices from time to time, as shall be thought most mete and convenient for the general good of the colony; unto which we promise all due submission and obedience. In witness whereof we have hereunto subscribed our names, at Cape Cod, the 11th of November, in the year of the reign of our sovereign Lord, King James of England, France and Ireland, the Eighteenth, and of Scotland the Fifty-fourth, Anno Domini 1620.

Whittier, Lowell, Holmes, and other poets have immortalized the Mayflower in well known poems.

Mayflower Descendants, Society of, an American patriotic society founded in New York city 22 Dec. 1894. Its membership is confined to lineal descendants of any passengers on the Mayflower, the voyage of which terminated at Plymouth Rock, Mass., in November 1620. There are also numerous State societies of a similar character. In 1901 there were over 2,000 members of the society.

Mayflower. See ARBUTUS, TRAILING.

Mayhem, in law, the maiming of one person by another, the destroying or disabling of an arm, leg, hand, or foot, putting out an eye, etc. Mayhem renders the perpetrator liable to a civil action for damages, and also to a criminal prosecution.

Mayhew, mā'hū, **Experience**, American missionary: b. Martha's Vineyard, Mass., 27 Jan. 1673; d. there 29 Nov. 1758. He took charge of a half-dozen congregations of Indians, and in 1709 executed for the Society for the Propagation of the Gospel in New England a translation of the Psalms and of the Gospel according to St. John into the Indian tongue. His principal writing is 'Indian Converts' (1727), containing accounts of 30 Indian ministers and 80 other Indian Christians.

Mayhew, Henry, English journalist and author: b. London 25 Nov. 1812; a. 25 July 1887. In 1831 he started, with Gilbert A. Beckett, a periodical called 'Figaro in London'; in 1841 produced, with A. Beckett, the farce of the 'Wandering Minstrel'; and not long after formed a literary partnership with his brother Augustus, the "Brothers Mayhew," as they came to be familiarly known, turning out a number of most successful works of amusing fiction. Among these may be mentioned: 'The Greatest Plague of Life, or the Adventures of a Lady in Search of a Good Servant' (1847); 'The

From the Painting by Halsell, now in Plymouth Hall.

THE MAYFLOWER IN PLYMOUTH HARBOR.

Image of His Father, or One Boy is More Trouble than a Dozen Girls' (1850); 'Living for Appearances' (1855). In 1851 appeared the first volume of his most important work, 'London Labor and the London Poor.' He was one of the founders of 'Punch' (1841) and its first editor. Other works of his are: 'The Wonders of Science, or Young Humphry Davy'; 'Young Benjamin Franklin'; 'The Boyhood of Martin Luther'; 'German Life and Manners, as Seen in Saxony at the Present Day'; 'The Criminal Prisons of London and Scenes of Prison Life' with Binny. His brothers Horace, Thomas, and Edward also assisted Henry and Augustus in their enterprises, beside publishing independently.

Mayhew, Jonathan, American clergyman: b. Martha's Vineyard, Mass., 8 Oct. 1720; d. Boston 9 July 1766. He was graduated from Harvard in 1744, and from 1747 until his death was minister of the West Church in Boston. In a day of theological controversy, he was prominent for his tracts. His views were so liberal as to exclude him from the Boston Association of Congregational Ministers. He opposed the measures of the British society for the propagation of the Gospel in foreign parts, and got into a dispute about it with Secker, archbishop of Canterbury. In both pulpit and press he was an earnest patriot, being of much assistance to Otis and other early leaders. Among his writings are: 'Seven Sermons' (1749); 'Discourse concerning Unlimited Submission and Non-resistance to the Higher Powers' (1750); and 'Sermons' (1756). Consult: 'The Memoir' by Bradford (1838); Tyler, 'History of American Literature.'

Mayhew, Thomas, American colonial governor: b. England 1592; d. Martha's Vineyard, Mass., March 1682. Prior to his emigration to New England he had been a merchant in Southampton. He settled first at Watertown, Mass., and in 1641 secured from the agent of Lord Stirling a grant of the larger part of the island of Martha's Vineyard and the title of governor. With his son Thomas he labored to convert the Indians of the island, so successfully that during King Philip's War the island Indians protected the white settlers. He founded Edgartown in 1647, and after the death of his son and grandson continued their ministry and organized an Indian church.

Maynard, mā'nard, Charles Johnson, American naturalist: b. West Newton, Mass., 6 May 1845. He had a common school education, worked on a farm, and devoted himself to natural history as a boy. He is well known as an ornithologist, discovered the bittern's vocal organs, and in 1875 was elected vice-president of the Nuttall Ornithological Club, in connection with which he founded and edited 'The Nuttall Bulletin.' As a conchologist he studied the genus *Cerion* of West Indian shells. He also made important additions to the knowledge of American butterflies. Maynard wrote: 'Naturalists' Guide'; 'Butterflies of New England'; 'Eggs of North American Birds'; 'Contributions to Science'; 'Manual of North American Butterflies'; 'Sparrows and Finches of New England'; 'Sponges'; 'Warblers of New England'; 'The Genus *Strophia*'; and 'Manual of Taxidermy.'

Maynard, Edward, American inventor: b. Madison, N. J., 26 April 1813; d. Washington, D. C., 4 May 1891. He entered West Point in 1831; resigned because of ill-health in 1832; studied dentistry; and practised in Washington from 1836 to 1890. He invented new dental tools; discovered in 1846 the diversity of the maxillary antra; introduced the method of filling cavities with gold foil; taught dentistry in the Baltimore College of Dental Surgery and in the National University at Washington; and practised successfully in Europe. His great fame was due to his invention of small arms and new priming methods which superseded percussion caps. He patented a breech-loading rifle in 1851; a method of converting muzzle-loaders to breech-loaders in 1860; a plan to join two barrels so that contraction and expansion in either would be independent of the other, in 1868; and in 1886 a registering device showing the number of cartridges in a magazine rifle. His rifle was adopted by the United States, and brought him decorations from the governments of Belgium, Prussia, and Sweden.

Maynard, George Willoughby, American artist, son of Edward Maynard (q.v.): b. Washington, D. C., 5 March 1843. He studied art in the Royal Academy of Antwerp; worked in Paris in 1878; then returned to America, where he received a medal from the Pennsylvania Academy of Fine Arts in 1884, and was elected to the National Academy in 1885. He was president of the Salmagundi Sketch Club and of the American Black-and-White Society. Besides his portraits, Maynard's most important canvases are: 'Vespers at Antwerp'; '1776'; 'Water Carriers of Venice'; 'A Musician'; 'Bachelor's Breakfast'; 'Ancient Mariner'; 'Old and Rare'; 'Strange Gods'; and 'Grandfatherly Advice.'

Maynard, Horace, American politician: b. Westboro, Mass., 30 Aug. 1815; d. Knoxville, Tenn., 3 May 1882. He was graduated from Amherst College in 1838; and became instructor, and later professor, in East Tennessee College, Knoxville, Tenn. He studied law, was admitted to the bar in 1844, and built up a successful practice. In 1857 he was nominated for member of Congress by the Know-Nothing party, and elected. On the outbreak of the Civil War he declared his loyalty to the Union and took an active part in the unsuccessful attempt to keep Tennessee from seceding; on this account he suffered persecution and heavy loss of property during the War. In 1866-75 he was again member of Congress, being representative-at-large for his State in the last two years. In 1875 he was appointed minister to Turkey, and, in 1880 postmaster-general in President Hayes' cabinet, holding the office till 4 March 1881.

Maynooth, mā-nooth', Ireland, a market-town of County Kildare, 13 miles by rail north-west of Dublin. Its modern celebrity is derived from the well-known Roman Catholic college of Saint Patrick (q.v.). Maynooth is of historic interest as the seat of the powerful Geraldines, and has ruins of their castle, built 1176 and enlarged in 1426. Several battles with the English occurred here, including the rebellion of Silken Thomas in the reign of Henry VIII., and the war of the Confederates (1641-50). Pop. under 1,000.

Maynooth College. See SAINT PATRICK'S COLLEGE.

Mayo, mā'ō, Amory Dwight, American Unitarian clergyman and educator: b. Warwick, Franklin County, Mass., 31 Jan. 1823; d. 8 April 1907. He was graduated from Amherst, and taught in the public schools in Massachusetts 1839-44. In 1846 he became the minister of the Universalist Church at Gloucester, Mass., and later held Universalist pastorates at Cleveland, Ohio (1854-6), and at Albany, N. Y. (1856-63). He then entered the Unitarian ministry, and was pastor at Cincinnati, Ohio (1863-72), and at Springfield, Mass. (1872-80). He was long prominent as an educator, was an efficient and active member of the boards of education, in Cincinnati and Springfield, and was connected with the Meadville (Pa.) Theological School as lecturer and professor from 1868-98. After 1880 he devoted his attention chiefly to the advancement of education in the South, lecturing frequently in many different States. He was the chief editorial writer for the 'New England and National Journal of Education,' and published 'The Moral Argument for Universalism'; 'Graces and Powers of the Christian Life' (1852); 'Biography and Collected Writings of Mrs. S. C. E. Mayo'; 'Symbols of the Capitol, of Civilization in New York' (1859); 'Talks with Teachers' (1885); 'Southern Women in the Recent Educational Movement in the South' (1892); and 'History of the American Common School.'

Mayo, Frank, American actor: b. Boston 19 April 1839; d. 8 June 1896. His first appearance on the stage was at the American Theatre in San Francisco, and he was for several years the leading actor on the Pacific coast. In August 1865 he appeared in Boston as Badger in 'The Streets of New York' with great success, and though he played Shakespearian and other roles acceptably, became best known in his character of Davy Crockett, first played by him in Rochester, N. Y., in 1872, and thereafter almost exclusively by him till 1884. In later years he played in his own drama of 'Nordeck' and in a stage version of 'Pudd'nhead Wilson.'

Mayo, Isabella Fyvie, "EDWARD GARRETT," English novelist: b. London 10 Dec. 1843. She is of Scottish parentage, and was married to J. R. Mayo, a solicitor, in 1870. Since his death, in 1877, she has resided in Aberdeen. Among her works are: 'Occupations of a Retired Life' (1868); 'Friends and Acquaintances' (2d ed. 1872); 'By Still Waters' (new ed. 1886); 'The Capel Girls' (new ed. 1877); 'The House by the Works' (new ed. 1881); 'Equal to the Occasion' (1887); 'A Daughter of the Klephts' (1897); 'Chrystal Joyce' (1899). Her stories, many of which are semi-religious in cast, have been much read in this country.

Mayo, mī'ō, a tribe of Mexican Indians of the Pinan family, located on the banks of the Mayo River in southern Sonora. Their allies and northern neighbors are the Yaquis (q.v.), and their habits and language are almost identical. They are a peaceful, agricultural people and are thoroughly Mexicanized. They number perhaps 6,000.

Mayo-Smith, mā'ō-smīth', Richmond, American political economist: b. Troy, Ohio, 9

Feb. 1854; d. New York city 11 Nov. 1901. He was graduated from Amherst College in 1875, and studied in Germany for two years. From 1877 he was connected with Columbia University, first as assistant in history and political science, then as adjunct professor (1878-83), and professor of political economy and social science (1883-1901). He was also one of the faculty of the graduate School of Political Science, established in 1880, and his chief work as teacher was done in this school. His specialty was statistics, on which he was a recognized authority. He was an honorary fellow of the Royal Statistical Society of Great Britain, a member of the International Statistical Institution and of the American Statistical Association, being vice-president of the latter; he was also a member of the National Academy of Science, and of the American Economic Association, of which he was one of the founders. He was editor of the 'Political Science Quarterly' from 1886, and published 'Emigration and Immigration' (1890); 'Statistics and Sociology' (1895); and 'Statistics and Economics' (1899).

Mayon, mā-yōn', a volcano of the Philippines situated in the northern part of the province of Albay, Luzon, height 8,274 feet. It rises from a broad plain about six miles from Albay Gulf, and forms a perfect cone; its summit is surrounded by vapor, which at night has a fiery glow. Its sides, almost to the top, are covered with grass or moss, and the ascent though it has been made, is difficult. Near the summit there are fissures which emit sulphurous gases and steam, and there were several eruptions during the 19th century, the town of Cagsaua at the foot of the mountain being entirely destroyed in 1814.

Mayonnaise, mā-ōn-āz', a thick cold dressing for salads, cold meat, poultry, fish, vegetables, etc., made of the yolks of eggs, salad oil, and vinegar, with a little salt and pepper; it is sometimes colored red with powdered lobster shell, or green with spinach or parsley.

Mayor des Planches, mā'yōr dā plānch'āz, Edmondo, Italian ambassador to the United States: b. 27 July 1851. He was graduated from the University of Turin in 1874 and entered the diplomatic service the next year. He was secretary to the prime minister Depretis 1876-8, and was Crispi's chief of cabinet 1887-1901. He was minister at Belgrade 1898-1901 and since the last named date has been ambassador to this country. He has published 'La Signora di Kruedner' (1881); 'Crispi chez Bismarck' (1894); 'Nuove Lettere del Conte di Cavour' (1895); etc.

Mayor. See MUNICIPAL GOVERNMENT.

Mayotta, mā-yōt'tā, or Mayotte, mā-yōt'. See COMORO ISLANDS.

Mayow, mā'ō, or Mayo, John, English physiologist and chemist, the first to attack the theory of phlogiston: b. London May 1643; d. there October 1679. He was of a Cornish family; entered Wadham College, Oxford, in 1658; became a scholar there in 1659; and was elected a fellow of All Souls in 1660. He was graduated in 1665; studied medicine; practised in Bath; and in 1678 was elected to the Royal Society. His Latin tract on the Respiration appeared in 1668; it urged that the heart was

a mere muscle, that breathing is simply to give the nitroaerian constituent (oxygen) to the blood, and that this constituent is necessary to life. In 1674 he published 'Tractatus Quinque,' summarizing and completing his theory; in this work he showed that "fire-air," "nitre air" or "aerial spirit," as he styled oxygen, is contained in all acids and is necessary to combustion and respiration, which are therefore analogous.

Mayoyaos, mā-yō-yā'ō, a native tribe of the island of Luzon, Philippines, living in the southwestern part of the province of Isabela and in the northwestern angle of the province of Nueva Vizcaya. They are a head-hunting tribe of Malay race; and of the Ifugao linguistic stock.

Maysville, mǎz'vīl, Ky., city, county-seat of Mason County; on the Ohio River, and on the Louisville & N. and the Chesapeake & O. R.R.'s; about 63 miles southeast of Cincinnati. The first settlement was made about 1782, and in 1787 it was incorporated by the legislature of Virginia. In 1833 it was granted a city charter. It is in a rich agricultural region, and its facilities for transportation give it considerable commercial importance. Its chief manufacturing establishments are flour and lumber mills, foundries, distilleries, cotton mills, plow and pulley works, boot and shoe factories, tobacco, and furniture. Some of the prominent buildings are the Masonic Temple, the Odd Fellows' Temple, and the Maysville and Mason County Public Library. The library organization was established in 1878. The government of the city is vested in a mayor, who holds office four years, and a council. Pop. (1890) 5,358; (1900) 6,423.

Mazarin, mǎz'a-rīn (Fr. mā-zā-rān), **Jules**, or **Giulio Mazarini**, mǎd-zār-ē'nē, French cardinal and minister of Louis XIV.: b. Piscina, in the Abruzzi, Italy, 14 July 1602; d. Vincennes, 9 March 1661. He was educated at Rome by the Jesuits, thence proceeded to the University of Alcalá in Spain; entered the pope's military service, and distinguished himself by diplomatic ability, for which he was rewarded with two canonries, and the appointment of nuncio to the court of France (1634-6). Here he gained the favor of Richelieu; accepted service from the king, and became a naturalized citizen of France; was made a cardinal in recognition of his diplomatic services in Savoy; and in 1642, when Richelieu died, promptly succeeded him. On the death of Louis XIII. the queen, Anne of Austria, became regent for her young son, Louis XIV., and it was thought that Mazarin would be dismissed; but instead he gained over the queen-regent, and made himself master of the nation. Two parties in the state rebelled against this usurpation of supreme power by the cardinal. The Parliament of Paris denounced his increasing taxation, while the nobility dreaded his supremacy, and the combination of these malcontents resulted in the civil war of the Fronde (q.v.). As the immediate result of the conflict, Mazarin had twice to leave the court, but through means of intrigue formed a powerful royal party in the state, gained General Turenne to his cause, and finally returned to his position at court in 1653. During the succeeding eight years he remained all-powerful in France; pursued the policy of Richelieu in foreign affairs; made an alliance with Cromwell; brought the Rhine provinces

under the headship of France, and in the treaty of the Pyrenees humiliated Spain, and gained much of French Flanders. In proportion as his foreign policy was successful, his home policy was disastrous. He did nothing for the people but increase their taxes to fill an impoverished exchequer, though he secured the supremacy of the crown over the feudal lords. Consult: Chéruel, 'France sous le Ministère de Mazarin' (1881-2); Mason, 'Mazarin' (1886); Perkins, 'France under Mazarin' (1894).

Mazatlan, mā-sāt-lān', Mexico, a town and seaport about 183 miles southeast of Sinaloa, at the entrance to the Gulf of California. It is built on a hilly crest and has a pleasing appearance. Mazatlan is the chief Pacific port of Mexico, and the outlet for the products of the mining district of Saint Sebastian; it has a considerable import trade. Pop. (1900) 17,400.

Mazdak, mǎz'dāk, Persian religious leader: b. Persepolis about 470 A.D.; d. Nahrvan between 530 and 540. He was a chief priest at Nishapur, and in 500 proclaimed himself a prophet. He converted King Kobad to his views, which forthwith became law. Khosru Nashirvan put him to death.

Maze, **Hippolyte**, ē-pō-lēt mǎz, French historian: b. Arras 5 Nov. 1839; d. Paris 25 Oct. 1891. He studied at the Ecole Normale Supérieure; taught there and at the Lycée Fontanes; was elected prefect of Landes in 1870, deputy in 1879 and 1881, and senator in 1886; and wrote: 'The Republic of the United States: Its Foundation' (1869); 'Hoche in Vendée' (1882); 'The Struggle against Want' (1883); 'General Marceau' (1889); and 'The Generals of the Republic' (1889).

Mazeppa, mā-zēp'ā, **Ivan Stephanovitch**, or **John**, hetman of the Cossacks: b. Podolia about 1645; d. Bender, Bessarabia, 1710. He was page to John Casimir, who was a patron of the arts and of literature, and he had therefore an opportunity of acquiring various useful accomplishments. A Polish nobleman having surprised Mazeppa with his wife, bound him naked upon his own horse, and committed him to his fate. The horse carried him to his own residence. Shame made him flee to the Ukraine and join the Cossacks, whose warlike roving life suited his disposition. He made himself conspicuous by his dexterity, bodily strength, and courage. His knowledge and sagacity procured him the post of secretary to the hetman Samilovitch, and in 1689 he overthrew Samilovitch, and himself became hetman. He gained the confidence of Peter the Great, who loaded him with honors, and he was finally made Prince of the Ukraine. In 1706 he opened negotiations with Charles XII. (q.v.) of Sweden for the purpose of freeing himself from Russian dominion, but his treachery was finally revealed to Peter, and he was obliged openly to declare for Charles. After the defeat of Pultowa, Mazeppa fled to Bender. Lord Byron has made Mazeppa the hero of a poem (1818).

Mazur'ka, a lively Polish national dance, popular also in the United States. The movements are of a grotesque character. The term is also applied to the music which accompanies the dance, sometimes in $\frac{3}{4}$ time, but for the most part in $\frac{3}{4}$. The mazurka is danced by four or eight couples.

Mazzini, Giuseppe, Italian patriot: b. Genoa 28 June 1808; d. Pisa 10 March 1872. He studied law at the University of Genoa, and practised his profession for a time, but he was soon drawn into a political career by his republican sentiments, and the condition of Italy under Austrian rule. His first political essays appeared under the mask of literary critiques in the 'Indicatore Genovese,' which was suppressed when the radicalism of his sentiments was discovered, and revived as the 'Indicatore Livornese,' to be in its turn also soon suppressed. He was an active member of the Carbonari, and while on a mission for that society was arrested and imprisoned for a short time; on his release he went to Marseilles, France, to escape the police surveillance imposed on him in Italy. Here he organized the society known as Young Italy, and established a journal to advocate his views; the purpose of the society was to liberate Italy and establish a national government, Mazzini desiring a republic. He took active part in the organization of an insurrection of which Genoa was to be the centre, but the plot was discovered and failed, and he was sentenced to death. He then went to Switzerland, where he organized another conspiracy for the invasion of Savoy (1834), which also failed. In 1836 he was banished from Switzerland and went to London, where he kept in correspondence with the revolutionary leaders on the Continent, was recognized as the head of the Young Italy party, and instigated several insurrections which were unsuccessful. After the insurrection in Milan in 1848, he again went to Italy, was chosen a member of the provisional government in Tuscany; and in 1849 when Rome was proclaimed a republic became the first of the triumvirs; in June the city was surrendered to the French, and Mazzini escaped to Switzerland and then to London. Later he had a hand in the unsuccessful uprisings at Mantua (1852), in Milan (1853), and in Piedmont (1857), being in Italy for a short time in 1857. He assisted also in organizing the expeditions led by Garibaldi in 1860, 1862 and 1867. An ardent republican, he refused to take his seat in the Italian parliament under the monarchy, though elected from Messina in 1865, as a protest against the uncanceled death sentence against him. In 1866 this sentence was formally rescinded; in 1870 he was arrested under charge of conspiracy with Garibaldi, and imprisoned for two months. Though his actions were sometimes politically indiscreet, he was a man of attractive character and strong personal magnetism, distinguished throughout his career for disinterested patriotism and the highest moral standards of conduct. He was interested in the labor movement, organized a workingmen's association in London in 1840, and was for a time connected with the International Workingmen's Association (q.v.), but withdrew from that society when it declared for socialism. During his later life especially his efforts were directed toward separating republicanism from both socialism and atheism. The best edition of his works is 'Seritti Editi ed Inediti' (1861-74); a partial collection is published under the title 'Life and Writings of Joseph Mazzini' (1891). Consult: 'Mémorial of Joseph Mazzini' (1877), containing his two essays, 'Thoughts on Democracy in Europe' and 'On the Duties of Man';

Linton, 'Recollections of Mazzini' (1892); Marriott, 'Makers of Modern Italy' (1889); and Thayer, 'The Dawn of Italian Independence' (1893); Martingono-Cesaresco, 'Italian Characters.'

Mazzola, māt-sō'lā, or **Mazzuoli, māt-soo-ō'lā**, **Francesco**, Italian painter, known from his birthplace as **IL PARMIGIANO**: b. Parma 11 Jan. 1503; d. Casal Maggiore 24 Aug. 1540. His father and two uncles were painters, and to them and to Correggio, who was in Parma in 1521, he owed his earlier training. Correggio's manner he caught so well that his 'Cupid Fashioning a Bow' was long and generally attributed to Correggio. When 20 he went to Rome and there imitated Raphael and Michelangelo. In 1527, upon the capture of Rome by Charles V., his losses were great and he had to escape from the city. He returned to Parma, lost his health, was imprisoned by the city authorities for failure to complete a commission which had been paid for in advance, and upon his release fled to Casal Maggiore, failing to live up to his promise to repay. His paintings are to be found in most of the galleries of Europe; mention should be made of the 'Madonna with St. Margaret,' in the Bologna Gallery; 'Madonna del Collo Lungo,' Pitti Palace, Florence; 'Annunciation,' Ambrosian Library, Milan; various portraits in the Naples Museum; several sacred subjects, notably 'Madonne' in the Dresden Gallery and in the Louvre; and the great frescoes in the Church of St. John, Parma. More important, though less well known, are Mazzola's etchings, since he introduced etching into Italy. His drawing is correct, and his work bold, fiery and graceful.

Mazzoni, Guido, gwē'dō māt-sō'nē, Italian scholar: b. Florence 12 June 1859. He was educated at Florence, Leghorn, and Bologna, in 1881 became instructor in Italian literature in secondary schools, and in 1887 professor of Italian literature at Padua. His poetic work has been to some extent influenced by his familiarity with English literature and largely by his countryman Carducci. Besides contributions to reviews, he wrote: 'Epigrammi di Meleagro da Cadora' (1880); 'In Biblioteca' (1882); 'Esperimenti metrici' (1882); 'Un Ritratto di Gesù' (1887); 'Rassegne litterarie' (1887); 'Fra Libri et Carte' (1887); and other works.

Mead, mēd, **Charles Marsh**, American Congregational clergyman: b. Cornwall, Vt., 28 Jan. 1836. He was graduated from the Andover Theological Seminary in 1862, studied in Germany and was ordained to the ministry in 1866. From 1866-82 he was professor of Hebrew at Andover, and for the succeeding 10 years lived in Germany as a member of the American Bible Revision Committee. He returned to the United States in 1892 and until 1898 was professor of theology at Hartford Theological Seminary. He has published: 'The Soul Here and Hereafter' (1879); 'Romans Dissected' (1891); 'Christ and Criticism' (1893); etc.

Mead, Edwin Doak, American author and lecturer: b. Chesterfield, N. H., 29 Sept. 1849. His early life was spent on his father's farm, and in 1866 he entered a publishing house in Boston. He studied in English and German universities 1875-9, and has since engaged in

MEAD — MEADE

lecturing and writing. In 1880 he was associate editor of the 'New England Magazine' with Edward Everett Hale, and chief editor 1890-1901. He is connected with numerous historical and social clubs, and has written: 'The Philosophy of Carlyle' (1881); 'Martin Luther — a Study of Reformation' (1884); 'A More Beautiful Public Life' (1894); etc.

Mead, Larkin Goldsmith, American sculptor: b. Chesterfield, N. H., 3 Jan. 1835. He was educated in the public schools and studied art in Brooklyn and Italy, where in Venice he was a member of the United States consulate. His first work was an ideal figure, 'The Recording Angel,' executed in 1855. He served for a time in the Civil War as illustrator for 'Harper's Weekly,' and since the war his work as a sculptor has given him national prominence. The statue of Lincoln on the monument at Springfield, Ill., is his work, as are the bronze statues of Ethan Allen at the Capitol in Washington and in Montpelier, Vt. His work includes many ideal pieces: 'The Returned Soldier'; 'The Return of Proserpine from the Realm of Pluto' (exhibited at the World's Columbian Exposition); etc.

Mead, Lucia Ames, American author: b. Boscowen, N. H., 5 May 1856. She is a lecturer and writer on social and economic questions, an advocate of advanced movements generally including woman's suffrage. She was married in 1898 to Edwin D. Mead (q.v.), is prominently connected with various clubs and has written: 'Memoirs of a Millionaire' (1890); 'To Whom Much is Given' (1898); 'Milton's England' (1902); etc.

Mead, William Rutherford, American architect: b. Brattleboro, Vt., 20 Aug. 1846. He was graduated from Amherst College in 1867, studied architecture in New York and Europe, and upon his return to the United States became a member of the prominent New York firm of McKim, Mead and White, which has had charge of many of the most important public and private buildings in the country. He is a brother of L. G. Mead (q.v.).

Mead, or Meth, a vinous liquor, used in northern Europe and made of honey and water by means of digestion and fermentation. It also receives an addition of fruit, spices and simples to give it a richer flavor. When new, mead has always a strong taste of honey, but this diminishes as it becomes older. Mead is mixed with the must of apples, or with wine, beer, and even vinegar, and then takes the name of wine-mead, beer-mead, etc.

Meade, mēd, Elizabeth Thomasina, English novelist: b. Bandon, County Cork. Her literary career began at 17, and later she went to London, where she was employed in the British Museum. She was married in 1879 to Alfred Toulminsmith, but continued her literary work, and for six years edited 'Atalanta,' a magazine for young people. Among her books are: 'Scamp and I'; 'The Way of a Woman'; 'The Cleverest Woman in London' (1898); 'Drift'; 'All Sorts'; etc.

Meade, George Gordon, American soldier: b. Cadiz, Spain, 31 Dec. 1815; d. Philadelphia 6 Nov. 1872. In 1835 he was graduated from the United States Military Academy and assigned to the 3d artillery, in 1835-6 served in the Semi-

nole war in Florida, on 26 Oct. 1836 resigned from the army, and in 1836-7 was assistant engineer in the construction of the Alabama, Florida and Georgia railway. He was later employed in various works of engineering, including surveys of the mouths of the Mississippi and of the northeast boundary between the United States and British North America. On 19 May 1842 re-entered the army as 2d lieutenant of topographical engineers. He joined Scott's staff at Corpus Christi, Tex., 14 Sept. 1845, and during the Mexican War participated in the battles of Palo Alto, Monterey, and Resaca de la Palma, and the siege of Vera Cruz. After the war he was occupied in light-house construction and in the geodetic survey of the Great Lakes (1857-61). He became captain in the corps of engineers in 1856. On 31 Aug. 1861 he was commissioned brigadier-general of volunteers, and assigned to the command of the 2d brigade of the Pennsylvania reserve corps of the army of the Potomac, stationed on the right of the lines before Washington. He served in the Virginia peninsula campaign, and took part in the actions at Mechanicsville (26 June), Gaines' Mill (27 June), and Frayser's Farm (30 June). On 18 June he was promoted major of engineers. At Manassas (second Bull Run), he commanded the 1st brigade of Reynold's division; and later he took a distinguished part at South Mountain (14 Sept.) and Antietam (17 Sept.). In the latter battle, when Hooker was wounded, he was placed in command of the First corps. For his services he was promoted major-general of volunteers 29 Nov. 1862; and at Fredericksburg (13 Dec.) commanded the 3d division of the First corps, with which he broke through Lee's right and penetrated to the position occupied by the Confederate reserves, but for want of support was compelled to fall back. At Chancellorsville (2-4 May 1863) he commanded the Fifth corps. On 28 June 1863 he was appointed commander of the army of the Potomac, to succeed Hooker. His command was then scattered, and on the march through Pennsylvania in pursuit of the Confederate invaders, Meade had everything yet to learn of both his own force and the enemy. At Gettysburg on 1-3 July he won the great and decisive battle with which his name is generally associated. (See GETTYSBURG, BATTLE OF.) He received the thanks of Congress and was made brigadier-general, U. S. A., 3 July 1863. During the remainder of the war he commanded the army of the Potomac with conspicuous ability, and on 18 Aug. 1864 became major-general in the regular army. From 1 July 1865 until his death he was commander of the military division of the Atlantic, with the exception of the period January 1868-March 1869, when he was in command successively of the third military district and the department of the South. He was a fellow of the American Academy of Arts and Sciences. There is an equestrian statue of him by Caden in Fairmount Park, Philadelphia, and one by Bush-Brown on the field of Gettysburg. Consult: Bache, 'Life of General G. G. Meade' (1897); Pennypacker, 'General Meade' (1901).

Meade, L. T. See MEADE, ELIZABETH THOMASINA.

Meade, Richard Kidder, American soldier: b. Nansemond County, Va., 14 July 1746; d.

MEADE — MEADOW-LARK

Frederic, now Clarke County, after 1800. He was educated in England at Harrow and in private schools. He had returned from England some years before the outbreak of the Revolution, and in 1775 entered the service of the struggling colonies, and distinguished himself in his first battle, that at Great Bridge. Recognition came speedily with an appointment to the staff of General Washington, with whom he remained until the close of the war. The supervision of the execution of Major André fell to his lot, a duty which while recognizing the necessity for it, he performed with deep regret. At the conclusion of the war he returned to Virginia to engage in the quiet life of the plantation.

Meade, Richard Worsam, American naval officer: b. New York 9 Oct. 1837; d. Washington, D. C., 4 May 1897. He was a nephew of General G. G. Meade (q.v.). He entered the navy as midshipman 2 Oct. 1850. His promotions were: lieutenant 23 Jan. 1858; lieutenant-commander 16 July 1862; commander 20 Sept. 1868; captain 13 March 1880; commodore 5 May 1892; and rear-admiral 7 Sept. 1894. On 20 May 1895 he was retired from the service. He was naval representative of the United States at the World's Columbian Exposition, Chicago, 1893. He published 'A Treatise on Naval Architecture and Ship-building' (1869).

Meade, William, American Protestant Episcopal bishop: b. near Millwood, Va., 11 Nov. 1789; d. Richmond, Va., 14 March 1862. He was a son of R. K. Meade (q.v.), and was graduated from Princeton College in 1808, studied theology, and took orders in the Episcopal ministry in 1811. His first charge was his home parish, which he served gratuitously, and in 1829 he was elected assistant to Bishop Moore. He was in charge of Christ Church in Norfolk, Va., in 1834-6, and in 1841 succeeded Bishop Moore as head of the diocese of Virginia. He was one of the founders in 1847 of the 'Evangelical Knowledge Society' and was the author of several works, among which are: 'Family Prayers' (1834); 'Reasons for Loving the Episcopal Church' (1852); 'The Bible and the Classics' (1861).

Meadow, Making and Care of. Meadows may be divided into general groups which will depend upon location, duration, and purpose, and their treatment will vary with each of these factors. Meadows located upon low ground, which may be inundated, or which is constantly moist, usually consist of grasses and other plants which do not thrive so well upon upland fields. Because of their dampness they cannot be treated like dry soils, and they are therefore more frequently permanent than temporary. Further, they are generally better adapted for haying than for grazing, because the grasses that naturally grow upon them are ranker, taller growing species and generally have grown to a considerable height before the land becomes dry enough to turn stock upon it. Except as to season the preparation of lowland meadows is not necessarily different from that of upland.

For best results the land should be deeply plowed as early in the season as soil conditions will permit, and harrowed at intervals of 10 days and after each rain that forms a crust until late summer. The practice will not only destroy weeds and weed seeds, but insure the

quick germination of grass seed sown even in dry weather, the soil being moist close to the surface. The soil may be anything, but preferably not sand or clay. If mucky, as in a reclaimed swamp, rolling is frequently advisable, otherwise generally not. Prior to plowing liberal applications of good manure or commercial fertilizers should be made and light annual dressings should also be given, preferably in autumn or early spring. Temporary pastures which are intended to last only three or four years should constitute part of a general rotation scheme (see ROTATION OF CROPS) and should be followed by some crop such as corn or potatoes, which can best utilize their products of decomposition. Permanent meadows should be inspected each spring and the spots which appear to be failing given special attention, such as fertilizing, liming, seeding, etc., to maintain a general good average. When the annual yield of hay falls below two tons the meadow may be considered unprofitable and should be plowed up and given a change of crop for three or four years.

In general, timothy or 'herd's-grass' is the most popular grass in America, because it is hardy, long-lived, large, easily cured, and its seed inexpensive and likely to be free from weed seed. Orchard grass, tall meadow fescue, red-top, ryegrass and cat-grass are also often used, but are secondary. Blue-grass, which generally appears as a volunteer grass in permanent meadows, is rarely profitable as a hay grass, but is unequaled in the North as a pasture grass. These grasses may all be sown with a sparsely planted cereal which acts as a "nurse crop." But this practice is generally considered inexpedient. The admixture of clover, however, is generally highly desirable, since the clovers supply nitrogenous food to the grasses. Alsike clover is considered best for mixing with timothy since it is somewhat later in ripening than the other large clovers, which mature before the timothy can be profitably cut.

Meadow-beauty. See DEER-GRASS.

Meadow Fescue, a fescue-grass (*Festuca*). See GRASSES IN THE UNITED STATES.

Meadow Grass. See BLUE GRASS.

Meadow-hen, the American coot. See COOT.

Meadow-lark, or **Medlark**, a beautiful American starling (*Sturnella magna*), numerous in eastern United States as far west as the high central plains, where it is replaced by a variety (*neglecta*) remarkably different in song and some habits. It is about 11 inches long, and the tail 5 inches. The body is thick and stout, the legs large, the bill long and straight, and the flight powerful. The upper parts are brown, marked with brownish-white, and the exposed portions of the wings and tail with transverse dark-brown bars; the under parts yellow, with a black crescent upon the breast, which is very distinctive as well as a handsome ornament. These birds receive their popular name "lark" from their terrestrial habits and way of singing in the air, uttering a loud sweet double call while circling upon fluttering wings above the meadow or grain-field where the nest is carefully concealed among the roots of the grasses. The eggs are white, profusely speckled with light red. The western variety has a longer,

MEADOW-MOUSE -- MEAL-TUB PLOT

more vivacious and tuneful song than the eastern bird, and is justly accounted the finest songster of the open regions of the interior. These birds are migratory in the northern parts of their range, but most of them remain during the winter in the middle parts of the United States and southward, and in the autumn are often shot for market. In the Southern States it is commonly called "old-field lark."

Meadow-mouse. See FIELD-MICE.

Meadow-pink, or Meadow-campion, the common cuckoo-flower (q.v.), or ragged robin (*Lychnis flos-cuculi*). See LYCHNIS.

Meadow-rue, a plant of the crowfoot family and of the genus *Thalictrum*. These ruees are erect perennial herbs, with small deeply cut leaves, and pretty flowers, usually in loose panicles. The genus contains about 75 species, scattered about the north temperate zone, of which the United States and Canada possess about 15 species, some of which are well-known. The early meadow-rue (*T. dioicum*) is a slender, leafy species, of rocky woods, a foot or two in height, whose flowers, purplish and greenish with yellowish antlers, appear in April or May. The purple meadow-rue (*T. purpurascens*), common in New England woods, is distinguishable by its size (2 to 4 feet tall), large, bright-green, waxy leaves and purplish stem; the flowers form a greenish fleecy bloom. A third large species is the thick-leaved (*T. coriaceum*) of the Southern States, whose flowers are of different hues, the staminate flowers being white and showy, while the pistillate flowers, borne on separate plants, are purplish. The tall meadow-rue (*T. polygonum*), towers to a height of 12 feet in favorable situations. All are fertilized mainly by the wind.

Meadow-snipe. See JACK-SNIPES.

Meadowsweet, a well-known handsome European plant (*Spiraea ulmaria*) of the rose family. It grows by the sides of streams and in damp places, has pinnate leaves, and stems two feet high bearing corymbs of white fragrant flowers. A decoction of it with coppers is used for dyeing black, and the root has been used as a tonic. It is also called queen of the meadow.

Meadville, mēd'vil, Pa., city, county-seat of Crawford County; on French Creek, and on the Erie and a branch of the Pittsburg, B. & L. E. R.R.'s; about 90 miles north of Pittsburg and 30 miles south of Erie. The first settlement was made in May 1788 by David Mead and others. It became a borough in 1823, and in 1866 was chartered as a city. It is in a fertile agricultural region, in the vicinity of extensive oil fields, and in the part of the State noted for its iron and steel industries. The chief manufacturing establishments are the Erie railroad shops, with nearly 2,000 employees; the Phoenix iron works, and the Meadville malleable iron works, with 500 employees; the Keystone vise works, with 250 employees; chocolate chips factory, with 150 employees; Barbour silk mills, 120 employees; shoe-button fastener works, silk mills, printing works, confectionery factories, engine works, and other manufactories employing over 500 persons. The city has 20 churches, an academy of music, court-house, three parks, the county fair ground, a race track, three iron bridges, and several fine wholesale and retail buildings. Its educational institutions are the

public and parish schools, a high school, the Meadville Theological School, opened in 1844 by the Unitarians; Allegheny College, opened in 1815 by the Methodist Episcopal; Pennsylvania College of Music, Meadville Business College, and a public library. There are the City Hospital and Saint Joseph's Hospital. The three banks have a combined capital of \$350,000. The government is vested in a mayor, who holds office three years, and a council. The charter of 1889 is in accordance with the general State law for establishment of cities. The electric-light plant and the waterworks are owned and operated by the city. Pop. (1900) 10,291.

WALTER IRVING BATES,

Editor of 'Tribune-Republican.'

Meagher, mā'hēr, Thomas Francis, Irish-American soldier: b. Waterford, Ireland, 3 Aug. 1823; d. near Fort Benton, Mont., 1 July 1867. He was educated at the Jesuit College, Clongowes Wood, Kildare, and at Stonyhurst College (near Preston), England; became one of the principal orators of the Young Ireland party, which aimed at independence through armed revolution; in 1848 was sent on a mission by the Irish Confederation to the French provisional government; and on 21 March was arrested on a charge of sedition. He was bailed, but on the passage of the treason-felony act re-arrested; and in October sentenced to death for treason. The sentence having been commuted to life banishment, he was removed to Tasmania (9 July 1849); but in 1852 escaped to the United States, where he was admitted to the bar in 1856 and practised in New York in 1856-61. In 1861 he organized a company of zouaves for the Federal army, with which he joined the 69th New York volunteers, under command of Colonel Michael Corcoran. After three months' service, he recruited the "Irish brigade" (1861-2), and was elected colonel of the 1st regiment. On 3 Feb. 1862 he became brigadier-general and took command of the brigade. He fought bravely at Richmond, the second Bull Run, Fredericksburg, and Antietam, and Fredericksburg, and after Chancellorsville found his command so reduced in numbers that he resigned. Early in 1864 he was reappointed brigadier-general of volunteers, and was assigned to the command of the military district of Etowah. He resigned 15 May 1865, was appointed secretary of Montana territory, and acted at one time as governor *pro tem*. He wrote 'Speeches on the Legislative Independence of Ireland' (1852). Consult: Cavanagh, 'Life, Writings and Speeches.'

Meagre. A fish. See MAIGRE.

Meakin, mē'kīn, Budgett, English author and writer: b. Ealing Park, England, 8 Aug. 1866; d. London 26 June 1906. He was educated at the Reigate Grammar School, became associate editor of 'Times' of Morocco, and was editor 1884-93. He lectured extensively on industrial questions and on Oriental subjects. Among his works are: 'The Moorish Empire' (1899); 'The Land of the Moors' (1901); 'The Moors' (1902); 'Model Factories and Villages'; etc.

Meal-moth; Meal-worm. See FLOUR INSECTS.

Meal-tub Plot, in English history, an alleged conspiracy, concocted in 1679 by an in-

former, Dangerfield, with the view of cutting off those who were opposed to the succession of James II. after he had embraced Roman Catholicism. The false charges to which Dangerfield was prepared to swear were found in the meal-tub belonging to a Mrs. Cellier, one of his friends. Ultimately he confessed his crime, was whipped, and condemned to stand in the pillory.

Mealy-bug, a scaleless scale insect of the genus *Dactylopius* and family *Coccida*. These insects are covered with a mealy, or waxy substance which they secrete for protective purposes. Like their relatives, the true scale insects, they also secrete honey-dew and are attended and transported by ants; unlike these relatives they do not lose the power of locomotion. The species are most numerous in tropical and sub-tropical countries; one species (*D. citri*) being the best known outdoor species in the United States, feeding upon citrus trees in Florida. In greenhouses another species (*D. destructor*) is often troublesome. Owing to the protective covering difficulty has been met in ridding plants of these creatures, but fumigation and caustic solutions have been tried with most satisfactory results. See INSECTICIDE.

Mealy Wing, a minute bug of the family *Aleyrodidae*, whose species (about 150 in number) have the wings covered with a white meal-like secretion. They are allied to the coccids, but differ in development and structural peculiarities; and throng upon the leaves of plants which they injure by sucking away the sap and also by attracting a growth of smut-fungus by their secretion of honey-dew. In this manner they blacken and harm orange and lemon trees in parts of Florida and Louisiana, where they are prevalent. Consult Howard, 'Insect Book' (1901).

Mean Value. If n quantities are commensurable, the sum of their units divided by n , the number of the quantities, is the *arithmetical mean* and is the *mean value* of the n quantities when their number is finite. For example, if the number of units in three quantities are respectively four, eight, and fifteen, the mean value is $\frac{4+8+15}{3} = 9$; and in general, if the

number of units in n quantities is denoted by $X_1, X_2, X_3, \dots, X_n$, the mean value is

$$M = \frac{1}{n} (X_1 + X_2 + X_3 + \dots + X_n).$$

But if a quantity vary continuously in accordance with some law, thereby assuming every possible value between two extremes, the number of different quantities is infinite, and the mean value in such a case requires a new definition. For example, assume that at every point in the diameter of a semicircle a perpendicular to the diameter is drawn to meet the semicircle. The lengths of these lines form a continuous series of values represented by every number from zero to r , where r is the length of the radius. In such a case if the n values of the perpendiculars are obtained and their sum is divided by n , the ratio would approximate to the mean value. But the limit of this ratio, as n is increased indefinitely, would be the mean value. It follows that the mean value will depend upon the law according to which the n values are selected. That is, the mean value of a continuously varying quantity is not definite

until the law that governs the succession of values is known.

The several forms of the theorem that pass under the name of the mean value theorem involve the principles of the infinitesimal calculus. The *first theorem of the mean value* is the following: Let $f(x)$ denote any finite and continuous function of x in the interval between $x = x_0$ and $x = X$; let dx denote the increment and retain the same sign in this interval; and assume that m and M are respectively the least and the greatest values of $f(x)$ in this interval:

then the definite integral $\int_{x_0}^X f(x) dx$ has a definite value that is greater than $m(X - x_0)$ and less than $M(X - x_0)$; that is:

$$m \int_{x_0}^X dx < \int_{x_0}^X f(x) dx < M \int_{x_0}^X dx.$$

Since $f(x)$ is continuous in the interval $X - x_0$, there must be a value $x = \xi$, where $x_0 < \xi < X$ such that $\int_{x_0}^X f(x) dx = (X - x_0) f(\xi)$,

$m < f(\xi) < M$. The value, $f(\xi) = \frac{1}{X - x_0} \int_{x_0}^X f(x) dx$, is called the *mean value* of $f(x)$ in the interval $X - x_0$. If we assume $F(x)$ to be the primitive or indefinite integral of $f(x)$, then $F(X) - F(x_0) = (X - x_0) f(\xi) = (X - x_0) F'(\xi)$ which is the familiar form of the law of the mean in the differential calculus.

For the extensions of the mean value theorem due to Lagrange, Cauchy and Schlömilch and Roche, which lie at the basis of Taylor's theorem, see SERIES. Reference may be had to William's 'Integral Calculus' for further illustrations and extension of the theorem to include functions of two or more variables.

Meander, mē-ān'dēr, in art, an ornamental design, in which the lines interlace; it is often used in decorating vases.

Means, mēnz, David MacGregor, American lawyer and author: b. Groton, Mass., 1 May 1847. He was graduated from Yale in 1868, studied theology at Andover and New Haven, was professor of economics in Middlebury (Vt.) College in 1877-80, and in 1881 was admitted to the bar and entered the practice of law. He contributed to periodicals, and wrote 'The Boss' (1894); and 'Industrial Freedom' (1897).

Means Grass. See GRASSES IN THE UNITED STATES.

Meares, mērz, John, English navigator: b. England 1756; d. London 1809. He entered upon a seafaring life at an early age and in 1776 he entered the navy and served in the war with the French until peace was declared in 1783, when he became a captain in the merchant service. In 1786 he explored the coast of Alaska and made in 1789 a second tour of exploration on the discoveries of which the British government based its claim to the possession of British Columbia and Oregon. He was the author of 'Voyages in the Years 1788-9, from China to the Northwest Coast of America' (1790).

Mearim River, Brazil, rises in the Serra do Negro, and after a northerly course of about 360 miles in the state of Maranhão, flows into the Bay of São Marcos near the city of Maranhão. It has numerous affluents, and is navigable, but the sudden tidal bores are dangerous.

MEARS—MEASUREMENT OF STREAMS

Mears, Mary M., American author: b. Oshkosh, Wis., 2 Jan. 1871. She was educated at the State Normal School in Oshkosh and first became known to the reading public in 1896, when her work appeared in the magazines and speedily made her popular as a writer of short stories. She has traveled in Europe in search of literary materials and has published, under the pen-name "GEORGE MADDEN MARTIN," 'Emmy Lou—Her Book.'

Measles (also called RUBELLA and MORBILLI), a communicable or infectious eruptive disease, one of the exanthemata, frequently epidemic, and sometimes dangerous because of its debilitating effects and tendency to end in inflammation of mucous membranes, such as pneumonia and enteritis. So-called black or malignant measles, occurring mostly in persons of very poor health, is usually fatal. Although measles is a disease of childhood, adults are not exempt from it. As a rule it attacks an individual but once. The contagious principle exists in the breath and in exhalations from the skin, the tears, the nasal and bronchial secretions, and the excretions. Clothing which has been in an infected atmosphere is liable to spread the disease. How long the contagium remains in infected articles is not known. The disease may be divided into four stages, beginning with the stage of incubation, or the interval (varying from 7 to 21 days) between the date of infection and the outbreak of symptoms, that is, the stage of invasion. The symptoms are chilliness, fever, pain in head, back, and limbs, bloodshot eyes, with intolerance of light, running of the eyes and nose, sneezing, and a troublesome cough. About the fourth day an eruption or rash appears (stage of eruption), first in the throat, then upon the face, trunk, and extremities, as minute pinkish red spots, which coalesce into blotches more or less crescentic in shape, raised above the surface of the skin. The eruption usually lasts about three or four days. Gradually disappearing (stage of decline), fever and catarrhal symptoms abate, and appetite returns. The cough may remain for days. The patient should be kept in a warm, well ventilated, and fairly lighted room, should be given easily digested food and plenty of water. Treatment should also regulate the bowels with saline medicines, and allay the severity of the cough with simple remedies. Severe symptoms require the attendance of the physician. Measles is contagious until the eruption has disappeared and all dead particles of skin have come away of themselves, or have been washed off by tepid baths.

Measure, a definite unit of capacity or extent, fixed by law or custom, by which relative sizes and capacities are ascertained and expressed; as, a yard, a measure of length; a gallon, a measure of capacity; a square foot, a measure of area; a cubic foot, a measure of volume, etc. See WEIGHTS AND MEASURES.

Lineal Measure.—The measure of lines or distances; the standard unit of lineal measure in the United States is the yard. The system is based on the law of nature that the force of gravity is constant at the same point of the earth's surface, and consequently that the length of a pendulum which oscillates a certain number of times in a given period is also constant.

Unit of Measure.—A given quantity, used as

a standard of comparison in measuring a quantity of the same kind. Every kind of quantity has its own unit of measure, and under different circumstances the same kind of quantity may have different units of measure.

Line of Measures.—The line of intersection of the primitive plane, with a plane passing through the axis of the primitive circle and the axis of the circle to be projected.

Measure of Angles.—The right angle being taken as the angular unit, its subdivisions are degrees, minutes and seconds. The right angle contains 90 degrees, the degree 60 minutes, and the minute 60 seconds. All smaller fractions are expressed decimally in terms of the second.

Measure of Magnification.—The measure of magnification, or magnifying power of any optical instrument, is the ratio of the magnitude of the image to the magnitude of the object, or more precisely, the ratio of the apparent diameter of the image to that of the object.

Measure of a Ratio.—Its logarithm, in any system of logarithms, or the exponent of the power to which the ratio is equal, the exponent of some given ratio being assumed as unity.

In Music.—The quantity of notes which are placed in the bar, and which is generally called the time, of which there are but two kinds, namely, common time, containing an equal quantity of notes in the bar, and triple time, containing an unequal quantity. Common time is generally marked with a C at the beginning, which means that every bar contains four crotchets, or their value in other notes. There are also other kinds of common time which are marked $\frac{2}{4}$, $\frac{3}{4}$, $\frac{5}{4}$. Triple time is marked $\frac{3}{8}$, $\frac{3}{4}$, $\frac{3}{2}$, $\frac{3}{4}$, $\frac{3}{2}$.

Measure For Measure, a tragedy-comedy by Shakespeare, first acted in 1604, and appearing first in print in the 'First Folio' of 1623. The outline of the plot is taken from the Italian novelist Cinthio, and from Whetstone's tragedy of 'Promos and Cassandra.' In 1662 an adaptation of the play, entitled 'Laws against Lovers,' was made by Davenant. Both Benedick and Beatrice appear in Davenant's version. A second adaptation, by Gildon, was produced in 1700 with the title, 'Beauty the Best Advocate.'

Measurement of Ships for Tonnage, or **Builder's Measurement**, a method of computing the tonnage of merchant vessels, in use among shipbuilders. Its results are nearly double the legal or registered tonnage. See TONNAGE.

Measurement of Streams. One of the many useful classes of work conducted by the United States Geological Survey; the measurement of streams having an industrial value. Wherever water is likely to be employed for power or irrigation the amount available is ascertained by that bureau. The volume varies greatly from season to season, and sometimes from year to year. Any calculation by the manufacturer or farmer which does not take this variability into account would be misleading. Moreover, streams differ among themselves in straightness, the character of their beds and other particulars. Accurate measurement is still further complicated by the lack of uniformity in the movement in a given cross section. What might be true for one point would not be true for other points to the right or left of it, or at a higher or lower level.

MEASURING WORM — MEAT-PACKING

The first step in the work is to place a gauge in a permanent position, and employ a suitable observer to read it every day. The gauge is graduated to feet and tenths. Usually it is upright. It may be laid over slanting, however. In that case, the spacing is widened, so as to give accurate results. One observation a day is made, and its result is transmitted on a postal card to Washington. The second factor in the hydrographer's computation is the velocity of the stream, at different heights. To ascertain this only occasional measurements are necessary. These are made by experts, but with their aid it is possible to prepare tables showing the total discharge of that particular stream for all the different gauge readings. After such tabulation is effected the maximum, minimum and mean flow for any month in the year can be told at a glance.

Velocity is ascertained with a meter lowered into the water. The instrument contains a tiny screw propeller, the number of whose rotations under the pressure of the fluid is automatically registered. Many types of meter have been devised. The kind which the bureau prefers has an electric wire leading up to a buzzer in the operator's pocket. There a click or other audible sound indicates to him the speed of the screw. He counts the number of revolutions for some definite period, usually fifty seconds, records it in his notebook, and moves along a short distance to make another observation.

If measurements are made at various depths along a vertical line, the results will not be equal. For this reason hydrographers have studied to find, if possible, a level that would fairly represent the average velocity for any vertical. In this way they can simplify the labor. It has been found that such an average can be secured by taking the speed at a depth of from six tenths to two thirds of the way down from the surface. To obtain a correct idea for the whole stream, though, these tests must be made at a number of places between one shore and the other. No measurement at a single point can be trusted to be fairly representative.

Measuring Worm, Inch Worm, Looper, or Span-worm, a caterpillar of any species of moth of the superfamily *Geometridae*. The creatures are characterized by the presence of only two pairs of abdominal legs, one upon the ninth, the other upon the anal segment, and by their peculiar form of locomotion, the rear of the body being brought forward toward the front legs and the body forming a loop at right angles to the surface upon which the insects walk. Nearly all the numerous species feed upon foliage, a few upon seeds in which they bore. Some are considered serious pests in orchards and upon shade trees; for instance, the canker worms (see APPLE, paragraph *Insects*), the lime-tree moth (*Hybernia tilia*), and *Cyatophora pampinaria*, which sometimes devastates cranberry plantations. The duration of the larva state is variable; from their great voracity they grow rapidly and shed their skins several times before attaining maturity; when arrived at this state they seek some sheltered spot in which to undergo the change to pupa form, some clinging to the lower surfaces of leaves while others bury themselves in the earth, those remaining in the air suspending themselves in

various ways by means of their silky secretions, others enclosing themselves in silky cocoons. Those burying themselves also build cocoons around them, but many of these only line their cavity with enough silken threads to keep the wall from falling in. One of the European species, *Fidonia Plumistaria*, is distinguished by curious feathery antennae. The caterpillars of this species are very injurious to fruit trees, especially those of the European magpie moth, *Abraxas grossulariata*, which inhabit gooseberry bushes, often entirely stripping them of their foliage. The caterpillar of the American canker worm moth, *A. niopteryx pometaria*, also belongs to this species of worm, the eggs being hatched in the spring; when grown they are about an inch long and of various colors, and are also dangerous to orchards. Most of the species, however, are of small economic importance. The caterpillars usually resemble twigs when at rest, their protective coloring and their attitudes serving to deceive their enemies. The caterpillars of a few species of the owl-moths, family *Noctuidae*, walk in this way, since they also lack prolegs upon the middle abdominal segments. They are not, however, considered true measuring worms. The geometrid moths are usually of small size and inconspicuous but delicate and beautiful coloration. Consult Holland, 'The Moth Book' (New York 1903); and Packard's 'Monograph of the Geometridae,' with colored plates, published by the U. S. Geological Survey in 1876.

Meat Extract, or juice of meat, has become since its introduction by Liebig (q.v.), a subject of great importance in medicine, dietetics and commerce. The chemical constituents of meat juice are not clearly established, although creatine, sarcine and inosinic acid are among the substances intelligently investigated. Phosphoric and hydrochloric acids and inorganic salts, with some coagulable ingredients are among the constituents. Beef tea while of value does not furnish complete food either for sickness or health.

Meat-packing. Meat-packing may appropriately be considered under three heads, namely, preparation and disposal of fresh (unsalted) meats; curing and preservation of meats by salting, smoking and the like, as is usually practised with hog hams, bacon, etc., and preservation of meats by hermetically sealing in tin cans, glass jars, etc., including the final sterilization necessary to complete the process.

Fresh Meat.—The preparation and disposal of fresh meats is perhaps the most important branch of the packing industry and in its development is the newest. Fresh meat has been, of course, an article of commerce from the earliest times; but it is only within recent years that the art of refrigeration has been perfected to an extent enabling fresh meat to be shipped thousands of miles and its condition and quality so conserved that it is more desirable and palatable after arrival at destination than when first slaughtered. Fresh beef, particularly, is much more juicy and tender if well refrigerated and kept two weeks or more after slaughter. Fresh meats will keep best if held in a temperature slightly above the freezing point, but in practice a temperature of 35° F. gives good results, except for long shipments such as from United States ports to Europe, in which cases approximately the freezing point should be main-

MEAT PRODUCTION.

MEAT-PACKING

tained; and it may here be observed that lean meat freezes at about $1\frac{1}{2}^{\circ}$ lower temperature than water.

Freezing is slightly injurious to the quality of fresh meat, but by freezing hard and holding at a temperature of 10° F. it may be kept without taint for many months. When beefs are in good supply and cheap, the choice cuts, such as ribs and loins, are frozen and held in large quantities until the winter and spring season, when they usually meet with a more favorable market. Fresh pork and mutton are sometimes frozen and carried from season to season, but the volume of this trade in the United States is not great, comparatively. This carrying from the season of over-supply to the season of under-supply by means of freezing has a doubly beneficial effect on the market, increasing the demand for live stock during time of glut, and increasing the supply of choice cuts during the time of scarcity.

The dressed carcasses are, immediately after slaughter, still being suspended from the trolley hooks on which the latter part of the dressing operation is done, run into refrigerated rooms and chilled, usually for two days. The cattle carcasses, and usually the hog carcasses, are split through the back bone into "sides." After chilling, the sides are cut, the beef usually into quarters and the pork into smaller pieces. The quarters of beef are shipped hanging on hooks in refrigerator cars, and the smaller pieces intended for sale fresh are usually boxed and shipped also in refrigerator cars. Mutton and lamb are shipped in the same way, usually in whole carcasses. The refrigerator cars used depend upon ice for their temperatures, and the most successful cars use the ice crushed and with from 6 to 12 per cent of rock salt intermingled.

The development of the fresh meat branch of the packing industry received its first important impulse from George H. Hammond, who, in the summer of 1869, began at Hammond, Indiana (a suburb of Chicago), the business of shipping fresh beef in refrigerator cars to Boston. The first year the business was not successful, but it was courageously continued, the difficulties were gradually overcome, and the second year found it more satisfactory, and the volume amounted to about 600 quarters per week. During the following two years this volume was doubled and it continued to grow moderately until, in 1877, Gustavus F. Swift established at the Union Stock Yards, Chicago, a similar business. Under the stimulus of this competition the trade increased rapidly, consignments were made to other cities in New England and New York, other houses entered the trade, and by 1885 it became apparent that this new method of slaughtering cattle near their native pastures and shipping the fresh meat, was destined to supersede, largely, the older method of shipping them on the hoof and slaughtering near the place of consumption. Today, in 1905, nine tenths of the fresh beef used in the principal cities east of Chicago, and out of the cattle raising belt, arrives at destination in refrigerator cars and local slaughtering has been largely abandoned. What is true of fresh beef is true also of fresh mutton and pork.

In the early days of the fresh meat branch of the packing industry, it became apparent that new methods of handling and disposal at destination were necessary; obviously, *fresh* meat,

could not be received in carloads and distributed to the retail dealer, through an ordinary, unrefrigerated warehouse, as had been the custom with cured meats. To meet the necessities of the case, refrigerated rooms were built, with systems of overhead tracking, on which quarters of beef and carcasses of small stock were stored and handled, suspended from trolley hooks. In connection with these refrigerated rooms, or *beef coolers*, as they came to be known in the trade, there were built suitable shipping rooms, offices, etc. These distributing houses were, as a rule, built adjacent to railroad tracks, enabling the direct discharge of meats from the cars. As the business began to assume some magnitude, it became evident to the packers that great care in the construction, maintenance and operation of these distributing houses was of the utmost importance; it was therefore desirable that a packer own houses for distributing his fresh meat, thus being in position to control, absolutely, conditions of cleanliness and temperature. The earliest fresh-meat packers did not engage in the other branches of meat-packing; but as soon as it became apparent to the older packers, who had previously confined their fresh-meat business to the locality of their packing houses, that the new method of distribution was successful, they began to enter the fresh-meat business aggressively, which in turn forced the pioneers of fresh-meat packing to add the other branches to their business, because a packer having all kinds of meat product to offer to the retailer had an obvious advantage. This diversification caused, in turn, the development of the distributing house, the addition of smoke-houses for smoking hams and bacon, store-rooms for canned meats, lard, etc., until to-day the leading packers own, in the principal cities of the country, their distributing houses, where the retailer may obtain any form of animal food-product, including many by-products. There are more than one thousand such houses scattered throughout the United States. This branch house system of distribution, by its economy and thoroughness, and its adaptability to supply a wide variety suited to all the local needs, has been one of the prime factors in the growth of the meat-packing industry.

The beginning of this branch of the packing industry was coincident with the successful application in a large way of refrigeration to railroad cars. The first cars were, however, comparatively crude, and the modern refrigerator car, as used to-day by practically all of the packing companies, has reached its present state of development by a steady growth of improvements made from time to time. This matter of perfection of the refrigerator car has been one in which there has been great rivalry among the various packers, and to this competition is due the high efficiency of the present refrigerator car for carrying fresh meat. The building, maintenance and care of these refrigerator cars is the field of one of the most important departments in connection with the various packing companies. The cars must not only be kept in first-class running order so as to make them suitable for operating on fast trains, but they must be kept in a high state of cleanliness. The icing of the cars is also a very important feature and has to be done with the utmost care. Before loading, the cars must be iced at least 24 hours in advance,

MEAT-PACKING

so as to be thoroughly cooled. They are then re-iced at the time of shipment and are re-iced in transit as necessary, depending upon the length of the journey. Immediately after unloading, the car is scrubbed with soap and hot water, all hooks are wiped clean, and the car is ventilated so that it will return home in a sweet, clean condition.

Curing and Preservation by Salting, Smoking, etc.—The preservation of meat by salting, smoking, etc., was the first method extensively practised, and the term "packing" now applied to the whole business, formerly had a narrower meaning and was used in connection with this branch exclusively. In fact this was, in the early days, the only branch.

From the earliest times meats have been cured by salting and smoking and in principle there is nothing essentially different in the practice of the modern packing plant from the curing processes used by the packers of earliest days. The business is now conducted on a much larger scale, and with more care as to conditions, particularly as to refrigeration and sterilization, so that meats are now cured with less salt than formerly, or to use the trade expression, *mild cured*.

The two methods of curing with salt are known as "pickling" and "dry salting," and these terms are relatively descriptive. In pickling, the meat, after being cut into hams, shoulders, etc., is submerged in pickle or brine and kept under the surface with weights or other devices, so the salt in the pickle is diffused through the meat. This causes the strength of the pickle to decline and the meat must occasionally be removed, and placed in a fresh hogshead with re-strengthened pickle. The usual time of cure varies with the size of the joints or pieces of meat, but ranges usually between 30 and 45 days. The pickle is made of various strengths for various cuts of meats, but is generally 40° to 60° salometer, and for hams, bacon and the finer cuts of meat contains sugar as well as salt. Some curers also use small amounts of other salts of sodium, but the modern tendency is to use nothing but common salt, and sugar. Meats for consumption in the United States are generally cured in sweet pickle.

The process of dry-salting is to pile the joints or cuts of meat closely in layers on the curing floor, first rubbing them thoroughly with salt, and sprinkling salt freely between the layers and on top. The piles are made three or more feet in height, and the meat is left for ten days, when it is overhauled, rubbed again with salt and re-piled; and this overhauling is repeated again in another ten days. The time necessary for the curing by the dry-salt method is substantially the same as by the pickling method. The dry-salting method is used for most meats for exportation to Great Britain, and the method is frequently spoken of as "English cure," being the standard method in England.

Hams, shoulders, bacon and side meats are, after curing, generally smoked. The process of smoking is also quite old and its origin unknown. The meats are hung in brick houses or compartments in tiers, as closely together as practicable without touching, a slow fire of wood is built beneath, and the meats kept in the resulting smoke for 12 to 48 hours. They are then cooled, wrapped, boxed and made

ready for shipment. Hams and bacon, also shoulders, generally have a brand burned in the skin before wrapping. For shipment to hot climates the pieces, after wrapping in paper, are also "canvased," or sewn up in cotton sheeting, and coated with a thick pasty solution of China clay, barytes or the like, and then dried. This forms an air-tight, vermin-proof covering. Hickory and sugar maple are the best woods for smoking.

The preceding paragraphs relating to the curing of meats by salting, smoking, etc., describe the process as applied to meats of the hog. Beef is cured in like manner by pickling and is generally shipped to destination and kept in the pickle until removed for consumption. An exception is "dried beef," being the suitable lean pieces, which, after curing in pickle, are smoked slowly for several days so as to dry them to a firm condition.

Preservation by Hermetically Sealed Cans, etc.—The method of preserving meat by packing in hermetically sealed tin cans and the like was introduced commercially into the United States about the year 1873 at Chicago, Illinois, by William Wilson and John Wilson. In the following year Libby, McNeill & Libby also entered this trade, and during succeeding years other houses followed. The business grew rapidly from the beginning, and has reached great magnitude.

The process in brief is as follows: The meat after being trimmed from the bones and cut into small pieces is put into a curing pickle composed of common salt and a little sugar in solution; also a very small quantity of saltpetre is commonly used. It is left in this pickle any length of time from a few days to 20 days, depending upon the degree of saltiness desired. It is then taken out of the pickle and cooked in hot water until thoroughly done. After this the gristle is trimmed out, the surplus fat is removed, and the pieces are cut into small and comparatively even sized bits, usually not exceeding four cubic inches. In this condition, and while still hot, it is stuffed by an automatic machine into tin cans which have previously been prepared and thoroughly washed. Each can is then weighed so as to get the correct quantity of meat in it, and is "capped," that is, a small tin disc is soldered over the hole through which the meat is introduced into the can. The further steps of the process embrace the sterilization, or so-called "processing," which consists in heating the cans for a number of hours up to a temperature of 250° to 350° F., depending upon the size of the can and the kind of meat. The object in heating is sterilization, being the same process as is pursued by the house-wife in canning fruit, etc. The cans are then washed, cooled, labeled and the exposed surfaces are coated with a varnish to prevent rust. They are then ready to be packed and shipped to all parts of the world, and will keep for years without deterioration.

By-products.—The business of meat packing as practised in Chicago and the other large packing centres of the United States involves not alone meat preserving, but the entire range of slaughtering, preparation of the fleshy and other edible parts, and preparation of the by-products, such as hides, hoofs, horns, bones, hair, fats, intestines, blood and viscera. In many of the most prominent es-

MEAT-PACKING

tablishments these by-products are manufactured into the resulting leather, glue, buttons, combs, curled hair, soap, candles, oils, glycerin, etc. Largely for sanitary reasons, all the modern establishments manufacture the blood and residual solids from their fat rendering apparatus into fertilizers, in some cases the blood-albumen being first separated and dried independently.

The annexed diagram will illustrate graphically the disposition usually made of the different parts of beef cattle.

Corresponding parts of other animals are put to similar uses. The stomachs of hogs are utilized for pepsin manufacture. Some of the glands of hogs, sheep, and cattle, notably the thyroid and pancreatic, are used in the production of pharmaceutical preparations. Sheep skins first have the wool pulled from them and are then utilized for leather, the cuttings being made into glue. Hog hair and bristles are made into curled hair and brushes. Curled hair is sold for mattress making. All scraps and parts, not put to some more important use, are cooked, desiccated and used for fertilizing material, the chief property of which is nitrogen.

General.—By the careful study of economy in utilization of by-products at least \$1.00 to \$2.00 of value per head is now derived from parts formerly wasted. To-day there is practically nothing wasted. This close study of economy in saving everything enables the packing business to be done on an unprecedentedly small margin of profit. For a series of years, including 1904, the fiscal reports, made by some of the largest and most successful packing corporations to their stockholders, show that their profits ranged from $1\frac{1}{2}$ to 2 per cent of their distributive sales.

It must occur to all thoughtful persons that in a business of such large volume the securing of steady and sufficient supplies of fat animals is of prime importance, and the query naturally comes as to how this is done. Almost the entire supply of live stock is purchased from day to day, as needed by the various packing companies, at central markets in the large cities, such as the Union Stock Yards of Chicago, Kansas City Stock Yards of Kansas City, National Stock Yards of East Saint Louis, etc. These stock yards are equipped to receive live stock in train loads—unload, pen, feed, water, and otherwise care for the comfort and health of the animals.

Live stock raisers most frequently sell their animals at home to a dealer, who, in turn, consigns to a commission salesman at some central market, where the buyers for the various packing companies meet in competition and bid for each lot or carload. The bidding is not by public outcry or auction, but by each buyer independently. There is no public system of grading, but each purchase is made on individual inspection and judgment of the buyer and salesman.

The development of these stock yards has kept pace with the growth of the packing industry. Indeed, these large central markets for live stock and the packing plants are interdependent and mutually helpful. Together they constitute one of the modern wonders of our commercial development. The benefits to the raiser of live stock, the live stock dealer, the transportation companies, the retail dealer, and

to the consumer, of an organized business that affords the producer an every-day cash market for any number of animals, the carrier a reliable and steady freight volume, and the retailer—and through him the consumer—a constant supply of the widest variety of kind and quality of animal food products, can hardly be exaggerated. To appreciate these benefits, let the reader try to imagine a return to the conditions of a generation ago. Within the memory of many still engaged in the business, the farmer had only a local and very uncertain market for his live stock. He could sell in limited numbers, must find his customer by inquiry, and frequently had to wait for weeks after his stock was ready and ripe for slaughter. The butcher also depended on local supply, and must needs ride through the countryside and inquire, and frequently felt compelled to buy and use stock of a quality not suited to the demands of his business. He had to drive the animals to his little, unsanitary abattoir, slaughter them himself in the cool hours of the night, and hurry the sale of the fresh meat before incipient decomposition. He was constantly oversupplied or undersupplied, had too much of one grade and too little of another, and so frequently met with losses that his margin of profit must needs be large. The consumer, of course, could fare but ill under these conditions. He might whet his appetite with the thoughts of a juicy porterhouse or a prime rib roast, and find his butcher could furnish only veal or pork chops, and was compelled constantly to choose from a narrow and unattractive variety, and to pay an excessive price. Values were unstable and varied greatly, and producer, dealer, and consumer alike suffered.

To-day the modern packing house, with the central market for live stock which it has built upon one hand, and its system of refrigeration and distribution on the other hand, brings the producer and consumer into such near touch that the one can market his animals in any numbers any day, and the other can buy in any town or village of the country having railroad connections, any desired quantity and quality of so wide a variety of animal food products that his slightest whim or necessity can be satisfied.

This bringing together of the producer and the consumer, the modern packer, with the aid of our railroads, stock yards, and refrigeration, has accomplished, to the enormous benefit of both; and to-day the actual producer gets a much larger part of the total price paid by the actual consumer than ever before.

In this age of engineering and mechanical advancement, the use of machinery has, of course, played a prominent part in the development of the business of meat-packing. The modern packing plant is divided into many departments, so related with reference to each other that the whole, in reality, constitutes a vast machine. The invention and perfection of machines to do the various kinds of work has been given a great deal of attention, and the practical men in connection with the different packing companies have vied with each other so that improvement has followed improvement, in many cases one machine being improved by another before fairly having the new worn off. To-day, in the most up-to-date packing plants, the vast majority of the operations carried on

MEATS AND MEAT PRODUCTION

are done by machines. Such plants are operated entirely by electric power, are lighted by electricity, supplied with water by electric pumps, refrigerated with cold brine circulated by electric pumps, and in some cases even the live animals themselves are hoisted from the ground to the top floor of the slaughterhouse by enormous electric elevators, carrying a carload at a time. They are hoisted to meet the knife by means of electrically-driven hoists. Hogs are scalded, scraped, cleaned, and delivered to the chill-rooms by machinery, hand work being reduced to less than half what it formerly was. The meats are cut by machinery, also sprinkled and rubbed with salt and packed. Hams are branded by machinery, and are carried by mechanical means to the loading platforms, ready to go into the cars.

In the handling of by-products, various machines do all of the most important work. Fertilizing materials are cooked, pressed, dried, ground, sifted, and packed in bags and weighed by machines. Bones are dried, sawn, made into knife handles, buttons, crochet hooks, etc., largely by automatic machinery. Glue is evaporated, the jelly sliced, dried, broken, ground, bolted, and packed into barrels by machinery. Soap is cut into bars, stamped, wrapped, packed into boxes, and the boxes nailed, and printed by machinery. Soap powder is mixed, ground, sifted, packed into cartons, labeled, pasted, and delivered to the boxes by machinery. So on, throughout the various departments, great attention has been given to the introduction and perfection of machines, so that the modern packing plant, volume considered, uses no more than half the hand labor that would have been required 20 years ago to do the same amount and variety of work.

Owing to the nature of the business and its wide diversification, statistics of meat packing for the entire country are not available. Slaughtering is done in every village, and almost every small butcher, to a certain extent, cures and smokes meat.

For many years trade papers, notably 'Cincinnati Price Current,' have, so far as practicable, kept records of pork packing at principal points in the East and West, and have published figures which, for pork packing, are probably approximately correct, for all packing done at points east of the Rocky Mountains and at plants doing any considerable volume of business. These points are divided into "Western" and "Eastern." The "Western" points include:

Illinois: Chicago, Bloomington, Peoria, Alton, Quincy. *Missouri:* Kansas City, South Saint Joseph, Saint Louis, Cape Girardeau, Jackson. *Nebraska:* South Omaha, Nebraska City. *Indiana:* Indianapolis, Ft. Wayne, Logansport. *Wisconsin:* Milwaukee, Cudahy, Eau Claire, Jefferson, La Crosse. *Ohio:* Cincinnati, Cleveland, Dayton, Toledo, Hamilton. *Minnesota:* Saint Paul, Austin. *Iowa:* Sioux City, Cedar Rapids, Ottumwa, Des Moines, Marshalltown, Davenport. *Kentucky:* Louisville. *Michigan:* Detroit. *Kansas:* Wichita, Topeka, Leavenworth. *Texas:* Fort Worth, Dallas, Sherman. *Pennsylvania:* Pittsburg, Allegheny. *West Virginia:* Wheeling. *Tennessee:* Chattanooga, Knoxville, Morristown. *Colorado:* Denver.

The "Eastern" points include:

Massachusetts: Boston, Worcester, Brightwood. *Connecticut:* New Haven. *Rhode Island:* Providence. *New York:* Albany, Troy, Hudson, Buffalo, New York. *Pennsylvania:* Pottsville, Allentown, Bridgeport, Coatesville, Harrisburg, Mt. Carmel, South Bethlehem, Philadelphia. *Maryland:* Baltimore.

The figures for cattle and sheep slaughtering cover a much smaller number of places, and no figures of actual slaughtering are available except for the leading packing centres. For the large Eastern cities, New York, Boston, Philadelphia, and Baltimore, no figures for actual slaughtering can be obtained, but accurate figures are available showing receipts of cattle and sheep, which, presumably, correspond with local slaughtering.

LOUIS F. SWIFT,
Of Swift & Co., Chicago.

Meats and Meat Production. The discussion of the subject will be confined to a consideration of the properties, use and production of the flesh of cattle, sheep and swine for human food. All organic matter is made up of dry substance and water. The per cent of water in meats varies from 10 to 78. Moisture in meat or other foods aids in the various processes of digestion, especially in mastication. It also assists in the assimilation of foods. The two things which appear to have the greatest influence upon the percentage of water in meat are the age and condition of the animal. Other things being equal, the younger the animal the more water its flesh contains, while the higher the percentage of fat in meat the lower the percentage of water. From 50 to 65 per cent of the fat steer is meat. The remainder is made up of by-products, in general, such as hides, fat, offal, etc., less valuable than beef. A physical examination of meats shows them to be made up of muscular tissue or lean meat, fatty tissue or fats, connective tissue or the gristle, and bone. From the standpoint of the nutritive value of meat, gristle and bone are practically refuse.

Composition.—Chemically, meat is composed of proteids, fats, water, ash, and carbohydrates, which are the necessary food constituents for the production of energy and repair of the animal body. The amount of carbohydrates is so small as to make it almost a negligible factor. Extractives are also present in meats which are believed to be responsible for meat flavors. While differences in the chemical composition of two cuts of meat are not necessarily an indication of their relative food value, yet the composition of meats in general is important as indicating their place in the diet of man. Lean meat contains from 15 to 21 per cent proteid; whole eggs, 12.5 per cent; fresh, whole milk, 3.4, and cheese from 25 to 30 per cent. Fresh vegetables, other than peas and beans, contain 0.5 to 3 per cent proteid; fresh peas and beans, 12.5 per cent; wheat flour, 10 to 12 per cent, and dry peas and beans 25 to 30 per cent. Thus it will be seen that meat contains a relatively high percentage of proteid, a most necessary food constituent, and one which is generally found in too limited quantities in human food. Good authorities agree that the supply of protein should be abundant, since as far as is known it is the only source of bodily repair. Protein may take the place of carbohydrates and

MEATS AND MEAT PRODUCTION

fats in animal nutrition to a limited extent, but carbohydrates and fats cannot take the place of protein. The mineral matter comprising the ash of meats is made up chiefly of calcium phosphate and potassium phosphate. The percentage of ash in fresh edible meats varies from 0.5 to 1.5. Meat sugar comprising about 0.5 per cent of meats figures but insignificantly as a carbohydrate. The percentage of proteids is the least variable of any of the constituents of meat. The necessity of proteids is understood when we conceive that the body is made up of 50 per cent muscle and that one third of the muscle is protein. Good authorities agree that at least one third of the proteids required by the body should be furnished by animal products.

Nutrition.—From one tenth to one third the cost of food in the average family is paid out for meats. Some facts are given therefore which throw some light on the question as to the desirable qualities of beef. Beef is used to illustrate the matter of quality because it is pre-eminently the most popular flesh food and because quality means more in beef than in mutton or pork, especially the latter. If all the desirable qualities of beef could be secured in one cut it would be palatable, nutritious, and economical. This is practically impossible, however; there are wider differences in cuts of meat as to palatability and cost than as to food value, while the less expensive cuts may be rendered more palatable by proper methods of cooking. Palatability of beef depends upon tenderness, juiciness, quality and flavor. Tenderness, juiciness, quality and flavor depend upon the age of the animal, the location of the cut, the condition of the animal as to ripeness, the degree of ripeness of the meat and the method of cooking. As a rule the younger the animal the more tender the meat. Perhaps nothing, however, has more influence upon tenderness than cooking,—different cuts requiring different treatment. The flesh of young animals invariably lacks that fine marbled appearance, or distribution of fat throughout the muscular tissue that is so characteristic of beef of high quality taken from mature bullocks that are in a finished or well fattened condition. The beef of young cattle is also more or less lacking in flavor. Satisfactory flavor in beef is of course largely a matter of individual preference, but a reasonable state of maturity and development is required to give beef its most characteristic flavor. It is significant that the more tender cuts of beef, such as the tenderloin, lack noticeably in flavor. Good judges agree that the best flavored beef comes from muscles which are frequently used during the life of the animal. This exercise renders these muscles tougher, but of distinctly higher flavor. Beef cut from cattle of rather advanced age or for that matter from cattle of any age, is rendered relatively more tender by the ripening process. Fresh beef that has not hung in the cooler for ten days to two weeks lacks both in tenderness and flavor. Even a longer time in cold storage is desirable with the highest grade of beef. The beef cut from well fattened steers of good quality or containing a high percentage of beef blood can be much more satisfactorily ripened in cold storage than that cut from mongrel bred steers which have been slaughtered in an indifferent condition. Carcasses of prime steers pos-

sess a characteristic coating of surface fat which protects the lean beef from too much exposure and gives it an opportunity to fully ripen. In the case of the carcass from the medium and common grades the beef frequently lacks that surface fat which seems to serve such a useful office during the ripening process. Low grade beef will literally rot before it will ripen. Juiciness in beef is largely dependent upon the percentage and distribution of fat, and the method of cooking. While an abundance of fat anywhere on a cut of beef adds materially to its apparent juiciness, an even distribution of fat throughout the muscular tissue, a condition which gives to the meat when carved (especially when cold) that beautifully marbled appearance, is the leading factor in contributing ideal juiciness to the beef. Juiciness may be easily destroyed by too prolonged roasting or broiling. The marbled quality in beef is seldom seen except in reasonably mature, well fattened cattle.

Prime condition in the live animal is essential for producing high quality in beef and other meats as well. In order to secure the highest quality in meats the consumer must pay a relatively high price for the cuts of meat or buy considerably more fat than can be agreeably eaten along with the lean of the cut, thus making it necessary to utilize the superfluous fat for other purposes or consider it as waste or refuse. In either instance it renders the edible meat of high quality relatively high priced as compared with low grade meat. On the other hand, meat of high quality need not necessarily be the most expensive for the consumer to purchase, for, when properly cooked, it is so delightfully tender and juicy that all of it is edible, save possibly a small amount of superfluous fat. However, this extra fat is of such quality that it can be readily rendered and used for cooking purposes to supplement or in some instances satisfactorily take the place of more expensive shortening. Another fact which should not be overlooked is that the cheaper, and as generally considered, less palatable cuts taken from a carcass of beef possessing high quality are often fully as desirable as the best cuts from low grade carcasses.

Packing.—The packer or slaughterer of meats is willing to pay a premium for animals in prime or well fattened condition because when slaughtered they yield a higher percentage of dressed meat, fat, and, in the case of cattle, hides. Not only is this true, but the packer understands that prime condition in the live animal is a strong indication of high quality in the carcass. In fact, it may be said that condition is a prime requisite for producing high quality. It has a greater influence undoubtedly than high breeding. Again, the packer pays a premium for cattle prime in condition and prime in quality, or good breeding, because in well-bred animals the percentage of high priced cuts is greater than in mongrel or indifferently bred stock. Undoubtedly, the tendency of the meat trade for several years has been to concentrate a large part of the slaughtering of the country at leading market centres like Chicago. In other words, gigantic and powerful packing companies have developed from small beginnings until they have within their combined power the ability to practically regulate the market for live cattle, hogs and sheep and meats

MEATS AND MEAT PRODUCTION

the world over. Chicago, the greatest live stock and meat market in the world, is each year enormously increasing its business in buying and slaughtering live stock. A large majority of local meat markets in the cities and villages throughout the United States are supplied through the medium of the packing houses located at our leading live stock markets. Packing houses can furnish any grade of meat desired. For example, in beef they can supply all grades from No. 1 to canning stock at prices corresponding with the quality. So economically is the business of the packing houses administered and so well organized are the various industries growing out of the wholesale slaughter of meats that it is possible for them to sell practically all grades of beef in cities and villages remote from their central plant at prices which successfully compete with local competition. The local purveyor of meats can buy whatever grade of meat he can dispose of to advantage. As a rule in the smaller cities and villages the retailer buys a medium to low grade carcass, because his trade is not willing to pay prices which of necessity must be paid to secure meat of high quality. It is safe to say that the beef offered at such markets is seldom above No. 2 in grade, no matter whether the market is supplied by packers or local slaughterers.

It is impossible to predict the ultimate effect upon the meat trade of the change from local to packing house slaughtering. On the one hand a packing house trust can control the price of live cattle, sheep and swine in such a manner as to reduce, temporarily if not permanently, or in some instances, destroy entirely the profits of the meat producing industry; on the other hand, such a trust can control the price of meat in the carcass to such an extent as seriously to discourage the consumption of meat by raising the price to such a degree that it will become one of the most expensive articles of diet. This power is not likely to be permanently exercised to the disadvantage of the public good, for it should be borne in mind that the very life of the packing business depends upon an active demand for meats by the consuming public. This demand will not exist when prices of meats are too high as compared with other food-stuffs. Producers will cease to prepare live stock for the block when the business becomes clearly unprofitable. In other words meat is not an absolutely necessary part of the diet of the masses, nor is the permanency of agriculture dependent upon continuous live-stock production.

Consumption and Production.—Notwithstanding improved methods for meat production the actual cost of cattle, sheep and swine as put upon the market by producers the world over is steadily on the increase. Nowhere is this in-

creased cost any more manifest than in the United States. Changes already referred to in the methods of slaughtering and increased cost of production of meats have not lessened the gross or even the per capita consumption of meats in the United States or Great Britain. The per capita consumption of beef in the United States has increased 15 per cent in the last few years, while it is probable, although statistics are wanting to substantiate the statement, that the per capita consumption of other meats has increased still more. The table at the bottom of this page, from Williams' 'The Forfeigner in the Farm Yard,' shows the increase in per capita consumption of meats in the United Kingdom of Great Britain:

CATTLE AND BEEF PRODUCED IN THE WORLD.

COUNTRY	Number of cattle other than milch cows	Annual tons beef
United States	53,100,000	3,059,000
Russia (in Europe).....	27,600,000	1,546,000
Argentina	22,900,000	
Germany	17,600,000	985,000
Austria-Hungary	14,200,000	795,000
Australia	13,300,000	325,000
France	12,900,000	780,000
Great Britain	10,900,000	661,000
Italy	5,000,000	280,000
Spain	2,100,000	112,000
Remainder of Europe.....	13,900,000	779,000
Canada	4,200,000	235,000
Total	197,700,000	9,561,000

The following table shows the annual per capita consumption of meat, including beef, mutton, and pork, for different countries:

ANNUAL PER CAPITA CONSUMPTION OF MEAT.

	Pounds
United States	150
Great Britain (England and Scotland).....	117 to 130
Germany	101
Norway	80
France	79½
Spain	70
Sweden, Belgium and Switzerland.....	61 to 70
Bohemia and Hungary.....	31
Russia	27
Portugal	27
Holland	27
Ireland	27
Italy	27
Austria-Hungary	27

Of all the above countries probably Italy consumes less meat per capita than any other.

As a nation the United States leads all others in the production of meat. The table presented herewith shows that the United States produces one third the world's supply of beef. The United States also produces more than one half the pork and one seventh of the mutton of the

MEATS OF ALL KINDS CONSUMED IN THE UNITED KINGDOM.

Average Annual Consumption.

DATE	Home Tons	Foreign Tons	Total Tons	Home per head Pounds	Foreign per head Pounds	Total per head Pounds
1868-70.....	1,267,000	123,699	1,290,699	91.81	8.06	100.77
1878-80.....	1,284,000	452,158	1,736,158	84.25	29.66	113.91
1888-90.....	1,354,984	560,241	1,915,225	81.62	33.76	115.38
1891-93.....	1,425,662	636,719	2,062,381	83.72	37.45	121.17
1894-96.....	1,388,817	759,637	2,148,454	79.51	43.44	122.95

The above table shows that the per capita consumption of meat in Great Britain is steadily on the increase.

MECCA

world. Not only does this nation produce more meat than any other country, but the per capita consumption of meat is greatest:

WORLD'S CONSUMPTION OF MEAT, 1895.

	Tons
United Kingdom	1,880,000
France	1,250,000
Germany	1,720,000
Russia	2,270,000
Austria	1,160,000
Italy	370,000
Spain	430,000
Portugal	100,000
Sweden	160,000
Norway	70,000
Denmark	80,000
Holland	100,000
Belgium	160,000
Switzerland	120,000
Danubian States	380,000
Greece	70,000
Europe	10,320,000
United States	3,950,000
Canada	250,000
Australia	450,000
Argentina	280,000
Total	15,200,000

The accompanying table is interesting as showing the relative amounts of beef, mutton and pork consumed in a few of the principal countries:

DISTRIBUTION OF ANNUAL PER CAPITA CONSUMPTION OF MEATS IN 1898.

	Beef lbs.	Mutton lbs.	Pork lbs.	Total lbs.
United Kingdom	63	32	35	130
France	43	10	26½	79½
Germany	43	3½	54½	101
Belgium	36	2½	31½	70

Only about one third of the beef consumed in Great Britain is produced there. It is a significant and striking fact that 25 years ago only one tenth of the meat used there was imported, and now the United States furnishes by far the greater part of their foreign meat, British ranking second, and British North America third. Williams has conclusively shown that the importation of American and other foreign beef and mutton has materially reduced the London wholesale price of these meats. His statement is here reproduced:

Average wholesale price of beef in London markets:

1876-80 from 5¼d. to 8 d. per pound.
1895 from 2½d. to 6¼d. per pound.

Average wholesale price of mutton in London markets:

1876-80 from 7½d. to 9 d. per pound.
1895 from 2½d. to 7½d. per pound.

Since 1893 the imports of meat into Great Britain have nearly doubled. In 1893, 465,000 tons, and in 1901, 919,000 tons were imported. The annual per capita consumption of foreign meat in 1893 was 37½ pounds, while in 1901 it was 49½ pounds. The total value of meat products exported from the United States in 1901 was \$186,106,037. Meat production is one of the leading industries of the farms in Iowa, Illinois, Missouri, Indiana, and Ohio. In fact wherever corn thrives there we find meat production an important industry. Corn is undoubtedly more largely used in meat production than any other feed. The problem of economic meat production in the United States is largely a question of the best method of utiliz-

ing corn and its by-products. There is a gradual and apparently necessary and certain change, just beginning, which will have an important bearing upon beef production in the United States. With the closing of many ranges in the range country which have hitherto furnished a high percentage of stockers and feeders which have been finished on the corn belt, or at any rate, upon corn grown in the corn belt, the problem presents itself, where are cattle feeders to look for their future supply of feeding cattle? Everything points to the conclusion that ultimately more of the cattle fatted for the market on the high priced lands in the corn belt will be bred and reared there. In other words the entire process of beef production will necessarily be carried on by the majority of cattle men. As it is, about 85 per cent of the native beef cattle marketed in Chicago have been previously bought as feeders and finished by cattle feeders who do not breed or rear the cattle they feed. The tendency in meat production at present is to put live stock in marketable condition and market them at an earlier age. This system involves better bred animals, more liberal feeding and a large use of nitrogenous feeds.

HERBERT W. MUMFORD,
Professor of Animal Husbandry,
University of Illinois.

Mecca, mēk'a, or Makka, Arabia, the holiest city of Islam, the capital of the province of Hedjaz, Asiatic Turkey, about 49 miles due east of Jiddah, its port on the Red Sea, with which it has telegraphic communication. The Mohammedans call it Umm-al-Kora, 'Mother of Cities,' and it derives its sanctity from having been the birthplace of Mohammed. The city stands in a narrow, sandy valley, enclosed by barren hills from 200 to 500 feet high, and is supplied with water from the mountains to the east by an aqueduct built in the 9th century, by Zubaidah, wife of Haroun-al-Raschid. The great mosque Beitu 'l'ah (House of God) or El-Haram (The Inviolable), enclosing the Caaba (q.v.), the Moslem 'holy of holies,' occupies a central square which divides the city into the northern upper, and the southern lower towns. The unpaved streets are wider than is usual in oriental towns, and the houses of stone, often three stories high, are lighted with windows looking on the street, giving them an occidental appearance. The stationary population is about 60,000, but the city is large enough for more than three times that number, and is annually filled at the time of the Hadj or pilgrimage to the Caaba, when apartments in almost every house are rented to strangers. This pilgrimage customary among the Arabs in early and idolatrous ages, and subsequently enjoined by Mohammed on all his followers, is the foun-

dation of Mecca's fame, and the only source of the inhabitants' wealth and occupation.

The Meccāwī, or inhabitants of Mecca, are, with the exception of a few Hedjāzī Bedouins, all strangers by birth or parentage. They are, in fact, settlers or children of settlers, attracted hither by the love of gain, and as they care nothing for learning, the colleges of Mecca have fallen to decay, and the libraries, once rich, have disappeared. Mecca during the pilgrimage becomes for three or four months in the year the greatest market in the East.

The pilgrims converge upon the holy city from three directions; those coming from the south are Mohammedans from Oceanica, Java, Sumatra, Indo-China, India, Turkestan, and southern Persia, who pass into the Red Sea through the Strait of Bab-el-Mandeb and on to Jiddah the port of Mecca; the northern branch of the pilgrims, north Persians, Turcomans and people from Asia Minor and European Turkey, go southward to the holy city both by the land and sea routes; the third stream is from the west, Egyptians, Moroccans, Algerians, Tunisians, and Turks, who reach Jiddah through the Suez Canal. For years past the average number of pilgrims passing through the Suez Canal to Jiddah has been 16,000, but this number is sometimes greatly exceeded; the number in 1901 was 26,000, and in 1902 was over 40,000. The northern pilgrims, however, are only a small part of those who annually convene at Mecca. The total number every year exceeds 100,000, practically all of whom are present at the fête of Bairam. The Sherifs of Mecca, direct descendants of Mohammed, are now a numerous and widely spread body. They all wear the same costume, priding themselves on the green robe which marks their descent. These nobles, as they may be called, elect the Sherif of Mecca, and their choice is formally confirmed by the Ottoman Sultan. Ptolemy mentions Mecca under the designation of Macoraba. The Wahabees took it in 1803; but in 1833 it was given up to Mehemet Ali, whose son Ibrahim was made Sheik el Haram.

Méchain, Pierre François, pē-ār frān-swā mā-shān, French astronomer; b. Laon, France, 16 Aug. 1744; d. Castellon, Spain, 20 Sept. 1805. He became a mathematical tutor and devoted himself to the study of astronomy in his spare moments. In Paris he gained the interest of the astronomer Laland, who assisted him to a governmental position, in which he was engaged in the survey of the French coast and in astronomical observations. The Academy of Sciences elected him a member in 1782, and in 1785 he was editor of *'Connaissances des Temps,'* in which appear some of his most valuable scientific papers. He was commissioned by the National Convention in 1791, in company with Delambre, to measure the arc of the meridian between Dunkirk and Barcelona. The results of the calculations made failed to satisfy him because of a slight discrepancy and though now appointed a director of the conservatory at Paris he persuaded the board of longitude to commission him to measure the arc between Dunkirk and the Balearic Isles, but died of fever in Spain while on his mission. See Delambre (*Histoire de l'Astronomie au dix-huitième Siècle.*)

VOL. 10—32

Mechanical Cashier, The, an American invention, patented in 1902; a mechanical, automatic apparatus for shops and stores, that receives money, places it beyond the reach of the operator or salesman, records the transaction and the number of the operator who makes it, stamps the cash check with the amount, totalizes and makes change. At the top of the machine is a row of openings, through which the money is put into the machine, a separate opening of suitable size and shape being provided for each denomination of coin or bill. Mounted behind each opening is a wheel, around the circumference of which is a series of pockets which receive the money placed in the machine. Each pocket takes but one coin or bill. Below each opening is a lever appropriately marked. When money is put into a pocket, the corresponding lever is pushed down. The wheel devoted to this particular denomination revolves sufficiently to bring the pocket below (which is always empty), in position behind the opening, the pocket containing the money being no longer accessible to the operator. Over the wheels is a glass cover which allows the contents of the pockets to be readily seen, and the amount of the purchase is registered on the keyboard. The sales ticket is slipped into the machine, and the operator turns the handle at the side, whereupon, simultaneously and automatically, it follows that (1) the exact amount of change is delivered from the machine; (2) the particulars of the sale are printed on three different parts of the sales ticket, and one part of it is clipped off and deposited in a locked drawer; (3) the particulars of the sale are also printed on a record tape within the machine; (4) the amount of the sale is included within a total, recorded by dials in front of the machine; (5) the depressed keys are returned to their normal position. While the functions which the machine performs are themselves complicated, the mechanism itself consists of the simplest mechanical movements, and no ordinary use of the machine can impair the perfection with which all of its parts operate. All parts of the machine are locked until a key is inserted, so that a clerk cannot operate it without the machine recording his number, and no one, not provided with a key, can tamper with the machine, or disturb its contents.

Mechanical Movements and Appliances. All mechanical appliances and devices employed to convert power into motion, or to transmit that motion from one point to another for mechanical purposes are technically designated "mechanical movements." For example—the mechanism of a watch, consisting of springs which supply the power or motive energy, and the wheels which transmit that power in a regulated manner to move the hands around the dial plate, is termed the "movement" of the watch.

Mechanical motion is either simple or compound. Simple motions are of three kinds: (1) "straight translation," (2) "simple rotation," and (3) "helical." All of them may be continuous or reciprocating accordingly as their duration is definite or indefinite, respectively; while continuous motion may also be uniform, or it may be accelerated. Oscillatory motion is reciprocating simple rotation, while helical motion of indefinite duration is always reciprocating.

MECHANICAL MOVEMENTS

"Compound motions" are obtained by combining any two or more of the simple motions, and are usually referred to under the name of the particular device employed, or according to the method of its application.

"Pendulum motion" is the oscillatory motion of a body in the arc of a circle, the body being attached to a rod which vibrates to and fro from a fixed axis. In the ideal simple pendulum consisting of a body attached to a string without weight, and vibrating from the point of suspension without resistance of any kind whatever, a material body once set in motion would continue to vibrate to and fro forever, since the tension of the string, like the resistance of the plane, will always be equal to one component of the weight, and in both cases will be exerted at right angles to the direction of motion, and, therefore, will not affect the velocity of the body.

Under these conditions it has been noted (1) that the time of a vibration of a pendulum through short arcs is independent of the lengths of the arcs, and that when the length of the arc is constant, as in the case of clock devices, the times of vibration are equal; (2) that when the force of gravity is constant, as is the case at any given point on the surface of the earth, the time of vibration varies directly as the square root of the length of the pendulum, so that, if a pendulum of a given length vibrates in one second, a pendulum one quarter as long will vibrate in $\frac{1}{2}$ second, and one four times as long will vibrate in 2 seconds; (3) that when the length of the pendulum is constant, the time of a vibration varies inversely as the square root of the force of gravity; and (4) that when the time of vibration of two pendulums at different points on the surface of the earth is equal, their lengths vary directly as the force of gravity.

While these relations give direct methods for determining the proper lengths of pendulums for clocks at different stations, and for comparing the values of the force of gravity at different latitudes, or at different heights above sea-level, the practical utilization of pendulum motion is always by means of some form of "compound pendulum," which, on account of its mechanical construction, consists of an indefinite number of particles of material which are joined together rigidly, and vibrate from a fixed axis, and the length of such a pendulum is equal to the length of a simple pendulum which would vibrate in the same time. This length is found by determining the distance between the "axis of oscillation" and the "axis of suspension" of the pendulum. See special article on PENDULUM.

"Perpetual motion" is a continuous or incessant motion supposed to be attainable by a mechanical device with inherent motive energy, and therefore, which when once set in motion is capable of continuing that motion indefinitely or perpetually. Such a device or machine, if practicable, might be termed a "perpetual movement."

Mechanical force is derived from natural sources by prime motors or generators such as steam, gas, and hydraulic engines, water-wheels, windmills, dynamos, and storage batteries, and is used to perform mechanical work by transmission and application, by machines consisting of mechanical movements embodying the principles of the so called "mechanical powers," namely, (1) the "lever"; (2) "wheel and axle"; (3)

"toothed wheels" or "wheel gearing"; (4) "pulley"; (5) "inclined plane"; (6) "wedge"; and (7) "screw." Of these, the wheel and axle and the various systems of wheel gearing are simply modifications of the lever, and the wedge and the screw are modifications of the inclined plane; while the action of the pulley is based upon the prime principle of reduplication, which depends on the fact, that when transmitting a force the tension of a string or rope is the same at every point. See special articles in this encyclopedia under the respective headings.

By means of such movements, the machines of which they form a part are enabled to transmit or to transform mechanical force and apply it with a certain amount of mechanical advantage. By transmission, a force applied at one point is made to act at another with a change in its direction, if necessary. By transformation, a force may be changed in its intensity so as to raise a weight much greater than that of the machine, or it may be employed to impart to the weight a greater velocity than that of the force itself. It is to be clearly understood, however, that machines cannot create force—they are merely the means by which force is utilized.

Under the laws of statics the work performed by a machine is estimated by the height to which a weight is raised, or the amount of resistance overcome in a definite distance. This relation may be expressed by the proportion—"the force is to the weight or resistance as the distance through which the weight is raised or the resistance is overcome, is to the distance through which the force acts."

Machines, therefore, may be applied in three ways: (1) where a small force is applied to lift a large weight, or to overcome a great resistance; this represents a mechanical advantage—a gain of power with a loss of velocity; (2) where an increase in the velocity is required, and represents a mechanical disadvantage—increased velocity being gained at the expense of power; (3) where only the transmission of the force from one point to another, or a change in its direction is required, in which case the force is equal to the weight or resistance, and the application is merely convenient.

These relations of the power and weight, or resistance, exist under the assumption that the machines are frictionless, and that all the power is expended in raising the weight or in overcoming the resistance with, theoretically, no limit to the mechanical advantage that may be gained by the use of machines made up of suitable combinations of movements; but, practically, there are other resistances, due to the weight of the various parts of the machine and the important element of friction, which use up a portion of the power so that the actual amount of work done by a machine is somewhat less than the amount theoretically expected of it. The ratio of the actual to the theoretical amount of work performed by a machine is its "modulus" or efficiency, and to increase this efficiency is the direct object of the use of a particular mechanical movement, rather than some other, in the construction of a machine. A simple but very comprehensive example is afforded by the various forms of water lifts. The mechanical advantage gained by the use of the modern force pump over the older form of windlass, and the primitive bucket and rope, or bucket and hook-pole,

MECHANICAL MOVEMENTS

is too clear to require an elaborate analysis.

Movements embodying the principle of the lever are of three classes: (1) those in which the fulcrum is situated between the power and the weight; (2) those in which the fulcrum is at one end of the lever arm with the weight nearer to it than the power; and (3) those in which the fulcrum is at the end with the power nearer to it than the weight.

Lever of the first order.

$$P = \frac{W \times y}{x}, \quad W = \frac{P \times x}{y}$$

In the first, if the weight is nearer to the fulcrum, there is a mechanical advantage—illustrated by the crowbar, which on account of the great difference in the length of its arms, is advantageously used to overcome great resistances. Scissors and nippers are double levers of this class. If the power is nearer to the fulcrum, there is a mechanical disadvantage, and if the weight and the power are at an equal distance on either side of the fulcrum, the power is equal to the weight and gives an arrangement similar to the ordinary balance.

The distinction between the gain of power

Lever of the second order.

$$P = \frac{W \times y}{(y+x)}, \quad W = \frac{P \times (y+x)}{y}$$

and the loss of velocity, and the reverse of these conditions, as depending upon the position of the fulcrum, is exemplified by the shears used for cutting metal, and those used for cutting cloth, respectively. In the former, short blades with long handles overcome a great resistance slowly; while in the latter, long blades operated by short handles, move quickly.

In the second class there is always a mechanical advantage. The wheelbarrow is an example

Lever of the third order.

$$P = \frac{W \times (y+x)}{y}, \quad W = \frac{P \times y}{x+y}$$

of the single lever. The fulcrum is at the centre of the wheel, the weight acts downward at the centre of gravity of the load, and the power is applied at the ends of the handles. A hinged

nut-cracker is an example of a double lever of this kind.

In the third class there is always a mechanical disadvantage; but, great rapidity of movement is obtained. The human forearm is an example of a single lever of this class. The fulcrum is at the elbow-joint, the weight acts downward at the hand, and the power is applied obliquely by a tendon from the biceps muscle attached near the elbow. A pair of tongs is an example of a double lever of this class.

Fig. 1.—Toggle-Joint.

$$\frac{\text{Power}}{R} = \frac{2}{\tan. \phi}$$

In the toggle-joint, a movement composed of two levers hinged together at (a) Fig. 1, with the end at (b) free to turn on a fixed pivot, while the end at (c) is free to move in the direction (ac), there is a great mechanical advantage

FIG. 2.

$$\frac{\text{Power}}{W} = \frac{r}{R}$$

especially when the levers are nearly in a straight line. It is frequently employed for raising the covers of carriages, and also with great efficiency in stone crushing machinery. (For other examples of lever movements see articles in this encyclopedia under the titles—BALANCE, TESTING MACHINES, WATCH, and WEIGHING MACHINES.

The wheel and axle consists of two cylinders of different sizes rigidly connected together and turning about a common axis. The larger cylinder is called the wheel and the smaller the axle. The power is applied to the end of a rope wound around the wheel and the weight is raised by a rope wound around the axle, see Fig. 2. It is essentially a form of lever, and "the power is to the weight lifted as the radius of the axle is to the radius of the wheel." The principle is applicable to all forms of hoisting machines, steering gear of ships, fusee clock and watch movements, etc. The differential or "Chinese" windlass employs two axles of different diameters, see Fig. 3. A rope passing under a movable pulley is wound around the large axle, and unwound around the smaller, so that the upward

MECHANICAL MOVEMENTS

movement of the weight supported by the pulley is very slow, and therefore, the mechanical advantage very great.

FIG. 3.

$$\frac{\text{Power}}{W} = \frac{a-b}{2R}$$

Wheel gearing consists of trains of two or more gear wheels the teeth of which interlock so that a force applied to one is communicated to the others. With a loss of speed there is a mechanical advantage, but a gain in velocity is at the expense of power, and constitutes a mechanical disadvantage. As a rule, "the moment of the power is to the moment of the weight as the number of teeth in the power wheel is to the number of teeth in the weight wheel."

Trains of toothed wheels are employed in derricks and cranes for lifting heavy weights, and in the back-gears of large turning lathes where a gain in power is required. They are also used extensively in the works of clocks and watches, but in such cases the relation of the power to the weight is not considered since the desideratum is the relative velocity of the axes of the successive wheels. The rack and pinion movement consists of a straight toothed-bar the teeth of which interlock with the teeth of a gear wheel which when turned by a handle or screw-head moves the bar up and down, or back and forth. A familiar example is the arrangement usually employed to move the tube of a microscope up and down.

The axial motions of wheels may be communicated to each other by belts as well as by gear wheels, with or without a change of velocity. Their operation depends upon the friction of the contact surfaces, and the velocities of the two axes are in inverse ratio of the radii of the wheels, while the mechanical advantage is the direct ratio as in the case of gear wheels.

In the case of the cone-pulley, Fig. 4: when the belt passes over the smallest wheel of the lathe shaft and over the largest wheel of the power shaft, the velocity of the axis of the lathe will be the greatest and its power to overcome resistance the least while a reversal of the belt arrangement just stated will give exactly the op-

posite results in the movement and power of the lathe. For other applications of the principle see special article entitled WHEEL GEARING.

FIG. 4.

The pulley, another modification of the lever, gives a mechanical advantage under certain conditions. (See special article entitled PULLEY.) Although the theoretical relation of the power to the weight is not attained in practice since serious resistances due to friction and to the stiffness of the ropes have to be overcome, it is a very useful mechanical appliance and is extensively employed in connection with the wheel and axle, or with gear wheels, in the machinery of derricks and cranes, and also forms an important part of a ship's rigging.

The inclined plane is simply a rigid plane inclined to the horizon at an angle, and upon which a weight may be supported by a force acting in a definite direction. (See special article entitled INCLINED PLANE.) The relation of power to weight depends upon the direction of action of the supporting force. When the force acts along the plane, "the power is to the weight

Sliding Weight.

$$P = (W \times \sin \phi) + \text{friction}$$

FIG. 5.

Rolling Weight.

$$P = \frac{W \times h}{b}$$

as the height of the plane is to its length." When the force acts horizontally, "the power is to the weight as the height of the plane is to the base." The principle is applied in arrangements by which boxes and barrels are pushed up from the ground and loaded on wagons, cars, etc. It was probably applied in the machinery employed to handle the great blocks used in the building of the Egyptian pyramids. It is more familiarly exemplified in the case of any mountain highway, or that of an up-grade railroad. It is to be clearly understood, however, that the use of the principle does not diminish the amount of work to be performed since that amount remains the same for a given vertical height at any angle of inclination. See Fig. 5.

MECHANICAL MOVEMENTS

The wedge, sometimes considered as a combination of two inclined planes placed base to base, consists of a five-sided solid. The two adjacent sides which meet in the edge are rectangles, the two opposite sides are triangles, and the back is a rectangle. Fig. 6. The power

FIG. 6.

$$P = 2R \sin \phi$$

acts in a direction perpendicular to the back, and the resistances are felt in the same plane perpendicular to the sides. Under these conditions the mechanical advantage increases as the angle of the wedge decreases — "the power being equal to twice the resistance into the sine of the angle of the wedge." This relation, however, has but little practical value since the resistance due to the friction is very great. The principle is used in many forms of cutting tools such as the knife, chisel, axe, and plane. For working in comparatively soft materials, the angle is kept small and the edge sharp; but, for harder ma-

FIG. 7.

$$P = \frac{W \times \text{pitch}}{2 \times \text{radius} \times 3.1416}$$

terials the angle is increased. Metal planing tools have very large angles, ranging from 60° to 80°. When the wedge is employed for cleaving wood, the cohesion and friction combined

produces so great a resistance that the force is applied in the form of a blow from a heavy body, and the resulting strain is equal to the force of the blow multiplied by the length of the wedge divided by its width. See special article entitled WEDGE.

The screw is essentially an inclined plane wound spirally around a cylinder, in the form of a rectangular or a triangular shaped groove. Fig. 7. When used, it works in a nut the parts of which are complementary to and fit into those of the screw. Either the nut or the screw may be made stationary. The power is applied to a lever arm at the end of the screw, its direction of action being at right angles to the axis of the screw, and therefore, imparting to it a turning motion which is, however, transformed by the resistance between the screw and the nut into a forward rectilinear motion parallel to the axis. Since this resistance is felt at every point of contact between the screw and the nut perpendicularly to their common surface, "the power is to the weight as the distance between the threads is to the circumference described by the power." The principle is applicable to many machines used to raise great weights, or to exert heavy pressures. Jack-screws for raising buildings, and screw presses used for various purposes, are familiar examples. (For examples of the application of the principle in the propelling of ships, see article entitled SCREW PROPELLER, and for examples of its application in water lifts, see special article entitled PUMPS and PUMPING MACHINERY, and also special article entitled SCREW.) Theoretically, the amount of mechanical advantage that may be gained by increasing the length of the lever arm, or by decreasing the distance between the threads, is unlimited; but, practically, the element of friction reduces the amount of the advantage to such an extent that the efficiency of the simple screw is small. A much greater mechanical advantage is obtained from the "differential screw." In this form, a large screw turns in a fixed nut, and a smaller screw of lesser pitch turns within it. The power is applied to the large screw and the resistance is felt by the smaller, so that while the larger descends, the smaller ascends, and the actual motion of the object moved is the resultant of these two opposite velocities, and slower than

FIG. 8.

that obtainable from the simple form. Fig. 8, shows a differential movement in which a screw (a) works in a nut (f) fixed to the wheel (b) but turning freely in a bearing (g) in the Standard (c) which prevents any lateral motion. The screw shaft is fixed to the wheel (d). The driving shaft (h) carries the pinions (k) and (m) which drive the wheels (d) and (b) at

MECHANICAL MOVEMENTS

unequal velocities so that the screw travels according to the difference of velocity. For working purposes, "the power is to the weight as the difference of the distances between the threads of the two screws is to the circumference described by the lever arm. For example of endless screw, see *Worm-gearing* in article entitled *WHEEL GEARING*.

The principle is advantageously applied to instruments used for making minute measurements. In the "micrometer screw" used for this purpose, the relation in the velocity of motion of the parts is the point considered, and not that of the power to the weight. For example: Suppose a screw is grooved with 100 threads to the inch, and that the circumference of the circle constituting its head is graduated into 100 parts. It is obvious that one complete revolution of the screw would advance one one-hundredths of an inch, and that if the head of the screw was equipped with a fixed index so that it could be turned through one one-hundredths of a revolution, the advance of the screw would be one ten-thousandths of an inch—the smallest interval measurable by that particular arrangement. Such screws with very fine threads, and therefore of very slow motion, are used as measuring devices, directly or indirectly, in many forms of physical apparatus.

The various forms of mechanical movements embodying the principles of one or more of the mechanical powers already described are so innumerable that a detailed description of them is impracticable within the scope of this article; but they are classified as follows into several important groups according to the general purposes for which they are used.

"Transmission of power appliances," consisting of ropes, belts, and various forms of gears, pulleys, etc.

"Measurement of power appliances and devices," used for determining velocities, pressures, weights, number, and quantities, such as brakes, counters, dynamometers, gauges, indicators, meters, planimeters, testing machines, and weighing machines.

"Steam power appliances," comprising boilers, locomotives, locomotive engines, oscillating engines, rotary engines, steam engines, steam turbines, valves and valve-gears, parallel motion gears, governors, and other engine devices.

"Steam appliances," such as injectors, steam pumps, condensers, separators, traps, and valves.

"Motive power machines," such as gas engines, gas producer engines, gasoline engines, valve-gear and appliances, and connecting rods and heads.

"Hydraulic power appliances and devices," consisting of various forms of water-wheels, water-motors, turbines, pumps, syphons, water-lifts, ejectors, hydraulic or water rams, meters, indicators, pressure regulators, valves, pipe joints, filters, hydraulic presses, and hydraulic metal working machinery such as riveters, rail benders, and punches.

"Air power appliances," devices and apparatus consisting of air compressors, air pumps, air water-lifts, barometers, bellows, blowers, blow-pipes, and compressed-air tools such as pneumatic drills, hammers, riveters, and shearing machines. Also, gauges, ventilators, and musical instruments.

"Electric power and construction appliances" such as generators, motors, wiring devices, con-

trolling and measuring devices, lighting arrangements, electric furnaces, heaters, fans, search-lights, and drilling machines.

"Navigation appliances" used for operating steamships, sailing vessels, and yachts, such as sails, rope knots, block and tackle, paddle wheels, screw propellers, steering gear, anchors, windlasses, capstans, cranes, etc.

"Road appliances," used in the construction of roads, highways, and railroads, such as scrapers, rollers, excavators, vehicles, motor carriages, bicycles, tricycles, motor adjuncts, wheels, road gates, lamps, etc.

"Gearing," consisting of rack and pinion devices, spiral, elliptical, and worm gears, differential and stop-motion gears, and epicyclical and planetary trains.

"Motion and controlling devices," consisting of ratchets and pawls, cams, and volute cams, cranks and variable cranks, intermittent and stop motions, wipers, shafts, couplings, and gyroscopes.

"Horological apparatus and devices," mainly used for measuring time, such as spring and pendulum clocks, watch and chronometer movements, electric clocks, and sundials.

"Mining machinery and appliances," such as quarrying and cutting machines, borers, drills, valves, blowers, ventilators, safety lamps, hoisting drums, conveyors, crushers, pulverizers, hydraulic nozzles, presses, air-blast and magnetic separators, steam shovels, dredges, haulage appliances, furnaces, and automatic dumps.

"Mill and factory appliances," such as hangers, shaft bearings, ball bearings, steps, couplings, universal and flexible couplings, speed gears, shop tools, screw threads, hoists, stampmills, saws, punches, shears, bending machines, grinding machines, cotton presses, looms, knitting machines, etc.

"Engineering construction appliances," such as mixing machines, testing machines, stump and pile pulling machines, block and tackle, hoisting machines, tackle hooks, pile drivers, automatic dumps and dumping cars, stone grips, derricks, conveyors, timber splicers, metal welding devices, tools, wood preserving apparatus, cable carriers, dams and embankments, escalators and moving platforms, gigantic wheels, high structures and buildings, roof and bridge trusses, trestles, and bridges.

"Agricultural machines and implements," such as plows, tethering hooks, wash boilers, washing machines, mowers, grain harvesters, threshing machines, cream separators, refrigerating machinery, cold storage houses, refuse crematories, silos, kilns, ovens, and furnaces.

"Drafting devices," such as dividers, dotting pens, parallel rules, curve delineators, tram-mels, ellipsographs, pantographs, etc.

"Tools," hand and machine, such as saws, chisels, mallets, planes, borers, etc.

"Perpetual motion devices," consisting of various forms of hydraulic, hydrostatic, and magneto-electric apparatus.

Bibliography.—For descriptions of a great variety of special movements, appliances, and devices, consult the works on the subject by Hiscok, Rheile, Ruleau, and Spon, also the special articles on the various forms of appliances enumerated under the general classes stated in this article.

MECHANICAL TERMS

Mechanical Terms. Words, compound words, and short phrases, having definite meanings other than those of ordinary usage, and specifically applicable to the use of tools and other mechanical appliances; to the construction and operation of machines; and to the methods employed and the manipulations required in the working and manufacture of the various kinds of materials used and the articles employed for engineering, structural, and other industrial purposes.

A great many of these terms have been in use from the very beginning of the present period of industrial and manufacturing development, and are satisfactorily employed at the present time according to their original significance; but the creative mechanical effort of the last 25 years has either developed or produced so great a variety of mechanical devices and machines that the mechanical terminology has been expanded to include a much greater number of terms, which are more or less unfamiliar to every one excepting those by whom they are habitually used in the execution of the particular line of work to which they are applicable.

Furthermore, the specializing methods of modern manufacturing systems, involving the restricted use of special terms, has not only tended to develop a class of one-sided workmen who are unquestionably skillful in their special lines of work and deplorably poor if not absolutely deficient in all other lines; but, the use of such methods has tended to increase the ever-widening gulf which separates any one class of workmen from the rest, by eliminating the necessity of a mutual knowledge of the special terms used in allied processes, by the special classes of workmen employed therein.

At the present time the number of mechanical terms amounts to several thousands. Eliminating those of a more or less fanciful character, and also those employed in individual shops, the terms having definite meanings capable of universal or wide application probably exceed 12,000 in number, the great majority of which are employed in the metal manufacturing and metal working industries.

A superficial examination of this terminology conveys the impression that a definite classification of the various terms would be either impossible or quite difficult, but a closer inspection shows that they may be very conveniently divided into several general classes according to the character of the work, machines, and structures to which they are applicable, as follows:

(1) Terms applicable to the processes and methods employed in the production of raw materials and rough work, and in the preparation of rough work for subsequent finishing operations; (2) Terms applicable to the methods, processes, and machines employed in the working of suitably prepared raw material into the form of simple articles, into the parts of complex machines, and into structural shapes in general; (3) Terms employed in the work connected with the preliminary and final erection of machines, engines, and structures; (4) Terms used for the purpose of describing special forms of mechanical appliances and mechanical movements according to their field of application; (5) Terms employed in operating the various classes of engines and machines; (6) General terms employed in connection with the execution of mechanical and structural engineering work;

and (7) Terms employed in connection with the use of the tools and appliances, and the application of the various methods and processes, in the reproductive arts.

In considering the matter of the application of technical terminology, it is well to prescribe marked lines of demarcation between the terms employed in connection with the different kinds of work, as for example—between the terms applicable to mechanical work and those employed in connection with electrical work. As a rule, the distinction is quite clear, but when the terms are used for the purpose of describing appliances, devices, and apparatus, the line of demarcation becomes somewhat indistinct, and the precise meanings of the terms require careful consideration.

One of the most interesting examples of the varied technical application of a common term is that afforded by the use of the word "damper." It is familiarly known as a plate, valve, cover, or other suitable contrivance for regulating the amount of draught in the flues of a furnace or boiler. As a specific mechanical term it is applied to the "dash-pot" or small cylinder which forms a portion of the engines of the Corliss type, in which they act as a "buffer-case" and prevent the too sudden closing of the steam and exhaust valves. As an electrical term it is applied to a metallic cylinder which is placed in such a manner that it nearly or entirely encompasses the iron core of an induction coil for the purpose of effecting a variation in the intensity of the current produced in the secondary battery. As a term employed in musical construction and operation, it is applied to the strip of felt or other soft material employed in a piano-forte for the purpose of modulating the vibration of the strings.

A more varied technical application obtains in the case of the common word "pitch." As used in connection with mechanical work it refers to the distance between the centres of two adjacent teeth on a gear-wheel, to the distances between bolts, rivets, and boiler stays, or similar parts arranged equidistantly. Also, to the inclination or rake of the teeth of saws, to the angle at which a plane-iron is set in its stock, and to the height or angle of a roof-truss. As an electrical term it refers to the successive corresponding conductors on the armature of a dynamo and the number of coils advanced in making end-connections between the coils of an armature winding divided into segments. It is also applied to designate the frequency of a tone vibration produced electrically. As a musical term it refers to a succession of tone vibrations.

The character of a technical term or the class of work to which it belongs is usually very clearly indicated by the textual matter on any particular subject, but in the case of mechanical and electrical terms when the distinction is not obvious, the special character of a term may be ascertained only by the nature of the power generated, controlled, or applied.

WILLIAM MOREY, JR.,
Consulting Mechanical Engineer, New York.

Mechanics (*μηχανή*, a machine), or **DYNAMICS**, the science that treats of forces (*δύναμις*, force), and of the motions produced by them. The notion of a force, as evinced to the senses as a push or pull, is common to all, but the notion of force as that which produces or destroys motion, which is the proper definition of force, is modern, and is to be ascribed to Newton, the chief founder of the science. It is a familiar fact that two opposite pushes or pulls may neutralize each other's effects, and thus fail to produce motion, we then speak of them as forces in *equilibrium*. The portion of Mechanics that treats of forces in equilibrium is denoted by the term *Statics* (root *στα*, stand), contrasted with which we have the subject of *Kinetics* (*κινέω*, to set moving), which deals with the effects of forces in acting to produce motion in bodies. Since we can distinguish motion only in matter, the laws of motion involve the essential properties of matter, so that Dynamics is a branch of Physics—indeed, its most fundamental branch, for it is the effort of physicists to reduce all explanations of physical phenomena to descriptions of matter in motion.* Nevertheless, as in geometry, instead of dealing with actual substance, we make abstraction and conceive of points, lines, and surfaces apart from the substance in which they lie, so we may make abstraction and consider the motion of points, lines, or geometrical configurations, quite apart from any matter or physical properties. This geometry of moving configurations or geometry of space and time is generally distinguished by the name of *Kinematics* (*κίνησις*, motion), and is included under treatments of Dynamics only for convenience, as it is impossible to make dynamical investigations except in kinematical terms.

The ancients knew but little of Mechanics, and what they did know belonged exclusively to Statics. Archimedes was familiar with the principle of the lever and of the pulley. Leonardo da Vinci generalized the principle of the lever, and Stevinus (1548–1620) demonstrated the principle of the inclined plane and of the composition of forces. Varignon clearly enunciated the principle of moments, and also of the composition of forces. Galileo, in the course of his investigations on the inclined plane, came to a recognition of a particular case of the Principle of Virtual Work, which was made general by Daniel Bernoulli. These are the chief names in the development of Statics. The beginnings of Kinematics were made by Galileo, who determined the laws of falling bodies, and introduced the fundamental idea of acceleration. Huygens, in his *Horologium Oscillatorium*,¹ published in 1673, examined in detail the laws of the pendulum, introduced the ideas of moment of inertia, of the center of oscillation, and of kinetic energy. Most important of all was the work of Newton, who in his *Principia Philosophiæ Naturalis* (1687) not only universalized the idea of force, and introduced the notion of *mass*, but laid down the exact definitions and principles from which it has never been necessary to depart. Since the work of Newton the chief names have been d'Alembert, Lagrange, and Hamilton,

who have given us methods of great generality and convenience, but without changing in any essential the principles laid down by Newton.

1. STATICS.—Although the principles of Statics may be logically deduced from those of Kinetics by assuming all velocities to be zero, it is simpler to follow the historical method and treat statics first, since we may dispense with the idea of time, and thus with the preliminary study of kinematics. We begin by assuming the identical nature of all forces. For instance, the effect of any force may be neutralized by a pull on a string fastened to the point at which the force is applied. The tension on a string is produced by equal and opposite pulls on its two ends, and it may be cut anywhere, if at the cut end is applied a force equal to the one previously applied to the end. Such a force may be produced by the weight of any body hanging from the end of the string. But as a weight always acts vertically downward, while forces may act in any direction, we may suppose the string carried over a smooth pulley with horizontal axis, whose effect is assumed to be merely to change the direction of the string without changing its tension. Thus any force in any direction may be equilibrated by the tension of a string produced by a certain weight. Two forces are equal when they are equilibrated by the same weight. Two weights found to be equal (by equilibration), when hung from the same string, produce double the tension produced by one, and thus forces may be measured in terms of a single weight. A force, having magnitude and direction, may be geometrically represented by a line parallel to it, and of a length proportional to its magnitude. To this line an arrow-head may be attached to indicate the sense of the direction of the force. We may now enunciate the principle, capable of experimental verification, that when two forces, represented by *AB*, *AC*, Fig. 1, are applied at the same material point

FIG. 1.

A, they may be replaced by a single force whose direction and magnitude are represented by the diagonal *AD* of the parallelogram formed on the sides *AB*, *AC*. (The direction of the arrows must be observed.) This is the principle of the *Parallelogram of Forces*. Obviously it may be replaced by the equivalent statement that if we form a triangle by placing at the extremity *B* of one of the lines representing the forces the initial point of the line representing the other force, *BD*, and complete the triangle, the line drawn from the initial point of the first to the terminal point of the second line will represent the *resultant* of the two forces, that being the term applied to the single force which replaces their effect. The original forces *AB*, *AC*, are said to be the *components* of *AD*. From the properties of the parallelogram, $AB \sin(\angle BAD) = AC \sin(\angle CAD)$, so that the magnitudes of the components are inversely proportional to the sines of the angles they make with the resultant. Obviously the

* *Utinam cetera naturæ phenomena ex principiis mechanicis eodem argumentandi genere derivare liceret.* Newton, *Preface to Principia*.

MECHANICS

two forces may be equilibrated by a force equal but opposite to the resultant, so that if we draw AE equal and opposite to AD (Fig. 2) the three

FIG. 2.

forces AB , AC , AE will be in equilibrium. As the angles BAD and BAE are supplementary, their sines are equal, similarly DAC and CAE ; consequently we have $\frac{AB}{\sin(CAE)}$

$= \frac{AC}{\sin(BAE)}$, and in turn considering each of the three forces as equilibrating the other two we get the theorem that the magnitudes of three forces in equilibrium are proportional to the sines of the angles lying opposite them respectively. This may be experimentally verified as in Fig. 3, where weights P , Q are hung

FIG. 3.

from strings passing over pulleys, and united at O to a string carrying a weight R . If a parallelogram be drawn on lengths proportional to P , Q , its diagonal will be vertical, and proportional to the weight R . A convenient form of the experiment is one in which the three strings are horizontal, and O is the center of a horizontal circular table, on whose rim the three pulleys may be placed, their relative positions being read off on a graduation of the edge of the table.

Obviously, by a reversal of the previous process, a given force may be resolved into components in any two given directions, as only one parallelogram can be drawn on a given diagonal, whose sides have given directions. If these directions are at right angles to each

FIG. 4.

other, as in Fig. 4, OP is the component of OF in the direction OA , and OQ the component

in the direction perpendicular thereto. The length OP is called the *projection* of OF in the direction OA , and we have $OP = OF \cos(\angle POF)$. Having found the resultant of two forces applied at a common point, we may compound this resultant with another force, and so on, the simplest rule of procedure being by an extension of the triangle method above, that is, apply the initial point of each line representing a force to the terminal point of the preceding line; then the line drawn from the first initial point to the last terminal point will represent the resultant. The slightest consideration will show that the resultant is independent of the order in which the forces are compounded. This construction is known as the *polygon of forces* (Fig. 5). It is ob-

FIG. 5.

viously not restricted to forces lying in the same plane.

In order to deal analytically with the composition of forces, it is convenient to assume three rectangular axes of coordinates, OX , OY , OZ (Fig. 6), and to resolve every force into

FIG. 6.

three components along each. Thus OF may be resolved into the mutually perpendicular components OY and OP , and OP may be resolved into OX and OZ . Calling the resultant F , the components respectively X , Y , Z , we have

$$\begin{aligned} X &= F \cos(\angle Fx), \\ Y &= F \cos(\angle Fy), \\ Z &= F \cos(\angle Fz); \end{aligned} \quad (1)$$

$$(2) \quad X^2 + Y^2 + Z^2$$

$$= F^2 [\cos^2(\angle Fx) + \cos^2(\angle Fy) + \cos^2(\angle Fz)] = F^2,$$

since the sum of the squares of the direction cosines of any line is identically equal to unity. Since the projection in any direction of any

broken line is the same as that of a straight line with the same ends, it is evident that the projection of any resultant is the same as the algebraic sum of the projections of all its components. Thus the analytical expression of the principle of the parallelogram or polygon of forces is, if F is the resultant, X, Y, Z its components along the axes,

$$\begin{aligned} X &= X_1 + X_2 + \dots X_n = \Sigma X, \\ (3) \quad Y &= Y_1 + Y_2 + \dots Y_n = \Sigma Y, \\ Z &= Z_1 + Z_2 + \dots Z_n = \Sigma Z. \end{aligned}$$

Any geometrical or physical quantity which possesses direction as well as magnitude, and is compounded according to the parallelogram law, and to which the whole of the above exposition applies, is called a *vector*, and the preceding process is called the *composition of vectors*.

2. A body so small that we may neglect the differences of position of its different points is called a *material particle*. The only principle necessary for the treatment of forces acting on such a particle is that for equilibrium the resultant of all the forces applied to it must vanish. The particle may be free or it may be subject to certain geometrical constraints, for instance, it may be obliged to move on a certain surface. Then there will be certain forces acting between the particle and the bodies causing the constraint, these forces being known as *reactions* due to the constraint. A surface is said to be smooth if the reaction between it and a particle is normal to the surface. Thus let F , Fig. 7, represent a force

FIG. 7.

applied to a particle of weight W , resting on an inclined plane making an angle α with the horizontal. Let F be parallel to the inclined plane. Then the three forces, W, F , and R , the reaction, normal to the plane, are in equilibrium. Writing these proportional to the opposite angles, as above, we obtain

$$(4) \quad \frac{F}{\sin \alpha} = \frac{R}{\cos \alpha} = \frac{W}{1},$$

which determine F and R in terms of W . The same equations are obtained by resolving in the direction of the tangent and of the normal to the plane. The equation $F = W \sin \alpha$ shows that the force required to sustain a particle on a smooth plane is to the weight of the particle in the same ratio as the height of the plane to its length, as was shown by Stevinus and Galileo.

In the problem just treated, it is evident that the resultant of the applied forces W and F is opposite to R , that is, is normal to the plane. Similarly for equilibrium on any smooth surface, it is necessary that the resultant of all the applied forces shall be normal

to the surface, for if it had any component parallel to the tangent plane this component would move the particle along the surface. Since the particle is constrained to move on a surface, there will be a relation between x, y, z , the coordinates of the particle, $\phi(x, y, z) = 0$, which is the equation of the surface; and since the direction cosines of the normal n are given by the equations

$$\cos(nx) : \cos(ny) : \cos(nz) = \frac{\partial \phi}{\partial x} : \frac{\partial \phi}{\partial y} : \frac{\partial \phi}{\partial z},$$

if X, Y, Z are the components of the resultant of the applied forces, we have as the condition for equilibrium

$$\cos(Fx) = \frac{X}{F} = \cos(nx), \text{ etc.,}$$

or

$$(5) \quad \frac{X}{\frac{\partial \phi}{\partial x}} = \frac{Y}{\frac{\partial \phi}{\partial y}} = \frac{Z}{\frac{\partial \phi}{\partial z}}.$$

If the surface is not smooth, the reaction between the particle and the surface is not normal, but there is a tangential component which is called *friction*. The force of friction is peculiar in that it cannot produce but only hinder motion, and in having its direction determined as opposite to the direction in which the other forces tend to make the particle move. The law usually assumed governing friction is that when motion is just about to take place the friction, or tangential component of the reaction, is proportional to the normal component, the factor of proportionality being a constant for two given substances, such as those composing the particle and plane, as above. Suppose that in the problem of the inclined plane the force F is the force of friction. Then we have $F = \mu R$, where μ is a constant for the given particle and plane called the coefficient of friction. Equations (4) then give

$$F = R \tan \alpha = \mu R, \quad \mu = \tan \alpha,$$

when the particle is just about to slide down. If the plane is any steeper than the value of α thus given, equilibrium is not possible. This angle is called the *angle of friction*.

3. Let us now consider a *rigid body*, that is, one composed of a continuous distribution of matter having the property that the distance between any two of its points is invariable, no matter to what forces it is subjected. It is evident that if equal and opposite forces, P and Q , Fig. 8, be applied to such a body at

FIG. 8.

two points A and B such that the line AB has the direction of the forces, no motion will be produced, for reasons of symmetry with respect to AB . Equilibrium is also independent of the position of B on the line AB .

MECHANICS

Consequently the force Q might be applied at A , where it might be compounded with P , giving a vanishing resultant. The principle that any force applied to a rigid body may be considered as applied at any other point in its line of direction is known as that of the *transmissibility of force*. As an application, if the lines of direction of three forces, P , Q , R (Fig. 9), intersect in a common point O , they

FIG. 9.

may be transferred to that point, and if they satisfy the conditions for the equilibrium of forces applied to a material particle, they will produce equilibrium of the rigid body.

Suppose we have two parallel forces P and Q applied at any points A , B , of a rigid body, (Fig. 10). If we apply at A and B any two

FIG. 10.

equal and opposite forces AR , BS , in the direction of AB , equilibrium will not be affected. Compound these respectively with AP , BQ , and transfer the resultants AC , BD , to the intersection of their lines of direction E and there resolve them into components in the original directions. From the equality of the parallelograms $EKFH$ and $APCR$, $ELGJ$ and $BQDS$, the components EJ and EH are equal and opposite, so that there remain only the components EK and EL , in the same direction, equal to the given forces AP , BQ , respectively. Thus the resultant of two parallel forces in the same direction applied to a rigid body is a force in the same direction equal to their sum. Obviously it may be considered as applied at any point O in the line EK . Suppose O to lie on AB . By similar triangles $\frac{AP}{AR} = \frac{OE}{AO}$, $\frac{BQ}{BS} = \frac{OE}{BO}$, and by division, since $AR = BS$, $\frac{AP}{BQ} = \frac{BO}{AO}$. Thus the distance of the

intersection of the line of direction of the resultant with AB from A and B is inversely proportional to the forces applied at those points. This is the principle of the lever, as known to Archimedes.

If the forces P and Q are the weights w_1 , w_2 of two particles, placed at AB , the point O is called the *center of gravity* of the two particles. It is also called the weighted mean point of points AB with the weights w_1 , w_2 . If we project the points A , B , O upon the coordinate axes, the projections of AO , BO , are in the same ratios as the lengths themselves; consequently if their coordinates are respectively x_1 , y_1 , z_1 , x_2 , y_2 , z_2 , $\bar{x}$, $\bar{y}$, $\bar{z}$,

$$\frac{\bar{x} - x_1}{x_2 - \bar{x}} = \frac{\bar{y} - y_1}{y_2 - \bar{y}} = \frac{\bar{z} - z_1}{z_2 - \bar{z}} = \frac{m_2}{m_1},$$

or

$$(6) \quad \bar{x} = \frac{m_1 x_1 + m_2 x_2}{m_1 + m_2}, \quad \bar{y} = \frac{m_1 y_1 + m_2 y_2}{m_1 + m_2}, \\ \bar{z} = \frac{m_1 z_1 + m_2 z_2}{m_1 + m_2}.$$

By a generalization, we obtain for the center of gravity of any number of points, or the resultant of any number of parallel forces,

$$(7) \quad \bar{x} = \frac{\sum mx}{\sum m}, \quad \bar{y} = \frac{\sum my}{\sum m}, \quad \bar{z} = \frac{\sum mz}{\sum m}.$$

If the two forces AP , BQ , are in opposite directions, instead of Fig. 10 we have the construction of Fig. 11, and the resultant is evi-

FIG. 11.

dently equal to the *difference* of the two components, while the point O lies outside the segment AB . We may say that in general the resultant is equal to the *algebraic* sum of the components. In Fig. 11, if AP and BQ are made more nearly equal, parallel, and *oppositely* directed forces applied to a rigid body cannot be replaced by a single resultant. Such a pair of forces is called a *couple*. The perpendicular distance between the two lines of direction of the members of the couple is called its *arm*. The product of the magnitude of either force by the arm of the couple is called the *moment* of the couple. The plane

MECHANICS

of the couple is the plane containing both forces. We have shown that a couple cannot be equilibrated by any single force, but it may be by another couple. This couple may be chosen in an infinite variety of ways. It may easily be shown by drawing the members of the second couple as about to be prescribed, and compounding the forces two and two, by the rules already given, that the equilibrating couple may be equilibrated by any of the following, and that the given couple may accordingly be replaced by: 1° An equal and parallel couple in any plane parallel to its own; 2° An equal couple turned about its point of symmetry; 3° A couple in the same plane having different arm and forces but the same moment. Thus all that characterizes a couple is the magnitude of its moment and the direction of the normal to the plane of the couple. The couple then behaves like a directed quantity, and may be symbolized by a line in the direction of the normal to its plane, whose length gives the magnitude of the moment. That couples are also compounded by the vector law is easily seen, for consider the forces of the two couples to be applied at two points AB in the line of intersection of their two planes. This can be done by bringing the couples to have the same arm. Let P_1P_2 (Fig. 12) be the

FIG. 12.

members of one couple, Q_1Q_2 those of the other. Compound P_1Q_1 by the parallelogram law to R_1 , P_2Q_2 to R_2 . These being equal, parallel, and oppositely directed, form a couple which, having the same arm as the original couples, has its moment proportional to R , that is, found by the parallelogram construction. If lines are laid off perpendicular to the three planes of AB and P, Q, R , respectively, and proportional to the three moments, they will also follow the parallelogram law. Thus a couple may be represented by a vector perpendicular to its plane. This vector we shall speak of as the *couple*, and shall disregard the resolution into two separate forces.

Let us now consider the effect of any number of forces applied at various points of a rigid body. At any point O (Fig. 13) apply two equal and opposite forces $P'P''$ equal and parallel to a force P applied at A . We thus have the force P' equal to P applied at O instead of at A , together with the couple PP'' . Similarly all the forces applied at other points may be considered applied at O , by introducing in each case a couple. All the forces at O may be compounded into a single resultant, and all the couples into a single couple. Thus the resultant of any number of forces applied to a rigid body is a single force together with a single couple. Evidently the resultant force

does not depend upon the position of the point O , while the resultant couple does. In

FIG. 13.

order to have equilibrium, both the resultant force and the resultant couple must vanish. In order to express these conditions analytically, we must find an expression for the moment of a vector about a given point, that is, the product of the magnitude of the vector by the length of the perpendicular dropped upon it from the given point. This moment is thus numerically equal to the area of the parallelogram formed with the given point as one corner and the given vector as one side. As plane areas may be projected on other planes by multiplying by the cosine of the dihedral angle between them, which is equal to the angle between their normals, it is evident that the area of the parallelogram, and hence the moment, may be represented by a vector perpendicular to its plane, as already shown for the moment of a couple. Thus it is only necessary to find expressions for the three projections of a moment. Let the vector F (Fig. 14), with components X, Y , be applied

FIG. 14.

at a point having the coordinates x, y . Its moment about the origin is equal to the area of a parallelogram having as adjacent sides lines drawn from the origin to points x, y and X, Y . This area is equal to $xyY - yX$. But this is the projection on the XY -plane of the area of the parallelogram on the lines from O to points x, y, z , and X, Y, Z . It therefore represents the Z -component of the required moment. Similarly the three components are obtained,

$$(8) \quad L = yZ - zY, \quad M = zX - xZ, \quad N = xY - yX.$$

The moment of a couple is the sum of the moments of its two members, and if X, Y is applied at x_1, y_1 , $-X, -Y$ at x_2, y_2 , we obtain for the moment of the couple

$$x_1Y - y_1X - x_2Y + y_2X = (x_1 - x_2)Y - (y_1 - y_2)X,$$

which evidently does not depend on the choice of the origin, but only on the vector F and the

MECHANICS

relative position of the two points of application, since only differences of x_1x_2 , y_1y_2 appear.

The analytical statement of the conditions for equilibrium of a rigid body is then

$$(9) \quad \begin{aligned} \Sigma X &= 0, \quad \Sigma Y = 0, \quad \Sigma Z = 0; \\ \Sigma(yZ - zY) &= 0, \quad \Sigma(zX - xZ) = 0, \\ \Sigma(xY - yX) &= 0, \end{aligned}$$

the first three expressing the vanishing of the resultant force, the last three the vanishing of the resultant couple. These principles suffice for the treatment of all problems concerning the equilibrium of a rigid body. For example, the extended principle of the lever follows from the theory of moments. Consider now the problem of a ladder standing on a smooth floor and leaning against a smooth wall (Fig. 15). The resultant of the weights

FIG. 15.

of all the parts of the ladder is a single force W applied at the center of gravity G . Besides this we have to consider the normal reactions R and S . Resolving vertically we find for equilibrium $W - R = 0$. Resolving horizontally there must be a force to balance S . Let this be P , applied at the lower end of the ladder. Then $P - S = 0$. This does not determine the value of P or S , but we may do this by taking moments about any point in the plane of the figure. If we choose the lower end of the ladder, P and R will have zero moment, and if l is the length of the ladder, α the inclination,

$$Sl \sin \alpha - (Wl \cos \alpha)/2 = 0, \quad S = \frac{1}{2}W \cot \alpha.$$

If the floor is rough, and P the friction, $P = \mu R$, $\mu W = S = \frac{1}{2}W \cot \alpha$, $\mu = \frac{1}{2} \cot \alpha$, and if α is less than the angle determined by this equation, the ladder will slip down.

4. All the principles of statics are comprised in the Principle of Virtual Work. The conception of work is equally important with that of force. Work is done when the point of application of a force moves, the amount of work being defined as the product of the magnitudes of the force and the distance moved by the cosine of the angle included by them. If F denote the force, D the displacement, the work is $FD \cos (FD)$. This *geometric* or *scalar product* of two vectors (not a vector, since it is not associated with direction, but merely with a number, or scalar) defined as the product of either by the projection on it of the other, is of much importance in our whole subject. The angle between two directions is given by the symmetric function of their direction cosines

$$\begin{aligned} \cos (FD) &= \cos (Fx) \cos (Dx) \\ &+ \cos (Fy) \cos (Dy) + \cos (Fz) \cos (Dz). \end{aligned}$$

Now if the projections on the axes of coordinates of the two vectors are

$$(10) \quad \begin{aligned} F_x &= F \cos (Fx), \quad F_y = F \cos (Fy), \\ F_z &= F \cos (Fz), \\ D_x &= D \cos (Dx), \quad D_y = D \cos (Dy), \\ D_z &= D \cos (Dz), \end{aligned}$$

we have

$$(11) \quad FD \cos (FD) = F_x D_x + F_y D_y + F_z D_z$$

as the analytic expression for the scalar product. If one of the vectors is taken as of unit length, the expression (11) gives us the value of the projection F_s of any vector F on any direction s ,

$$(12) \quad F_s = F \cos (Fs) = F_x \cos (sx) + F_y \cos (sy) + F_z \cos (sz).$$

It is easily proved that the work of the resultant of two forces in a displacement is the sum of the works of the components.

In the case of an infinitely small displacement dx, dy, dz , the work is

$$(13) \quad dW = F_x dx + F_y dy + F_z dz,$$

and if the point is moved along a curve the whole work is

$$(14) \quad W = \int (F_x dx + F_y dy + F_z dz),$$

where x, y, z, F_x, F_y, F_z are supposed given in terms of some parameter, so that the integration along the curve can be performed.

If some of the points of a system are not free, but constrained, a *virtual displacement* is one that is consistent with the constraints. Virtual work is work done in a virtual displacement. The *Principle of Virtual Work* states that in a system of forces in equilibrium the work done in an infinitesimal *arbitrary* virtual displacement vanishes. Let us apply this principle to a number of simple cases. First, two equal weights P hanging from a string over a fixed pulley are in equilibrium. If the system is displaced one weight falls as much as the other rises. For the one that falls the displacement is in the direction of the force, and the work is positive and equal to PD . For the one that rises the displacement is opposite to the direction of the force, and the work is negative and equal to $-PD$. The sum of these two quantities thus vanishes. In the case of a weight hanging from a movable pulley (Fig. 16), if the string on the left is

FIG. 16.

pulled up a distance D , the force T_1 does the positive work $T_1 D$; but from the geometry of the case the weight P rises a distance $D/2$ and the weight W accordingly does the nega-

tive work $-PD/2$. The whole work is zero, if $T = P/2$. But this is the condition of equilibrium as found by resolution, since the tensions T_1 and T_2 are equal and we must have $T_1 + T_2 - P = 0$. Consider a lever (Fig. 17)

FIG. 17.

carrying the weights P, Q at distances l_1, l_2 from the fulcrum. Then for equilibrium the principle of moments gives $Pl_1 = Ql_2$. But if the lever be turned through an infinitesimal angle α , the end A moves a distance downward $D_1 = l_1\alpha$ and the weight does the positive work $Pl_1\alpha$, while the end B rises a distance $D_2 = l_2\alpha$, and Q does the negative work $-Ql_2\alpha$. The whole work is zero if $Pl_1 = Ql_2$, which is the condition for equilibrium. In the case of the inclined plane (Fig. 7), if the particle is displaced a small distance d up the plane, the force F does the work Fd . The weight W does the negative work $-Wd \sin \alpha$, since its direction makes an obtuse angle with the displacement. The reaction does no work, since it is perpendicular to the displacement. The whole work is therefore zero if $F = W \sin \alpha$. But this is the condition of equilibrium. The principle of virtual work is particularly convenient, since it enables us to leave the reactions out of account, since they do no work when the displacements are virtual. As a further example let us consider the equilibrium of a particle whose coordinates are x, y, z on a surface $\phi(x, y, z) = 0$, under the action of forces whose resultant is X, Y, Z , omitting the reaction. Since the displacement is virtual, we must have $\phi = 0$ during the displacement, so that

$$(15) \quad d\phi = \frac{\partial \phi}{\partial x} dx + \frac{\partial \phi}{\partial y} dy + \frac{\partial \phi}{\partial z} dz = 0.$$

The principle of virtual work says that for equilibrium

$$(16) \quad Xdx + Ydy + Zdz = 0$$

for any virtual displacement, that is, one in which dx, dy, dz are not independent, but satisfy (15). Multiplying (15) by an undetermined factor λ and adding to (16), we have

$$(17) \quad \left(X + \lambda \frac{\partial \phi}{\partial x} \right) dx + \left(Y + \lambda \frac{\partial \phi}{\partial y} \right) dy + \left(Z + \lambda \frac{\partial \phi}{\partial z} \right) dz = 0.$$

Both conditions are satisfied if we determine λ so that

$$(18) \quad X + \lambda \frac{\partial \phi}{\partial x} = Y + \lambda \frac{\partial \phi}{\partial y} = Z + \lambda \frac{\partial \phi}{\partial z} = 0,$$

or eliminating λ ,

$$(19) \quad \frac{X}{\frac{\partial \phi}{\partial x}} = \frac{Y}{\frac{\partial \phi}{\partial y}} = \frac{Z}{\frac{\partial \phi}{\partial z}}.$$

But this is the condition (5) that the resultant is normal to the surface, and in fact only in this way can there be equilibrium, according to the definition of a smooth surface.

For a rigid body, a possible displacement is one in which all the points receive equal and parallel displacements, so that dx, dy, dz are the same for all. We then have

$$(20) \quad \Sigma(Xdx + Ydy + Zdz) = dx \Sigma X + dy \Sigma Y + dz \Sigma Z = 0.$$

If this is to be true for arbitrary values of dx, dy, dz we must have

$$(21) \quad \Sigma X = \Sigma Y = \Sigma Z = 0,$$

which are three of the conditions for equilibrium already found. A second possible displacement of a rigid body is one in which it is turned through an angle $d\theta$ about the Z -axis.

FIG. 18.

Let us introduce polar coordinates, so that $x = r \cos \theta$, $y = r \sin \theta$. Then in the rotation, r being constant,

$$dx = -r \sin \theta d\theta = -y d\theta, \quad dy = r \cos \theta d\theta = x d\theta, \quad dz = 0.$$

Consequently the virtual work is

$$(22) \quad \Sigma(Xdx + Ydy + Zdz) = d\theta \Sigma(xY - yX).$$

If this is to vanish whatever $d\theta$ we must have

$$(23) \quad \Sigma(xY - yX) = 0.$$

But this is one of the conditions for equilibrium (9) already found, and the two others are similarly found by rotating about the other axes.

Suppose now that we have any number of points $x_1, y_1, z_1, \dots, x_n, y_n, z_n$, acted on by any forces, $X_1, Y_1, Z_1, \dots, X_n, Y_n, Z_n$, and subject to any number of constraints,

$$(24) \quad \begin{aligned} \phi_1(x_1, y_1, z_1, \dots, x_n, y_n, z_n) &= 0, \\ \phi_2(x_1, y_1, z_1, \dots, x_n, y_n, z_n) &= 0, \\ &\vdots \\ \phi_k(x_1, y_1, z_1, \dots, x_n, y_n, z_n) &= 0. \end{aligned}$$

Then the equation of virtual work,

$$(25) \quad \sum_{r=1}^n (X_r dx_r + Y_r dy_r + Z_r dz_r) = 0,$$

must hold for any changes of the coordinates which satisfy the conditions,

$$d\phi_1 = \sum_{r=1}^n \left(\frac{\partial \phi_1}{\partial x_r} dx_r + \frac{\partial \phi_1}{\partial y_r} dy_r + \frac{\partial \phi_1}{\partial z_r} dz_r \right) = 0,$$

$$(26) \quad \dots \dots \dots$$

$$d\phi_k = \sum_{r=1}^n \left(\frac{\partial \phi_k}{\partial x_r} dx_r + \frac{\partial \phi_k}{\partial y_r} dy_r + \frac{\partial \phi_k}{\partial z_r} dz_r \right) = 0.$$

MECHANICS

Multiplying these equations in turn by multipliers $\lambda_1, \dots, \lambda_k$, and adding to (25),

$$(27) \quad \sum_{r=1}^n \left[\left(X_r + \sum_{s=1}^k \lambda_s \frac{\partial \phi_s}{\partial x_r} \right) dx_r + \left(Y_r + \sum_{s=1}^k \lambda_s \frac{\partial \phi_s}{\partial y_r} \right) dy_r + \left(Z_r + \sum_{s=1}^k \lambda_s \frac{\partial \phi_s}{\partial z_r} \right) dz_r \right] = 0,$$

which is satisfied for all virtual values of $dx_1, \dots, dz_n$, if we take

$$(28) \quad \begin{aligned} X_r + \sum_{s=1}^k \lambda_s \frac{\partial \phi_s}{\partial x_r} &= 0, \\ Y_r + \sum_{s=1}^k \lambda_s \frac{\partial \phi_s}{\partial y_r} &= 0, \quad r=1, 2, \dots, n. \\ Z_r + \sum_{s=1}^k \lambda_s \frac{\partial \phi_s}{\partial z_r} &= 0. \end{aligned}$$

From these equations, eliminating the k multipliers $\lambda_1, \dots, \lambda_k$, we have $3n-k$ equations of equilibrium.

5. KINEMATICS.—Let us now consider questions of motion. The velocity of a point is defined as the limit of the space Δs described by it to the time of description Δt , when both decrease indefinitely,

$$(29) \quad v = \lim_{\Delta t \rightarrow 0} \frac{\Delta s}{\Delta t} = \frac{ds}{dt}.$$

Since displacements are compounded as vectors, the resultant of a displacement AB (Fig. 1), and another BD being AD , if the two displacements take place in the same time, the velocities are also proportional to the three lines, so that velocities are vectors, compounded by the parallelogram. Accordingly a velocity may be represented by its components along the coordinate axes. Its direction being that of the tangent to the path, its direction cosines are those of the tangent, $\frac{dx}{ds}, \frac{dy}{ds}, \frac{dz}{ds}$. Consequently, its components are

$$(30) \quad \begin{aligned} v_x &= v \frac{dx}{ds} = \frac{ds}{dt} \frac{dx}{ds} = \frac{dx}{dt}, \\ v_y &= v \frac{dy}{ds} = \frac{ds}{dt} \frac{dy}{ds} = \frac{dy}{dt}, \quad v_z = v \frac{dz}{ds} = \frac{ds}{dt} \frac{dz}{ds} = \frac{dz}{dt}. \end{aligned}$$

Also,

$$(31) \quad \begin{aligned} v^2 &= v_x^2 + v_y^2 + v_z^2 \\ &= \left(\frac{dx}{dt} \right)^2 + \left(\frac{dy}{dt} \right)^2 + \left(\frac{dz}{dt} \right)^2 = \left(\frac{ds}{dt} \right)^2. \end{aligned}$$

Similarly, the projection of a velocity in any direction is the velocity of the projection of the point on a line having that direction.

If a point moves in a plane it may be convenient to introduce polar coordinates r, ϕ . If the point moves from A to B (Fig. 19), a distance Δs in the time Δt , dropping a perpendicular AC upon the radius OB , the displacement may be resolved into AC and CD , equal to $r \Delta \phi$ and Δr respectively, and accordingly

the velocity may be resolved into the components in those directions,

$$(32) \quad v_\phi = \lim_{\Delta t \rightarrow 0} \frac{r \Delta \phi}{\Delta t} = r \frac{d\phi}{dt}, \quad v_r = \lim_{\Delta t \rightarrow 0} \frac{\Delta r}{\Delta t} = \frac{dr}{dt}.$$

Also,

$$(33) \quad v^2 = v_\phi^2 + v_r^2 = r^2 \left(\frac{d\phi}{dt} \right)^2 + \left(\frac{dr}{dt} \right)^2 = \left(\frac{ds}{dt} \right)^2,$$

as may also be seen from the expression for the arc in polar coordinates. The components

FIG. 19.

v_r and v_ϕ are called the radial and transverse components of the velocity respectively, while $\frac{d\phi}{dt}$ is called the angular velocity of the radius.

The area of the triangle OAB being $\frac{1}{2} r^2 d\phi$, the radius vector sweeps over area at the rate $\frac{dS}{dt} = \frac{1}{2} r^2 \frac{d\phi}{dt}$, but since the area is also equal to one half the product of AB by the perpendicular on it from O , dividing by dt we find this rate of area description to be equal to one half the *moment of the velocity* about O . Using the formula (8) for moment of a vector, we have

$$(34) \quad \frac{dS}{dt} = \frac{1}{2} r^2 \frac{d\phi}{dt} = \frac{1}{2} (xv_y - yv_x) = \frac{1}{2} \left(x \frac{dy}{dt} - y \frac{dx}{dt} \right),$$

which may be easily verified by passing directly from rectangular to polar coordinates.

6. If the velocity of a point varies we define the *acceleration* as the limit of the increment of velocity to the time in which it takes place. We may consider the numerical change,

$$(35) \quad \lim_{\Delta t \rightarrow 0} \frac{\Delta v}{\Delta t} = \frac{dv}{dt} = \frac{d^2 s}{dt^2},$$

or the vector change. If AB (Fig. 20) denote the velocity at a time t , AC the velocity at

FIG. 20.

the time $t + \Delta t$, the vector increase of velocity is BC , and the acceleration is the limit of the ratio of BC to Δt . Obviously it may be resolved into any components, which are the corresponding components of BC each divided by Δt . In the triangle ABC , since the velocities AB and AC have the directions of the tangents to the path at the respective instants

the angle between them is the angle $d\tau$ between the two consecutive tangents. It is obvious that the direction of the infinitesimal side BC may be anything whatever, and that accordingly the direction of the acceleration is totally unrelated to that of the velocity, that is of the tangent to the path. Resolving along the axes, we find for the components of the accelerations

$$(36) \quad a_x = \frac{dv_x}{dt} = \frac{d^2x}{dt^2}, \quad a_y = \frac{dv_y}{dt} = \frac{d^2y}{dt^2},$$

$$a_z = \frac{dv_z}{dt} = \frac{d^2z}{dt^2},$$

from which

$$(37) \quad a^2 = \left(\frac{d^2x}{dt^2}\right)^2 + \left(\frac{d^2y}{dt^2}\right)^2 + \left(\frac{d^2z}{dt^2}\right)^2.$$

Since the direction cosines of the tangent are the same as those of the velocity, v_x/v , v_y/v , v_z/v , we may use formula (12) to resolve the acceleration along the tangent,

$$(38) \quad a_\tau = (a_x v_x + a_y v_y + a_z v_z) / v$$

$$= \left(\frac{d^2x}{dt^2} \frac{dx}{dt} + \frac{d^2y}{dt^2} \frac{dy}{dt} + \frac{d^2z}{dt^2} \frac{dz}{dt} \right) / \frac{ds}{dt}$$

But differentiating equation (31) and comparing with (38), we find

$$(39) \quad a_\tau = \frac{d^2s}{dt^2}.$$

Thus the rate of increase of the numerical velocity is equal, not to the whole acceleration, but to its tangential component. This we call the tangential acceleration, and it is equal to the limit of DC (Fig. 20), divided by dt . The normal acceleration is easily obtained from the figure as the limit of BD divided by dt . But in the figure we have $BD = AB \cdot d\tau = v d\tau$, so that the normal acceleration,

$$(40) \quad a_n = v \frac{d\tau}{dt}.$$

Also, if ρ is the radius of curvature of the path, $ds = \rho d\tau$,

$$(41) \quad a_n = \frac{v}{\rho} \frac{ds}{dt} = \frac{v^2}{\rho}.$$

The normal acceleration is always directed toward the concave side of the path, and is called the *centripetal acceleration*.

We will now consider some of the most important cases of acceleration. If the motion is rectilinear, the velocity and the acceleration have always the same direction, but may vary in magnitude and in sign. After uniform motion, in which the velocity is constant and the acceleration zero, so that equal spaces are described in equal times, the simplest case is that of constant acceleration,

$$(42) \quad \frac{d^2s}{dt^2} = a = \text{const.}$$

Integrating we obtain

$$(43) \quad \frac{ds}{dt} = at + b,$$

where b is a constant representing the velocity

when $t=0$. Integrating again,

$$(44) \quad s = \frac{1}{2}at^2 + bt,$$

where s denotes the space described since $t=0$. Thus if the particle start from rest ($b=0$), it describes spaces proportional to the *squares* of the times of description. It was found by Galileo that bodies fall toward the earth according to such a law, and that in a given locality the value of the acceleration is the same for all bodies. The value of this acceleration of gravity is generally denoted by g . Comparing the velocity attained by a body falling from rest with the height, we obtain, by (43) and (44),

$$(45) \quad v = gt, \quad h = \frac{1}{2}gt^2, \quad v^2 = 2gh.$$

Conversely, if a body be thrown upward with a velocity v , it will reach the height h .

If we consider the motion of a body under gravity, but possessing a horizontal velocity as well as a vertical component, since there is no horizontal acceleration the horizontal velocity v_x is constant. Calling the vertical distance fallen z , the horizontal distance traversed x , we have

$$z = \frac{1}{2}gt^2, \quad x = v_x t,$$

and eliminating t we have the equation of the path, $z = \frac{1}{2} \frac{gx^2}{v_x^2}$, representing a parabola with the axis vertical. The velocity at any point and its inclination to the horizontal are found from

$$v_z = gt = \sqrt{2gz}, \quad v^2 = v_x^2 + v_z^2, \quad \tan \alpha = v_z/v_x.$$

If, on the other hand, the particle be projected upward with velocity v at an angle α with the horizontal, it will describe the same parabola, rising to the vertex in the time t and falling on the symmetrical half. This problem was also solved by Galileo.

Consider a particle revolving with constant velocity v in a circular path of radius r . Then since $s=vt$, by (39) we find that the tangential component of the acceleration vanishes. The normal component is given by (41) as v^2/r . Thus the acceleration is constant in amount and always directed toward the center. It is to be observed that although the numerical velocity is constant, the vector velocity is constantly changing its direction, hence the acceleration is not zero, but is perpendicular to the velocity. If we resolve the uniform circu-

FIG. 21.

lar motion into components parallel to given directions, for instance, if P (Fig. 21) is projected into Q and R lying on the axes OX , OY , and if P revolves with constant angular

velocity $\omega = \frac{d\phi}{dt}$, we have $\phi = \omega t$, $OQ = r \cos \phi = r \cos \omega t$, $OR = r \sin \phi = r \sin \omega t$. The rectilinear motion of either Q or R is called *simple harmonic motion*, or a *simple vibration*. It is evidently periodic, that is, it repeats after the interval $T = \frac{2\pi}{\omega}$. The number of vibrations in

unit of time, or the *frequency*, is $\frac{1}{T} = \frac{\omega}{2\pi}$. Since the acceleration of P is constant in magnitude, and always in the direction PO , its component along OX varies as $\cos \phi$, that is, as the distance OQ . In other words, a point describing a simple harmonic motion has an acceleration proportional to its displacement from the center of symmetry, and directed towards it. We may also consider harmonic motion analytically. If the acceleration is proportional to the displacement but opposite in direction, we shall have

$$(46) \quad \frac{d^2s}{dt^2} = -\omega^2 s,$$

where ω is a constant. The integral of this differential equation is

$$(47) \quad s = A \cos \omega t + B \sin \omega t = a \cos(\omega t - \alpha),$$

where A and B are arbitrary constants and $A = a \cos \alpha$, $B = a \sin \alpha$. The constant a is called the *amplitude*, while the angle α , called the *epoch*, depends simply upon the instant adopted from which to count the time. By taking for α the values 0° or 90° we obtain either $a \cos \omega t$ or $a \sin \omega t$.

If we compound two simple harmonic motions in lines at right angles to each other, if the amplitudes and periods are the same and the epochs differ by a right angle, the previous construction shows that we obtain uniform circular motion. If the amplitudes and epochs do not have this relation, we have

$$(48) \quad \begin{aligned} x &= a \sin(\omega t - \alpha) \\ &= a(\sin \omega t \cos \alpha - \cos \omega t \sin \alpha), \\ y &= b \sin(\omega t - \beta) \\ &= b(\sin \omega t \cos \beta - \cos \omega t \sin \beta). \end{aligned}$$

Solving for $\sin \omega t$ and $\cos \omega t$,

$$(49) \quad \begin{aligned} \sin \omega t &= \left(\frac{x}{a} \sin \beta - \frac{y}{b} \sin \alpha \right) / \sin(\beta - \alpha), \\ \cos \omega t &= \left(\frac{x}{a} \cos \beta - \frac{y}{b} \cos \alpha \right) / \sin(\beta - \alpha). \end{aligned}$$

Squaring and adding we eliminate t and obtain the equation of the path,

$$(50) \quad \frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{2xy}{ab} \cos(\alpha - \beta) = \sin^2(\alpha - \beta),$$

which represents an ellipse. The motion is called *elliptic harmonic motion*. The ellipse is evidently inscribed in a rectangle of sides $2a$, $2b$ (Fig. 22), and according to the values of $\alpha - \beta$ may have any shape, reducing to a straight line when $\alpha - \beta$ is zero or 180° . If the two harmonic vibrations are not of the same period, the resulting path belongs to a system of curves associated with the name of Lissajous. They may be easily constructed point by point, but the elimination of t will be

possible only if the periods have a common measure.

FIG. 22.

Suppose a particle subject to the constant acceleration of gravity to be constrained to move in a vertical circle of radius l (Fig. 23).

FIG. 23.

The component of the acceleration g in the direction of the tangent is $-g \sin \theta$, while the distance moved from the bottom of the circle is $l\theta$. We thus have the differential equation

$$(51) \quad \frac{d^2s}{dt^2} = l \frac{d^2\theta}{dt^2} = -g \sin \theta.$$

The solution of this equation requires elliptic functions, but if θ is small enough we may neglect the difference between the angle θ and its sine, so that the equation of motion is

$$(52) \quad \frac{d^2\theta}{dt^2} = -\frac{g}{l} \theta,$$

which is the same as the equation (46) of harmonic motion with $\omega^2 = g/l$. Accordingly the small vibrations of a pendulum are harmonic,

of the period $T = 2\pi \sqrt{\frac{l}{g}}$, which is independent of the amplitude of oscillation. The fact of this *isochronism* of the pendulum, or independence of the period from the amplitude, was discovered by Galileo, while the laws of uniform circular and of harmonic motion, and of the pendulum, were found by Huygens.

The latter also used the formula $g = \frac{4\pi^2 l}{T^2}$ to determine the value of g .

Let us now examine the consequences of the celebrated laws discovered by Kepler as governing the motion of the planets about the sun. The first law states that the areas swept over by the radius vector from the sun to a planet in equal times are equal. Calling the area S , $\frac{dS}{dt} = \text{const.}$ But differentiating the value of $\frac{dS}{dt}$ given in (34), we find

$$(53) \quad 2 \frac{d^2S}{dt^2} = x \frac{d^2y}{dt^2} - y \frac{d^2x}{dt^2} = x a_y - y a_x.$$

But this is the *moment* of the acceleration with respect to the origin, and if it vanishes, the acceleration must be directed toward the origin. The kinematical interpretation of the first law is then that the planets are accelerated toward the sun. The second law states that the planets describe ellipses about the sun as a focus. The equation of a conic section referred to its focus is

$$r = \frac{p}{1 + e \cos \phi}, \quad p = a(1 - e^2),$$

where a is the major axis, e the eccentricity. Now to resolve the acceleration along the radius vector, we multiply its components a_x , a_y , respectively, by the direction cosines of the radius vector, which are $\cos \phi$, $\sin \phi$. Differentiating the equations for change of coordinates $x = r \cos \phi$, $y = r \sin \phi$, twice, we have

$$\begin{aligned} a_x &= \frac{d^2x}{dt^2} = \frac{d^2r}{dt^2} \cos \phi - 2 \sin \phi \frac{d\phi}{dt} \frac{dr}{dt} \\ &\quad - r \sin \phi \frac{d^2\phi}{dt^2} - r \cos \phi \left(\frac{d\phi}{dt} \right)^2, \\ a_y &= \frac{d^2y}{dt^2} = \frac{d^2r}{dt^2} \sin \phi + 2 \cos \phi \frac{d\phi}{dt} \frac{dr}{dt} \\ &\quad + r \cos \phi \frac{d^2\phi}{dt^2} - r \sin \phi \left(\frac{d\phi}{dt} \right)^2, \end{aligned}$$

from which

$$(54) \quad a_r = a_x \cos \phi + a_y \sin \phi = \frac{d^2r}{dt^2} - r \left(\frac{d\phi}{dt} \right)^2.$$

Now by Kepler's first law,

$$2 \frac{dS}{dt} = r^2 \frac{d\phi}{dt} = \text{const.} = h, \quad \frac{d\phi}{dt} = \frac{h}{r^2}.$$

Changing the variable from t to ϕ ,

$$\frac{dr}{dt} = \frac{dr}{d\phi} \frac{d\phi}{dt} = \frac{h}{r^2} \frac{dr}{d\phi} = -h \frac{d}{d\phi} \left(\frac{1}{r} \right).$$

Differentiating by t ,

$$\frac{d^2r}{dt^2} = -h \frac{d^2}{d\phi^2} \left(\frac{1}{r} \right) \frac{d\phi}{dt} = -\frac{h^2}{r^2} \frac{d^2}{d\phi^2} \left(\frac{1}{r} \right).$$

From the equation of the path we obtain

$$\frac{1}{r} = \frac{1}{p} + \frac{e}{p} \cos \phi, \quad \frac{d^2}{d\phi^2} \left(\frac{1}{r} \right) = -\frac{e}{p} \cos \phi = \frac{1}{p} - \frac{1}{r},$$

from which

$$\frac{d^2r}{dt^2} = -\frac{h^2}{pr^2} + \frac{h^2}{r^3}, \quad a_r = -\frac{h^2}{pr^2}.$$

Thus the fact that the path is a conic section shows that the acceleration is inversely as the square of the distance from the focus. The negative sign shows that it is *toward* the sun.

The third law states that for different planets the squares of the times of description of the orbits are proportional to the cubes of the major axes. Since $2dS/dt = h$, if T is the time of a complete period hT is twice the area of the orbit.

$$hT = 2\pi ab = 2\pi a^2 \sqrt{1 - e^2}, \quad h^2 = \frac{4\pi^2 a^4}{T^2} (1 - e^2),$$

$$(55) \quad a_r = -\frac{h^2}{pr^2} = -\frac{h^2}{a(1 - e^2)r^2} = -\frac{4\pi^2 a^3}{T^2} \frac{1}{r^2}.$$

Now since a^3/T^2 is the same for all the planets, we see that the factor of $1/r^2$ in the accelera-

tion is the same for all the planets. These kinematical interpretations of Kepler's laws in terms of acceleration were given by Newton.

6. KINETICS. — The whole of our experience of dynamical phenomena was summed up by Newton in his *Axioms or Laws of Motion*, which are as follows:

I. *Every body persists in its state of rest or of uniform motion in a straight line, except in so far as it is compelled by impressed forces to change that state.*

The property of persistence thus defined is called *Inertia*. The law of inertia was recognized in a less definite way by Galileo, but Newton makes of it a criterion for the existence of force, and in fact implies that if a body is moving in any other way than uniformly in a straight line, that is, without acceleration, it is acted on by a force. The second law gives a positive definition of force.

II. *Change of motion is proportional to the moving force applied, and takes place in the direction of the straight line in which the force acts.*

In the explanation of this law, and in a corollary appended, Newton makes clear that it is intended to include the independence of effect of two simultaneous forces, and their composition by the parallelogram.

In his introductory definitions, Newton states what he means by quantity of motion, to which force is proportional, namely, the product of velocity by mass, or what is now called *momentum*, but the notion of mass is best introduced by the third law, which is perhaps the most important, as well as original, of the three.

III. *To every action there is always an equal and contrary reaction; or, the mutual actions of any two bodies are always equal and oppositely directed.*

If the force were measured by the acceleration alone, the accelerations of the two interacting bodies would be *equal and opposite*; this is not the case, but they are found to be proportional, with a factor of proportionality which is found to be always the same for two given bodies, no matter how they act on each other. For example, let them be connected by a string, and act on each other through its tension, or by an elastic cord whose length may vary. If for symmetry we write a factor for each acceleration,

$$(56) \quad m_1 \frac{d^2x_1}{dt^2} = -m_2 \frac{d^2x_2}{dt^2}, \quad m_1 \frac{d^2y_1}{dt^2} = -m_2 \frac{d^2y_2}{dt^2}.$$

$$m_1 \frac{d^2z_1}{dt^2} = -m_2 \frac{d^2z_2}{dt^2},$$

the factors m_1 , m_2 are called the *masses* of the bodies, and their ratio is determined by the ratio of the accelerations. Thus we may compare the mass of any body with that of a given body taken as a unit. The usual unit of mass is the pound or the gram.

By the introduction of the conception of mass and of momentum we pass from kinematics to kinetics, or dynamics proper. As long as we were concerned with one body at a time, like Galileo and Huygens, the notion of acceleration was sufficient, but when we deal with a number of bodies with mutual actions, the notion of force is necessary. The

terms on either side of equations (56) represent the forces, and the equations express the third law. The second law may now be stated by saying that force is the rate of change of *momentum*. The forces generally are known in terms of the positions of the bodies, and perhaps of their velocities, and when given by their components X , Y , Z as functions of these quantities, the equations

$$(57) \quad m \frac{d^2x}{dt^2} = X, \quad m \frac{d^2y}{dt^2} = Y, \quad m \frac{d^2z}{dt^2} = Z$$

are called the differential equations of motion.

Our kinematical examples of the previous section may now be dynamically interpreted. The fact that bodies fall with a common acceleration g shows that the forces with which they are moved towards the earth, or their weights, $W = mg$, are proportional to their masses. The unit of force, namely, that force which produces in a pound an acceleration corresponding to an increase of velocity of one foot per second in each second, has received the name of *poundal*. The weight of each pound is accordingly g poundals. The unit generally used by scientists is the force which produces in a gram the acceleration corresponding to an increase of velocity of one centimeter per second in each second. This force is called a *dyn*e, and the weight of a gram is g dynes. These units are called *absolute* units, as they do not depend on accidental circumstances of time or place, but are referred to three fundamental units, of time, length, and mass, the latter two of which are preserved in concrete standards, the former is preserved in the rotation of the earth. The more familiar *gravitation unit*, which we have used in the section on statics, and which is the *weight* of the pound or gram, is not absolute, since g varies at different parts of the earth, according to the formula

$$(58) \quad g = 980.62 - 2.6 \cos 2\lambda - .00003h,$$

where λ is the latitude, h the height above sea-level, and the units are the centimeter and the second. The weight of a body is accordingly variable, but its mass is invariable. For $\lambda = 45^\circ$, at sea-level we have

$$\text{Weight of pound} = 32.17 \text{ poundals,}$$

$$\text{Weight of gram} = 980.62 \text{ dynes.}$$

The popular usage of the term pound or gram to denote both a mass and a force is unfortunate, and should be avoided.

The fact that the weights of bodies are proportional to their masses was carefully tested by Newton by constructing pendulums of different materials, and finding that the acceleration, as determined by the time of oscillation, was independent of the substance.

The fact that a body moving uniformly in a circle has a centripetal acceleration v^2/r shows that it is acted on by a force towards the center (centripetal force) equal to mv^2/r . If the body, for instance, be revolved in a horizontal orbit on a whirling machine, and be held in place by a string, this string may be passed over a pulley and support a weight, so that we may thus make a comparison between the absolute dynamical measure of force and the gravitational statical one previously used. By repeating the experiment with another revolving

mass, we may compare the masses of two bodies by the process of comparing both with the same weight. This illustrates the dynamical comparison of masses. The usual statical method of comparison by a balance is actually a comparison of *weights*, and gives a correct comparison of masses because the value of g is the same at each pan. If we used a balance-beam so long that g differed sensibly at its two ends, equality of weights would not mean equality of masses.

Another simple illustration of the dynamical method of comparison of masses is furnished by Atwood's machine, by which the laws of falling bodies may be studied. Two masses, m_1 , m_2 , Fig. 24, are hung from a string passing

FIG. 24.

over a frictionless pulley. Since the distance moved up by one mass is equal to that moved down by the other, the velocities and accelerations of the two are equal and opposite. Each mass is acted upon by two forces, the tension of the string upwards and its own weight downwards. The tension is the same for both. Consequently we have for the acceleration a ,

$$m_1 a_1 = m_1 a = T - m_1 g,$$

$$m_2 a_2 = -m_2 a = T - m_2 g,$$

from which we obtain

$$a = \frac{m_2 - m_1}{m_2 + m_1} g;$$

that is, the acceleration is to that of a body falling freely as the difference to the sum of the masses. Thus by observing the acceleration the masses may be compared. In the usual use of Atwood's machine the difference of masses is produced by an extra weight, which is taken off at a certain height by a fixed ring, after which the two remaining equal masses travel with uniform velocity, and by the velocity generated the acceleration is determined.

The properties of harmonic motion show that a body acted upon by a force proportional to its displacement from a fixed point will execute a harmonic vibration. When a point has a position of equilibrium and is displaced therefrom, forces will in general be brought into play tending to restore it to its position, and these forces will depend upon the displacement. If the displacement be small enough, the forces will be approximately proportional to the displacement, hence the frequency of harmonic vibrations in nature. The vibration of the

pendulum or of a particle at the bottom of a bowl are examples.

From the generalization that all the planets are accelerated toward the sun with an acceleration $a = c/r^2$, where c is constant for all, Newton, putting the force equal to cm/r^2 , and seeing that the masses of the two interacting bodies, the sun and planet, must enter symmetrically, was led to assume $F = \gamma Mm/r^2$, and from the law of reaction this would also be the force urging the sun toward the earth. Thus he was led to the generalization of universal gravitation, namely, the statement that every mass in the universe attracts every other with a force proportional to the product of both their masses, and inversely to the square of the distance apart. (The number γ is the same for all, depending only on the units used.)

Newton tested this by comparing the acceleration of the moon due to the earth's attraction with the acceleration of a body at the earth's surface. Supposing the moon's orbit to be circular, of radius r and period T , its acceleration will be by (55) $a_m = 4\pi^2 r/T^2$. If the acceleration varies inversely as the square of the distance, at the surface of the earth, it will be

$$a_s = a_m \frac{r^2}{R^2} = \frac{4\pi^2 r^3}{R^2 T^2},$$

where R is the earth's radius.

Now we have

$$T = 27 \cdot 32 \text{ d} = 39,343 \text{ m.}, \quad 2\pi R = 4 \times 10^7 \text{ meters,} \\ r = 60R,$$

from which

$$a_s = \frac{2\pi \cdot 60^3 \cdot 4 \cdot 10^7 \text{ meters}}{(39,343 \cdot 60 \text{ sec})^2} \\ = 9.74 \frac{\text{meters}}{\text{sec}^2} = 974 \frac{\text{cm.}}{\text{sec}^2}.$$

This agrees well with the value of g from terrestrial observations, while more exact calculations give a still better agreement.

The value of the Newtonian constant, γ , or the number of dynes of attraction of two masses each of one gram, one centimeter apart, is $\gamma = 6.6576 \cdot 10^{-8}$.

A highly important contribution was made by d'Alembert, who made it possible to reduce every problem of dynamics to one of statics. If a system of particles be not free, they cannot move under the influence of given applied forces as they would if not constrained, but the reactions will cause them to move otherwise, as in the case of the masses in Atwood's machine. For another instance, consider two bullets fastened together by a string and thrown at random into the air. If free each would describe plane curves, namely, vertical parabolas. Under the influence of the tensions of the string which causes the constraint, they describe looped or tortuous paths. If we knew the actual paths and motions, we could find forces which would produce the same motions if the particles were free. These d'Alembert calls the effective forces and they are given by

$$X' = m \frac{d^2 x}{dt^2}, \quad Y' = m \frac{d^2 y}{dt^2}, \quad Z' = m \frac{d^2 z}{dt^2}.$$

D'Alembert's principle states that the actual applied forces, together with the reversed effective forces, would form a system in equilibrium.

If we express the equilibrium by means of the equation of virtual work, (25,) we obtain

$$\sum_r \{ (X_r - X'_r) \delta x_r + (Y_r - Y'_r) \delta y_r + (Z_r - Z'_r) \delta z_r \} = 0,$$

or

$$(58) \sum_r \left\{ \left(m_r \frac{d^2 x_r}{dt^2} - X_r \right) \delta x_r + \left(m_r \frac{d^2 y_r}{dt^2} - Y_r \right) \delta y_r + \left(m_r \frac{d^2 z_r}{dt^2} - Z_r \right) \delta z_r \right\} = 0.$$

This equation, given by Lagrange, was made by him the basis of all dynamics. Since the reactions would of themselves form a system of forces in equilibrium, they may be left out of the equation (58) of d'Alembert's Principle.

From the equation (58) we can deduce all the principles of dynamics. Suppose every particle is free, then all the virtual displacements, δx_r , δy_r , δz_r , are independent, and in order that the equation may hold for arbitrary displacements, we must have

$$(59) \quad m_r \frac{d^2 x_r}{dt^2} = X_r, \quad m_r \frac{d^2 y_r}{dt^2} = Y_r, \quad m_r \frac{d^2 z_r}{dt^2} = Z_r$$

for every r . But these are Newton's equations of motion.

If the particles be free or form a rigid system, a virtual displacement will be given when δx_r , δy_r , δz_r have the same values for all the particles. We may then remove these factors from the summation,

$$(60) \quad \delta x \left(\sum_r m_r \frac{d^2 x_r}{dt^2} - \sum_r X_r \right) + \delta y \left(\sum_r m_r \frac{d^2 y_r}{dt^2} - \sum_r Y_r \right) + \delta z \left(\sum_r m_r \frac{d^2 z_r}{dt^2} - \sum_r Z_r \right) = 0,$$

and if δx , δy , δz are arbitrary, this requires

$$(61) \quad \sum_r m_r \frac{d^2 x_r}{dt^2} = \sum_r X_r, \quad \sum_r m_r \frac{d^2 y_r}{dt^2} = \sum_r Y_r, \\ \sum_r m_r \frac{d^2 z_r}{dt^2} = \sum_r Z_r.$$

Now we have

$$(62) \quad \sum_r m_r \frac{d^2 x_r}{dt^2} = \frac{d^2}{dt^2} \sum_r m_r x_r = \left(\sum_r m_r \right) \frac{d^2 \bar{x}}{dt^2}, \\ \sum_r m_r \frac{d^2 y_r}{dt^2} = \frac{d^2}{dt^2} \sum_r m_r y_r = \left(\sum_r m_r \right) \frac{d^2 \bar{y}}{dt^2}, \\ \sum_r m_r \frac{d^2 z_r}{dt^2} = \frac{d^2}{dt^2} \sum_r m_r z_r = \left(\sum_r m_r \right) \frac{d^2 \bar{z}}{dt^2},$$

where $\bar{x}$, $\bar{y}$, $\bar{z}$ are the coordinates of the center of mass, which obviously coincides with what in the treatment of statics has been called the center of gravity. We thus find that the center of mass of a free system, or of a rigid body, moves as if all the forces of the system were applied at that point and all the mass were concentrated there. In particular if the system is exposed to no external forces, but only to its mutual actions, since these are equal and opposite in pairs, they destroy each other. Consequently the center of mass of such a system moves uniformly in a straight line. This applies to the solar system.

Under the same conditions, a rotation about an axis is a virtual displacement. Putting as in (22) $\delta x = -y\delta\theta$, $\delta y = x\delta\theta$, $\delta z = 0$, and dividing out $\delta\theta$, we have

$$(63) \sum_r m_r \left(x_r \frac{d^2 y}{dt^2} - y_r \frac{d^2 x}{dt^2} \right) = \sum_r (x_r Y_r - y_r X_r).$$

The quantity on the right is the z -component of the resultant moment of all the impressed forces, as in (9), (23), which will be denoted by the components L, M, N .

The quantity on the left may be written

$$\frac{d}{dt} \sum_r m_r \left(x_r \frac{dy_r}{dt} - y_r \frac{dx_r}{dt} \right).$$

The quantity whose derivative appears,

$$(64) H_z = \sum_r \left(x_r m_r \frac{dy_r}{dt} - y_r m_r \frac{dx_r}{dt} \right) = \sum_r (x_r m_r v_{yr} - y_r m_r v_{xr}),$$

is evidently the z -component of the resultant moment of momentum of all of the particles of which the system is composed. We thus have the principle that if we construct a vector H having the components H_x, H_y, H_z , where

$$(64) \begin{aligned} H_x &= \sum_r (y_r m_r v_{zr} - z_r m_r v_{yr}), \\ H_y &= \sum_r (z_r m_r v_{xr} - x_r m_r v_{zr}), \\ H_z &= \sum_r (x_r m_r v_{yr} - y_r m_r v_{xr}), \end{aligned}$$

in virtue of the equations

$$(65) \quad \frac{dH_x}{dt} = L, \quad \frac{dH_y}{dt} = M, \quad \frac{dH_z}{dt} = N,$$

the velocity of the extremity of the vector H , representing the moment of momentum of the system, is equal and parallel to the resultant moment of the impressed forces about the same point. This principle, with that of equations (61), suffices for the treatment of the motion of a rigid body. By putting all velocities equal to zero we obtain the conditions of equilibrium as in (9).

If in equation (58) we put for $\delta x_r, \delta y_r, \delta z_r$, the distances actually traversed by the various points in the actual motion in the interval dt ,

$$\delta x_r = \frac{dx_r}{dt} dt, \quad \delta y_r = \frac{dy_r}{dt} dt, \quad \delta z_r = \frac{dz_r}{dt} dt,$$

we obtain

$$(66) \sum_r m_r \left(\frac{d^2 x_r}{dt^2} \frac{dx_r}{dt} + \frac{d^2 y_r}{dt^2} \frac{dy_r}{dt} + \frac{d^2 z_r}{dt^2} \frac{dz_r}{dt} \right) dt - \sum_r \left(X_r \frac{dx_r}{dt} + Y_r \frac{dy_r}{dt} + Z_r \frac{dz_r}{dt} \right) dt = 0,$$

and we may write the sum of terms containing the accelerations as an exact derivative,

$$\frac{d}{dt} \sum_r m_r \left[\left(\frac{dx_r}{dt} \right)^2 + \left(\frac{dy_r}{dt} \right)^2 + \left(\frac{dz_r}{dt} \right)^2 \right] = \frac{dT}{dt}.$$

The quantity T whose derivative appears, which is one half the sum of the products of the mass of each particle by the square of its velocity, is the very important quantity called the *kinetic energy*. Integrating equation (66) between the limits t_0 and t_1 ,

$$(67) \quad T_1 - T_0 = \sum_r \int_{t_0}^{t_1} (X_r dx_r + Y_r dy_r + Z_r dz_r),$$

where T_0 and T_1 denote the values of T at the respective instants t_0 and t_1 .

The integral on the right is the work (14) done by all the applied forces during the motion. We thus obtain the principle that the increase of kinetic energy of a system is equal to the work done by the forces. Suppose now that the system be taken from one given configuration, where all the coordinates have given values, to a second, where they have other given values, the particles describing given paths, and they then be taken from the same initial configuration to the same terminal one, but by other paths. Two cases are to be considered. Either the work done by the forces depends upon the paths, or it is independent of the paths, depending only on the terminal configurations. If the integral

$$\int_{t_0}^{t_1} (X_r dx_r + Y_r dy_r + Z_r dz_r)$$

does not depend upon the path, it can be shown that every component of every force is the partial derivative of a single function $-W$ of all the coordinates, by the corresponding coordinates.

$$(68) \quad X_r = -\frac{\partial W}{\partial x_r}, \quad Y_r = -\frac{\partial W}{\partial y_r}, \quad Z_r = -\frac{\partial W}{\partial z_r}.$$

We then have

$$\sum_r \int_{t_0}^{t_1} (X_r dx_r + Y_r dy_r + Z_r dz_r) = W_0 - W_1,$$

and the equation (67) becomes

$$T_1 - T_0 = W_0 - W_1,$$

or

$$(69) \quad T_1 + W_1 = T_0 + W_0.$$

The sum of the two functions $T + W$ is then constant during the motion. As T is called the kinetic, W is called the *potential energy* of the system. Such systems are called *conservative systems*, and the above principle is called the principle of the *Conservation of Energy*. The notion of energy is of the greatest importance in dynamics. The principle was first used by Huygens and was generally stated by John and Daniel Bernoulli.

As an example of a conservative force we may take gravity. For a single particle we have $W = mgz$ (z being measured upward), so that the equation of energy is

$$\begin{aligned} \frac{1}{2}mv^2 + mgz &= \text{const.} = \frac{1}{2}mv_0^2 + mgz_0, \\ v^2 - v_0^2 &= 2g(z_0 - z) = 2gh. \end{aligned}$$

Accordingly the velocity attained by a falling particle does not depend on the form of the path, but only on the height fallen. This was known to Galileo, for bodies falling along the inclined plane or the arc of a circle. Forces acting according to the Newtonian law are also conservative.

We have now stated in summary fashion the principal theorems of *Mechanics*.—The scope of this article does not permit us to enter into the details of the various methods which arise for treating the more complicated problems, say of the motion of a rigid body. By means of the equations (65), however, we may form an idea of some of

the properties of such motions. We have seen that the center of mass moves as if the whole body were concentrated, and all the forces applied there. To find the motion of rotation we have to investigate the moment of momentum of a rigid body. If the body rotate about an axis with angular velocity $\frac{d\theta}{dt}$, we obtain the velocity of a point at a distance r from the axis by differentiating the equations $x = r \cos \theta$, $y = r \sin \theta$,

$$v_x = -r \sin \theta \frac{d\theta}{dt} = -y \frac{d\theta}{dt}, \quad v_y = r \cos \theta \frac{d\theta}{dt} = x \frac{d\theta}{dt},$$

and the moment of momentum is

$$H_z = \sum m_r (x_r v_{yr} - y_r v_{xr}) = \frac{d\theta}{dt} \sum m_r (x_r^2 + y_r^2).$$

The quantity $K = \sum m_r (x_r^2 + y_r^2) = \sum m_r r^2$ is called the *moment of inertia* of the body with respect to the axis. Suppose the axis is horizontal, and the body influenced only by gravity. The resultant of the weights of all the particles of the body is a force $W = Mg$ applied at the center of mass, which is, say, at a distance h from the axis, the plane through it and the axis making an angle θ with the vertical. Then the moment of all these forces about the axis is $N = Mgh \sin \theta$, and we have the equation of motion

$$(70) \quad \frac{dH_z}{dt} = K \frac{d^2\theta}{dt^2} = -Mgh \sin \theta.$$

This is the same as that of a simple pendulum of length $l = K/Mh$, which is called the length of the equivalent simple pendulum. A point at a distance l from the axis and in line with it and the center of mass is called the *center of oscillation*. This problem of the so-called compound pendulum was solved by Huygens, who also showed that if the body be suspended from a parallel axis through the center of oscillation the period would be the same.

If a rigid body move in any manner with one point fixed, it may be shown that its motion at any instant may be described as a rotation with a certain angular velocity about a certain axis. All the particles of the body are then moving in various directions tangent to circles with planes parallel to each other, but owing to lack of symmetry the direction of the resultant moment of momentum has no simple relation to the direction of the axis.

FIG. 23.

As the motion goes on the direction of the axis changes in the body, and so does the direction

of the moment of momentum. Thus the phenomenon is a complicated one, and can be dealt with only by lengthy analysis. If, however, the axis of rotation is an axis of symmetry, as in the case of the axis of a symmetrical top, Fig. 25, it is evident that the particles may be grouped in symmetrical pairs, m_1, m_2 , Fig. 26, so that the moments of momentum H_1, H_2 about the fixed point O will be symmetrical with respect to the axis, and the resultant moment will be in the direction of the axis. If then we apply to the axis a force F (Fig. 25),

FIG. 26.

it will have a moment M (Fig. 27), perpendicular to the plane of F and the fixed point,

FIG. 27.

and according to equations (65) this will be the direction in which the vector H will move toward H' . The end of the axis will therefore move at right angles to the direction in which it is pulled. This is the basis of the explanation of the curious phenomena of all tops and gyroscopes. In the ordinary top, the weight acting downwards at the center of mass produces a horizontal moment; the point of the top accordingly begins to move horizontally, causing a movement of *precession*. When the precession begins, the rotation is no longer about the axis of symmetry, and the vector H no longer coincides with the geometrical axis of the top, but the end of the vector H always travels in a horizontal plane, and the axis of the top moves about it in a motion of so-called *nutation*. The rotary motions of the planets are explained in a similar manner.

MECHANICS OF EVOLUTION — MECHANICSVILLE

Mechanics of Development or Evolution. A term applied by German embryologists and biologists to the changes coincident with the reproduction, fertilization and later growth of organisms. In the organic world, living bodies are constantly undergoing changes of state, these changes being most conspicuous during the period of embryonic development. The changes in the conditions of life together with heredity and selection have caused the evolution of the world of plants and animals. These changes have been complex, and yet in every way have been made with exactness, order, and regularity, and the larger knowledge of developmental mechanics has in a great measure been due to the researches of Pander, Lotze, Born, Wilson, Loew, Ryder, Wyman, Driesch, and others. Probably the most noteworthy treatments, though of opposing schools, are those of Von Wilhelm Roux ('Programm und Forschungsmethoden der Entwicklungsmechanik der Organismen leichtverständlich dargestellt') (Leipzig, 1897); and of Dr. Oscar Hertwig ('Zeit- und Streitfragen der Biologie: Mechanik und Biologie') (Jena, 1897). Nature does for man in the organic what he has to effect in the inorganic world, and it is only necessary that he observe these changes to be able to state a series of relations of antecedent and consequent. See LIFE; GROWTH; KINETOGENESIS.

Mechanics' Lien, in statute law, a lien or claim upon real estate to secure payment for work or labor performed on, or materials furnished for buildings or other improvements thereon; which labor or material has been furnished at the request or with the consent, express or implied, of the owner of such real estate or other property. In early English law lands were charged with liens by express agreement of the owner, and were generally covered by mortgages. Courts of equity also recognized mortgage agreements. By statute other liens were created, including judgment liens and liens for taxes and assessments. In the United States the increasing number of independent contractors who constructed buildings on contract, and of dealers in building material, resulted in the enactment of numerous mechanic lien laws. Such laws have also been enacted in Canada, but not in Great Britain. The statutes hold that the value of real estate is increased by the addition of improvements and that the property should accordingly be held subject to such claims. Mechanics' liens are valid prior liens over all other claims, such as mortgages, judgments or taxes, and the term covers all claims for labor, whether skilled or unskilled, and for all building materials furnished. But liens are held against the property and not personally against the owner. The lien only attaches to the very property upon which the work was done, and has no effect on other pieces of real estate of the owner. In most States the law provides that the work to which the owner is entitled under a contract must be entirely performed before the contractor can file a lien. The statutes of mechanics' liens vary in the different States in the matter of details, time of filing, method of procedure, etc., and State statutes should be consulted. See LIEN; MORTGAGE.

Mechanicsburg, mē-kā'n'iks-bērg, Pa., borough, in Cumberland County, on the Cumberland Valley railroad; about 10 miles west by

south of Harrisburg. It was settled in 1806, and in 1828 was incorporated as a borough. It is situated in an agricultural region, in which there are large deposits of iron ore. The chief manufactures are foundry and machine-shop products, spokes and wheels, wagons and carriages. The borough is a distributing centre for the surrounding iron region, and a shipping point for a large quantity of iron ore. The Irving College (Lutheran) is located here. Pop. (1900) 3,841.

Mechanicsville, mē-kan'iks-vīl, N. Y., village, in Saratoga County; on the Hudson River and the Champlain Canal, and on the Delaware & H., and Boston & M. R.R.'s; about 20 miles north of Albany. The water-power is extensive. Power is transmitted from Mechanicsville to manufacturing establishments in Schenectady. Some of the manufacturing establishments of Mechanicsville are knitting mills, sash and blind factories, paper and pulp mills, and machine shops. The village owns and operates the waterworks. Pop. (1890) 2,679; (1900) 4,695.

Mechanicsville, Battle of (also called Battle of Beaver Dam Creek). After the battle of Oak Grove (q.v.) 25 June 1862, the Army of the Potomac was thrown upon the defensive by the sudden appearance of "Stonewall" Jackson on its right. North of the Chickahominy McClellan had but one corps in position, that of Fitz-John Porter, temporarily strengthened by McCall's division of Pennsylvania Reserves. McCall held the extreme right of the line at Mechanicsville and Beaver Dam Creek, with three brigades and five batteries of 26 guns. His main position was along the east bank of the creek, a tributary of the Chickahominy, and was very strong, his left resting on the Chickahominy, his right and advance extending to a body of woods near and overlooking Mechanicsville, held by a regiment and a battery. Rifle-pits had been constructed for the infantry, epaulments had been thrown up to cover the guns, and a strong picket-line was in front from Mechanicsville Bridge to Meadow Bridge along the Chickahominy. A. P. Hill's Confederate division and Cobb's Legion were in plain view from the left, intrenched on the opposite side of the Chickahominy. About noon of the 26th Hill's men were seen in motion. At 12:30 the Union pickets at Meadow Bridge were driven in, and McCall formed line; Reynolds' brigade on the right, covering the crossing of the road from Mechanicsville to Bethesda Church; Seymour on the left, covering at Ellerson's Mill the crossing of the road from Mechanicsville to Gaines' Mill; and Meade's brigade, with two batteries in reserve. A. P. Hill had 14,000 men in his division, which he had concentrated near Meadow Bridge, under orders from Gen. Lee to co-operate with Jackson, who was marching from Ashland to turn McClellan's right. Hill sent Branch's brigade and a battery to cross the Chickahominy seven miles above Meadow Bridge and communicate with Jackson's advance, and when Jackson had crossed the Virginia Central Railroad, Branch was to cross the Chickahominy, push down the river and uncover Meadow Bridge, which Hill was to cross at once and then sweep down to Mechanicsville, uncovering in turn the Mechanicsville Bridge, which Longstreet's and D. H. Hill's divisions

were to cross, when all were to push down the left bank of the Chickahominy and cut off McClellan's communications with his base at White House on the Pamunkey, and thus force him to abandon his operations against Richmond and retreat down the Peninsula. Jackson was behind his appointed time, and it was 10 o'clock before Branch opened communication with him. Hill grew impatient as the hours went by and nothing was heard from Branch or Jackson, and at 3 P.M. put his five brigades and six batteries in motion. Field's brigade seized Meadow Bridge and crossed, closely followed by the brigades of J. R. Anderson and Archer. The brigades of Gregg and Pender then crossed and marched across the country to support the right of the attacking column. Field's advance was met by a severe artillery fire; but, forming line, with Pegram's battery in the centre, it forced the Union advance of a regiment and battery from Mechanicsville back to the main line beyond Beaver Dam Creek. It had not been Gen. Lee's intention to attack McCall in position, but to have Jackson turn it. Jackson was not up in time; McClellan would doubtless penetrate his design and make a counter attack against Richmond; time was everything; the day was declining, and Lee ordered A. P. Hill to attack. The brigades of Field, Archer, and Anderson were ordered to advance on the Mechanicsville road against Reynolds. They were met by a withering fire of artillery and musketry, and were bloodily repulsed, though one of Anderson's regiments on the left succeeded in making a temporary lodgment beyond the creek. Parts of Porter's corps now came up and strengthened Reynolds' right. Following the repulse on the left, Pender's brigade and Ripley's of D. H. Hill's division made a most determined attack upon Seymour at Ellerson's Mill, but a mill-race, swampy ground, and other obstacles were in their way, and Seymour's direct and Reynolds' flank fire checked and then repulsed them with great loss. The attack was renewed, and a still more bloody repulse was the result, some of the regiments losing all their field officers and half their men. It was now sunset, and no further effort was made to assault the position, but the firing was kept up until 9 P.M. On the next morning McCall was ordered to fall back to Gaines' Mill (q.v.). The Union loss was 49 killed, 207 wounded, and 105 missing. The Confederate loss, killed and wounded, was over 1,500; Longstreet says between 3,000 and 4,000 killed, wounded, and missing, which is probably excessive. Longstreet further says: "Next to Malvern Hill, the [Confederate] sacrifice at Beaver Dam was unequalled in demoralization during the entire summer." Consult 'Official Records,' Vol. XI.; 'McClellan's Own Story'; Webb, 'The Peninsula'; Allan, 'History of the Army of Northern Virginia'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. II.

E. A. CARMAN.

Mechanism, or the **Mechanical Theory**, in its most general significance, means the relation of a limited number of invariable substances to each other in such a way that they vary in their relations according to invariable laws. More specifically it means the explanation of phenomena by the universal laws of matter in motion. It is closely connected with the at-

tempt to resolve bodies into their simplest elements and to explain their qualities as due to uniform laws of connection and interaction among these elements. The mechanical theory has usually been held in connection with some form of atomism (q.v.). Since the aim of this kind of explanation is to reduce qualitative determinations to quantitative and mechanical relations of elements, these elements have usually been conceived to possess only such qualities as were necessary to explain the empirical qualities, the ideal being to find a single homogeneous element possessing only the characteristics essential to corporeity. The term *mechanical* is also used in a looser sense, though still within the limits of the general definition given above, to describe any explanation which regards all the qualities of a body as due to the mere summation of the qualities of its parts; e.g., a mechanical theory of society.

Mechanism as a Theory of the World.—As a philosophical theory, mechanism is the attempt to regard the entire universe as a closed system of causes and effects in which every change is ultimately reducible to a change of motion. In this sense, therefore, it is practically synonymous with materialism (q.v.). It involves the entire elimination of teleology or final causes as a principle of explanation and the denial of any intelligent agency in natural phenomena. To be consistent it must attempt to explain all vital and psychic phenomena as due solely to mechanical forces. Such a theory of the universe appeared very early in the history of thought: It was first consistently developed in Greek philosophy by Democritus (c. 460-c. 357 B.C.) (q.v.), who taught that the only realities are atoms and empty space. Bodies vary only in the size, number, figure, and arrangement of the atoms which compose them. The atoms are qualitatively alike and act on each other only by pressure or collision. Every event takes place through a necessary cause. The atomistic philosophy was continued by the Epicureans, though for ethical and not for practical reasons. With the ascendancy of Aristotle during the Middle Ages, the mechanical view of the world fell into abeyance, but as a consequence of the renaissance of physical science, it was revived in modern times, first by Gassendi (1592-1655) (q.v.), and somewhat later by Hobbes (1588-1679) (q.v.). The latter constructed a complete and consistent theory of materialism in which he subjected to mechanical explanation not only external nature but also the phenomena of the human mind. The whole empirical universe is, for Hobbes, a manifestation of motion, which is the underlying reality. Consistent theories of materialism were held in France by La Mettrie (1709-1751), Baron d'Holbach (1723-1789), and Cabanis (1757-1808). The philosophical refutation of materialism was given by Kant (1724-1804) (q.v.) when he proved that in all experience the nature of the knowing mind itself is a determining factor and that it is therefore vain to seek in experience for knowledge of a reality which by hypothesis is unrelated to mind.

Mechanism as a Method of Explanation.—After the Middle Ages the development of the new science, at the hands of Copernicus, Kepler, and Galileo (qq.v.), and many of their con-

MECHANISM

temporaries, depended very largely on the application to nature of the method of mechanical explanation. Francis Bacon (1561-1626) (q.v.), by his opposition to the use of teleology in scientific explanation, did much to bring about the acceptance of mechanism, and it was firmly established as the true scientific method of dealing with nature by Descartes (1596-1650) (q.v.), who, though not an atomist, still denied to matter all but quantitative characteristics and defined the method of science as strictly mechanical. Even the physical phenomena of living bodies (everything in the world, in fact, except the *res cogitans* in man) he regarded as capable of a purely mechanical explanation. From this time on mechanism became the recognized method for natural science, and consequently it soon became an urgent philosophical problem to discover a satisfactory way of reconciling the mechanical conception of nature with a teleological and idealistic conception of the universe. Thus Leibniz (1646-1716) (q.v.), while admitting the necessity of reducing all natural phenomena to motion, held that ultimate reality consists of an infinity of centers of force (monads), which he conceives as in some sense analogous to minds. Accordingly, metaphysical explanation must be in terms of teleology, though mechanism is the sole valid explanation of the phenomenal manifestation of reality in nature. A similar conception, having its historical origin in Leibniz, was held in the 19th century by Lotze (1817-1881) (q.v.), who proclaims the purpose of his philosophy to be "to show how absolutely universal is the range of mechanism, and at the same time how completely subordinate the significance of the function which it has to fulfil in the structure of the world" ('Microcosmus,' Introduction). Kant also regards the mechanical categories as the sole valid means of scientific explanation. The causal category is, for him, rigorously constitutive of our experience and hence is determinant of our conception of all objects in the world of experience; teleology, on the other hand, though a necessary means of regulating our investigations of organized matter, remains a merely subjective principle which can give no insight into the origin of any being. When we deal with objects which "cannot be thought by us, as regards their possibility, according to the principle of mechanism," we may treat them "as if" they were teleologically ordered; but "nothing is gained for the theory of nature or the mechanical explanation of its phenomena by means of its effective causes, by considering them as connected according to the relation of purposes." The phenomena of the moral life, according to Kant, lie outside the realm of scientific experience and hence are not subject to mechanical explanation. Since Kant's time, many thinkers, perhaps the majority, have followed him in regarding mechanism as the ultimate principle of explanation for science; thus Helmholtz, F. A. Lange, Dubois-Reymond, Clausius, Thomson, Maxwell, etc. Wundt attempts to find for it a logical justification as the only theory which can afford an adequate conception of natural causality. On the other hand, more recent writers, especially among physicists, have taken the opposite view. According to them, the preëminence of mechanical explanation is merely a dogma based on its successful use in

science. E. Mach, Stallo, Helm, and H. Cornelius take this position. These thinkers maintain that the purpose of scientific explanation is to condense into a single compact statement (e.g., a mathematical formula) a large mass of empirical data. A scientific law is merely a shorthand statement of the facts, and its value is purely economic. So long as the mechanical theory affords useful analogues for the formulation of other phenomena, it is a valid scientific method. Whenever this ceases to be the case, mechanism must be superseded by a more economical theory. Kant's conception of mechanism as a mode of dealing with experience, has been developed by contemporary English idealism. The general problem of all rational knowledge is conceived to be the construction and maintenance of a coherent and systematic experience. In all thought, therefore, there is implied a totality which constitutes the truth. But this totality manifests itself in different categories of thought and in varying degrees of perfection. "Matter and motion are the abstractions in which the sensuous world is reduced to homogeneity in order to be susceptible of quantitative treatment, and in this treatment they are able to a large extent to represent genuine and actual relations of that world" (Bosanquet, 'Logic,' Vol. I, p. 200). Mechanical explanation, therefore, is one form in which the unity of thought may be manifested; it is "that form of identity and difference in which an identity is regarded as the sum of the differences in which it is presented" (*Ibid.*, p. 201). Its value for knowledge is therefore said to be instrumental or methodological, because it is a method which thought uses in its effort to construct a rational experience. It possesses ultimate truth just in proportion to the degree of rational unity which it achieves in experience as a whole.

In biology the term mechanism is used, in contrast with vitalism, to indicate a theory which attempts to explain all vital phenomena by chemico-physical processes, strictly from the point of view of cause and effect, without appealing to a teleological principle of explanation. The term "Developmental Mechanics" has been proposed by Roux as a name for that department of biology which investigates experimentally the development of the individual organism, conceived as standing in more or less mechanical relations with the environment. Consult Roux's 'Problems, Methods, and Scope of Developmental Mechanics' (Lectures Delivered at the Marine Biological Laboratory of Wood's Hole in the Summer Session of 1894, pp. 149 ff.).

In psychology the term mechanism is sometimes used to describe a theory which seeks to explain mental phenomena as due to the combination or interaction of simple psychic elements. This usage is an analogy with the atomic theory of matter. The classical example is Herbart (q.v.), who gave the term currency. According to his theory, every representation has a constant quality and a variable force. These forces stand in relations of greater or less opposition and the whole state of consciousness is conceived as a resultant of all the forces involved in it. Consult Th. Ribot's 'German Psychology of To-day' (Eng. trans. by J. M. Baldwin, pp. 24 ff.).

MECHITARISTS—MECKLENBURG COUNTY

GEORGE H. SABINE,
Leland Stanford University.

Mechitarists, mēk'-tār'ists, a sect of Armenian Christians acknowledging the authority of the pope, but retaining their own ritual. The name originated from Mechitar Da Petro, who in 1701 founded a religious society at Constantinople for disseminating a knowledge of Armenian literature. They soon removed to the Morea, whence in 1715 they went to Venice, and later to the island of San Lazzaro.

Mechlin, mēk'lin (Dutch, mēn'lin), or **Malines**, mā-lēn, Belgium, a city on the Dyle, 14 miles southeast of Antwerp. The ancient walls and moat have been replaced by a wide boulevard and canal, the streets are wide and regular, and it has fine squares and public buildings. It is the see of the Primate of Belgium and has numerous churches. St. Rombold's Cathedral, a vast building covering nearly two acres, was built in 1437-52; the clock-tower, however, 324 feet high, remains unfinished; the cathedral contains Van Dyck's 'Crucifixion.' The churches of St. John and Our Lady contain works by Rubens; the town hall dates from the 15th century; the Cloth Hall, now used as a guard-house, from 1340, while also noteworthy are the modern archiepiscopal palace, the Beguinage, and the Salm Inn (1534). The manufacture of pillow lace and of cloth, so famous in the 15th, 16th, and 17th centuries, has been largely transferred to Brussels; the chief industries now are carpentry, cabinet making, brewing, horticulture, and agriculture; extensive railway works have been established here. Pop. (1901) 56,013.

Mecklenburg, mēk'lēn-boorg, Germany, a territory on the Baltic Sea, a former Saxon province, now divided into the grand-duchies of MECKLENBURG-SCHWERIN and MECKLENBURG-STRELITZ.

(1) Mecklenburg-Schwerin, bounded on the north by the Baltic Sea, elsewhere chiefly by Prussia and Mecklenburg-Strelitz, has an area of 5,135 square miles. The capital is Schwerin. Pop. (1900) 607,835. Mecklenburg-Schwerin is watered by several rivers, most important of which are the Elbe and its tributaries, the New Elde and the Süde, on the southern border, the Warnow, the Recknitz and the Stepenitz, which flow toward the Baltic. There are many lakes and ponds, the largest of which are the Müritz See (51 square miles), the Schweriner See (23 square miles), the Kölpiner, and the Plauer See. The country is generally flat, though here and there intersected by low ranges of hills, and its surface is extensively covered with wood. Near the sea are large tracts of sand and morass. The climate, though raw, is mild and healthful; the average temperature throughout the year is 46° and the precipitation is 21 inches.

The principal industries are agriculture,

dairying, and stock-raising. The chief crops are wheat, rye, oats, barley, corn, pease, beans, beets, turnips, and potatoes, and tobacco is cultivated to some extent. The principal manufacturing industries are foundries, machine shops, brick yards, tanneries, paper mills, sugar refineries, breweries, distilleries, tobacco factories, etc. There is considerable commerce through Warnemünde (Rostock) and Wismar.

The predominant form of religion is the Lutheran. Besides the University at Rostock there are several gymnasia, and numerous, burgher, parochial, and other schools. The two Mecklenburg duchies have a common assembly or Landesunion, consisting of the representatives of the landed aristocracy or Ritterschaft and the burgomasters of 49 towns; the tenants of the royal domains have no representation. The assembly meets once a year, alternately at Malchin and Sternberg. The executive authority in Mecklenburg-Schwerin is vested in a cabinet of four ministers; there are also a permanent committee consisting of nine members at Rostock, who represent the two estates when the assembly is not in session, and deputation and convocation diets, which may be assembled upon special occasions and for special purposes. Mecklenburg-Schwerin has two votes in the federal council, and six representatives in the Reichstag. Each duchy has a separate system of lower courts but they have a supreme court at Rostock in common. There is no general financial budget for Mecklenburg-Schwerin; there are three entirely distinct systems of finance. The budget of the first system is called the administration of the sovereign; the second, the states administration, and the third the ordinary budget of the common administration.

(2) Mecklenburg-Strelitz, divided by Mecklenburg-Schwerin into two large districts, the circle or lordship of Stargard, and the principality of Ratzeburg, both on the east, and on the west in several smaller districts, existing in separate patches, has an area of 1,131 square miles. Pop. (1900) 102,628; capital Neustrelitz. The country is flat and similar in physical characteristics to Schwerin. Strelitz has one joint representative chamber with Schwerin, but Ratzeburg is not included in these estates, and is governed directly by the grand duke. The grand duke gave Ratzeburg a representative constitution 1869. Mecklenburg-Strelitz has one vote in the federal council of the empire, and one representative in the diet.

Mecklenburg (mēk'lēn-bērg) **County**, N. C. The story of Mecklenburg County in North Carolina involves a story of three races of people, namely, the Indian, the white man, and the negro. Without ever having a definite purpose to do so the white man drove out the Indian. Having always a definite purpose to Christianize and civilize the Indian, the white race, contrary to its purpose, exterminated the red race. This was accomplished in effect in the first half of the 18th century. The early white settlers were mainly Scotch, Irish, German, and English. The first vocations of the white settlers were in the main agriculture, but from the first settlements such arts as smithing, wheel-wrighting, spinning, and weaving were practised. These and other primitive manufactures were rapidly developed and enlarged. In the second half of the 18th

MECKLENBURG DECLARATION — MEDAL

century the Piedmont region of the South became more flourishing in manufactures than any other part of the Union. Blast furnaces, rolling mills, machine shops, woolen factories, cotton factories, hat factories, wagon and carriage factories, gun shops and many other manufacturing interests grew in numbers and importance. The colonists built to great prosperity. They felt hampered by restrictions of the king and parliament in England. They resisted these restrictions. Increasing discontent made increased resistance. On 20 May 1775 a convention of Mecklenburg County met in Charlotte and made a declaration of Independence of the King. On 31 May following a series of resolutions were passed defining a method of government of the county by its own people.

In 1793 Whitney of New Haven, Conn., invented the cotton gin. In 1795 Holmes of Hamburg, S. C., improved the Whitney gin by introducing saws in place of wire spikes, making it practical. In 1800 the gin had become generally introduced into Mecklenburg County. From this time forward manufactures diminished in importance, while agriculture in the form of cotton production increased in importance. Here the third race, the negro, became a factor of growing importance. Slaves were brought from Northern States to put in the cotton fields and also imported from Africa. Agriculture with slave labor became of more and more importance, while manufactures and commerce became of less and less importance. By 1830 the county had become wholly one of agriculture, and slavery had become dominant. The former skilled white labor emigrated largely to what was then the Northwest Territory. Another tide of emigration turned to the Southwest, where land could be found to further employ slave labor in the production of cotton, rice and sugar. Immigration of white people stopped. The white labor left were relegated to farms more or less exhausted by unscientific agriculture and these became what some people called the "poor whites" of the South.

Civilization demanded the abolition of slavery. Slaveholders opposed this and controlled a following which postponed the event and tended to isolate the territory in which slavery was the controlling influence. Constant pressure of the subject brought Secession, the War, abolition. The Civil War was destructive. The fall of slavery was more destructive. The investment of freedmen with franchise and other privileges to which they were wholly unaccustomed and for which the race was, at least at that time, unfit, brought a period of semi-anarchy. On the re-establishment of good government manufactures which had languished throughout the period of slavery were re-established. Commerce revived. A system of public education was established. Emigration ceased. Immigration set in again. Before the time of slavery the county made great progress. During the time of slavery the county stood still. After the time of slavery the county again makes great progress.

Some of the principal events of the county have been the following:

First White Settlements, 1720.
Creation of Mecklenburg County, 1762.
Declaration of Independence, 20 May 1775.
Beginning of Charlotte, 1765.
Andrew Jackson born, 15 March 1767.
James Knox Polk born, 2 Nov. 1795.

United States Mint, branch mint established 1837.
Macadam Road Building begun 1884.
First Cotton Mill, 1881.
First Cottonseed-oil Mill, 1882.

D. A. TOMPKINS.

Mecklenburg (mĕk'lĕn-bĕrg) **Declaration**, in American history, a series of rebellious resolutions adopted 20 May 1775, at Charlotte, Mecklenburg County, N. C., by a convention held at midnight, and representing each militia company in the county. The resolutions declared that the people of Mecklenburg County were free and independent of the British crown, and not only was the general tenor that of the Declaration of Independence, but many phrases in the resolutions are word for word as they appear in that document. The minutes of the midnight meeting are said to have been destroyed by fire in 1800. Whether the Declaration of Independence followed the words of the Mecklenburg Declaration, or whether the latter, having probably been replaced from memory, was tinged with the former, is a disputed question. Consult Cooke, 'Revolutionary History of North Carolina' (1853); Draper, 'The Mecklenburg Declaration' (1874).

Meconic Acid, an organic acid occurring in opium, and having the formula $C_9H_9O_4(OH)(COOH)_2$. In preparing it, the opium is exhausted with water at 100° F., the infusion is neutralized with calcium carbonate and evaporated to a syrup, and calcium meconate is precipitated by adding a concentrated solution of calcium chloride. Two crystallizations from hot dilute hydrochloric acid follow, and the free acid is then deposited in the form of small scales, containing three molecules of water. Upon heating to 212° F. the hydrated crystals lose their water, and become white. Meconic acid is readily soluble in alcohol, but only slightly so in ether and in cold water. It has a sour taste and a pronounced acid reaction, and its solutions are turned red by ferric chloride, $FeCl_3$. Meconic acid forms numerous salts ("meconates"), as well as various organic derivatives; but none of these is of importance in the arts.

Medal, a piece of metal in the form of a coin, stamped with a figure or device to preserve the portrait of some eminent person, or the memory of some illustrious action or event. Medals belong to two periods, ancient and modern, separated by a wide interval. Early Greek and Roman medals were struck for prizes in athletic games, or in commemoration of great events. The Roman series of medals or medallions is very extensive in gold, silver and brass or copper. The gold medals begin with Constantine and continue to the fall of the empire; the silver begin under Gallienus and continue as long; the copper from Augustus to Alexander Severus.

In more modern times the art of medal-making has been brought to great perfection, and most of the principal nations have adopted the plan of preserving their history by these durable monuments. The French series is deserving of special mention as the most perfect and complete in the world. It commences under Louis XI., and continues to the present date, illustrating every important event in the history of France. The English series commences under Henry VIII., but as works of art the medals have not high rank. The British battle medals,

MEDAL OF HONOR—MEDANO

however, form an admirable series. The Italian and German medals of modern date are very fine. The mediæval are interesting and bold in design, but rude in execution. The papal series, commencing with Paul V., are worthy of attention.

One of the earliest American medals is that presented to General John Armstrong for his successful attack in 1756 on the Indians at Kittingan. Most of those struck during the Revolution were made in France. The next American medal of which there appears to be any record is that which was presented to General Gates after the surrender of Burgoyne, 17 Oct. 1777. On 25 March 1776, when news of the British evacuation of Boston reached Congress, that body resolved that its thanks be presented to the Commander-in-Chief, and that a gold medal be struck in commemoration of the event. This medal was nearly two and three quarter inches in diameter. On one side was a profile head of Washington, with the legend in Latin: "The American Congress to George Washington, the Commander-in-Chief of its armies, the assertor of freedom." On the reverse the device showed troops advancing toward a town, others marching toward the water, ships in view, General Washington in front, mounted, with his staff, whose attention he is directing to the embarking enemy. The legend is: "The enemy for the first time put to flight." Then, too, at the time of his death, among minor honors paid to the great general's memory, was the publishing of a silver commemorative medal.

There is the record of one medal only granted by Congress in commemoration of any naval victory during the War of the Revolution, and that was a gold one presented to Paul Jones for his defeat of the British frigate *Serapis* when commanding the *Bonhomme Richard*, 23 Sept. 1779. Other gold medals were those presented to Commodore Perry and Lieutenant Jesse D. Elliot for the part which they took in the battle of Lake Erie, 8 Oct. 1812; to Captain Lawrence, who, in command of the *Hornet*, 24 Feb. 1813, captured the British brig *Peacock*; to Captain Warrington of the *Peacock*—then under the Stars and Stripes—for the capture of the *Epervier*, 20 April 1814; to Captain Thomas Macdonough, who commanded the American squadron in Plattsburg Bay, August 1814; to Captain Decatur, who, in command of the United States, captured the British frigate *Macedonian*, 25 Oct. 1812; and to Captain Jones and Captain Blakely, who, when commanding the *Wasp*—the one, 12 Oct. 1812, and the other 28 June 1814—captured respectively the *Frolic* and the *Reindeer* from the British navy.

The giving of medals went out of fashion after the second war with Great Britain, and but little was done by the government during the War of the Rebellion. Major Robert Anderson received two medals for his gallant defense of Fort Sumter, but one was presented by the citizens of New York and the second by the Chamber of Commerce of the same city. After the successful operations by Grant in East Tennessee and at Chattanooga, Congress voted him thanks and a gold medal with suitable emblems, devices and inscriptions. It is worthy of remark that no less than 189 medals were struck in honor of Abraham Lincoln, and later medals have been issued in memory of Garfield and McKinley, and in honor of Sampson, Schley,

Dewey, and others in the Spanish-American War. See also COINAGE; NUMISMATICS; TOKENS.

WILL M. CLEMENS.

Medal of Honor, United States Military, an honor bestowed upon army and navy officers and men for specific services; regarded as a higher token of the war hero than the Victoria Cross of England, the medal of the Legion of Honor of France, or the Iron Cross of Germany. It is given not for the sheer performance of duty, no matter how hazardous that duty may be, but for some voluntary act of valor, beyond the bounds of mere obedience to orders. Out of the 5,000,000 men who have battled for the United States in the different wars this country has had, the vast majority, as history shows, performed their duty. Out of these 5,000,000, however, have been 2,000 men who have done more, who have braved dangers when they were not expected to brave them, overcome difficulties that were regarded by the rest as insurmountable, and faced death when it seemed it meant the sacrifice of their own lives. Many are the ways these medals have been won. By the Act of 12 July 1862 the United States government authorized the striking of 2,000 medals to be given to non-commissioned officers and privates for gallantry in action and soldier-like qualities. On 3 March 1863 the sum of \$20,000 was appropriated for making the medals, and officers were made eligible to receive them. Medals were also authorized by Congress in recognition of acts of bravery performed (during the war with Spain in 1898) in the naval battles of Manila and Santiago, the Manila medals bearing the portrait of Admiral Dewey, and the Santiago medals a portrait of Rear-Admiral Sampson. The medal is a bronze five-pointed star within a circle of stars, suspended by a trophy of two crossed cannons surmounted by an eagle, united by a ribbon of 13 stripes of red, white and blue.

Medal of Honor Legion, an association of officers and enlisted men of the Union army, who during the Civil War were awarded medals of honor for special acts of bravery and devotion. The association has 1,000 members among the army veterans and 200 among naval veterans. The meetings are held annually.

Medallion, mē-dāl'yōn. (1) The term medallion in numismatics is applied to those productions of the mint of ancient Rome, or struck in the provinces under the empire, which, if gold, exceed the *aureus* in size; if silver, the *denarius*; and if copper, the first or large brass. Medallions are not numerous. Those struck in the Greek provinces are more common than the Roman, but of inferior workmanship. A beautiful and famous gold medallion exists of Augustus, and one of Domitian, but few, in any metal, are found prior to the reigns of Hadrian and Antonine; those in brass are the largest, many of them being several inches in diameter, and for the most part of admirable workmanship. (See MEDALS.)

(2) In architecture, an oval panel carved in bas-relief. The same term is used for a color design.

Medano, mā-dā'nō, the Spanish name for peculiar moving sand-hills in Peru. They are seen on the plain of Ilay near Arequipa, and are crescent-shaped bodies of white sand, which move across the desert in the direction of the

winds which blow from sunrise to sunset. The sand composing the medano seems different from the desert sands over which the moving mass is blown or carried.

Medary, Samuel, American editor and politician: b. Montgomery Square, Montgomery County, Pa., 25 Feb. 1801; d. Columbus, Ohio, 7 Nov. 1864. In 1825 he settled at Batavia, Clermont County, Ohio, and in 1828 established the 'Ohio Sun' in support of Jackson's candidacy for the presidency. He sat for Clermont County in the State house of representatives in 1834-5, and was a member of the State senate in 1835-7. In 1837 he purchased at Columbus the 'Western Hemisphere,' later the 'Ohio Statesman,' which he edited until 1857. In 1857-8 he was governor of Minnesota territory, and in 1858-9 of Kansas territory. He established the 'Crisis' at Columbus in 1860, and was its editor until his death. He gave active aid to Morse in the promotion of the electric telegraph, was a firm supporter of the measures of Jackson and Douglas; is said to have originated the battle-cry 'Fifty-four forty, or fight!' in connection with the Oregon boundary dispute; and was often called the 'old wheel-horse of Democracy.'

Medea, *me-dē'a*, a powerful sorceress of the Greek heroic age, daughter of Æetes, king of Colchis. By some her mother is said to have been Idyia, daughter of Oceanus; by others Hecate or Neera. By her profound knowledge of the magical virtues of plants she practised witchcraft. She became the wife of Jason (q.v.), the leader of the Argonauts. For 10 years she lived with him after having supported him in every danger, till the charms of Glauce, or Creusa, the daughter of King Creon, kindled a new passion in him, and he discarded Medea, who brooded on revenge. With this purpose she sent the bride, as a wedding gift, a poisoned garment, also a poisoned crown of gold, which Glauce put on and died in agony. The sorceress reduced Creon's palace to ashes by a shower of fire, murdered her two children by Jason, and then mounted her dragon chariot and escaped. Some say that she went to Hercules, others to Athens, to King Ægeus, by whom she had Medus. From Athens also she was banished as a sorceress. She finally returned to her home, where her son Medus reinstated her father, who had been dethroned by his brother Perses, after which she died. The story of Medea has often been a subject of tragic poetry ancient and modern. The tragedies of this name, by Æschylus and Ennius, have perished, as well as the Colchides of Sophocles. The Medæas of Euripides and Seneca are alone extant. The story has also been dramatized by Corneille and Grillparzer. Cherubini made this myth the subject of an opera.

Medellin, *mā-dēl-yēn'*, Colombia, Central America, a city, the capital of the department of Antioquia, and an episcopal see, picturesquely situated in a mountain valley 4,850 feet above sea-level on the Porce, an affluent of the Canca, 150 miles northwest of Bogota. It was founded in 1674, and has a cathedral, college, seminary, technical school, mint, hospital, and other public buildings. The development of the gold and silver mines in the region has contributed largely to its modern progress. It has manufactures of pottery, porcelain ware and jewelry, and has a

considerable trade, exporting gold, silver, coffee, and hides. Pop. (1900) 40,000.

Medford, *mēd'fōrd*, Mass., city, in Middlesex County; on the Mystic River, and on the Boston & Maine railroad; five miles northwest of Boston. The area is about 10 square miles. It was founded in 1630 by people from Salem who called the place Meadford. In 1802 it was chartered as a city having within its limits the villages of South Medford, West Medford, Hillside, Glenwood, and Wellington. It is a residential suburb of Boston, but it has some important industrial interests, chief of which are the manufacturing of machinery, cotton goods, dyes, rum, chemicals, carriages, brick, and novelties. It is the seat of Tufts College (q.v.), and has the city and the college libraries. The Cradock House, built in 1634, is one of the oldest, if not the oldest building in the United States which retains its original form. The city has four large and several small parks. Oak Grove, the largest of its three cemeteries, has an area of 34 acres.

The charter granted in 1892 is still in force and provides for the administration of the municipality by a mayor, who holds office two years, and a board of aldermen composed of 21 members. The administrative officials are appointed by the mayor or elected by the council. The board of education is chosen by popular vote. Pop. (1890) 11,079; (1900) 18,244; (1905) about 22,000. Consult: Usher, 'History of the Town of Medford, Mass.'

Medford, Wis., city, county-seat of Taylor County, on the Black River, and on the Wisconsin Central railroad; about 60 miles northeast of Eau Claire. It is in an agricultural and lumbering region. The chief manufactures are cheese, foundry products, lumber, and leather. It has considerable trade in lumber, leather, and cheese. Pop. (1900) 1,758.

Medhurst, *mēd'hērst*, **Walter Henry**, English oriental scholar and missionary: b. London 1796; d. there 24 Jan. 1857. He was educated for the ministry, and in 1816 made a missionary tour through India and Malacca, establishing himself in 1822 in the island of Java, where he remained eight years. During this interval and for several years afterward he pursued his missionary labors also in Borneo and on the coasts of China. In 1843 he settled in Shanghai and subsequently passed six years in the interior of China. He was an intelligent student of the languages and literatures of eastern Asia, being well versed in the Chinese, Japanese, Javanese, and other dialects, beside Dutch, French, and English, in all of which he wrote. Beside a Chinese version of the Bible, he published 'Chinese Repository' (20 vols. 1838-51); 'Chinese and English Dictionary' (1842-3); 'English and Chinese Dictionary' (1847-8); 'English and Japanese Vocabulary' (1830); 'Dictionary of the Hokkien Dialect' (1832-9); 'Translation of a Comparative Vocabulary of the Languages of China, Corea, and Japan' (1835); 'Notes on Chinese Grammar' (1842); 'Chinese Dialogues' (1844); 'China in its State and Prospects' (1838); etc.

Media, *mē'di-a*, Asia, an ancient kingdom and country of considerable extent, now comprised in the provinces of northwest Persia. It was originally inhabited by a Turanian race, who are called Medes by ancient writers; but this

name properly belongs to an Aryan race, who had spread themselves widely in the high regions of Western Asia, and ultimately established their ascendancy in Media. They have been traced both by Persian and Indian traditions to the countries beyond the Indus. The history of Media is involved in considerable obscurity, but careful modern investigations have made the main outlines fairly clear. The Medes are first mentioned in connection with some of the kings of Assyria from the 9th century B.C. Rammān-nirari II. of Assyria, who reigned about 810 B.C., led expeditions into Media, and in 713 the great King Sargon conquered the country and made the Median princes tributary to the Assyrian monarchy. According to the Assyrian inscriptions, one of the Median rulers named Dajauku was carried off as a prisoner in 715 B.C.; this Dajauku is the same as the Deioces who, according to Herodotus, founded the Median kingdom on an independent basis and fixed his capital at Ecbatana (now Hamadan). Deioces was followed by three kings in succession, bearing the names (in Greek) of Phraortes, Cyaxares, and Astyages. Phraortes, to whom the Greek historian assigns a reign of 22 years (647-625 B.C.), began the extension of the Median empire by the subjugation of the mountainous region of Persis, to the southeast of Media. He then conquered other parts of Asia, and at length ventured to take the aggressive against the Assyrians and attack Nineveh. In this attempt he failed and lost his life. Cyaxares succeeded him on the Median throne, and during a reign of 40 years raised his kingdom to the greatest power and importance it was destined to achieve. He thoroughly reorganized the army and advanced against Nineveh. He gained several successes, but before he could take the Assyrian capital he had to return to defend his kingdom against the inroads of Scythians. At first the Scythians carried all before them and became virtually masters of Media, but Cyaxares temporarily secured his position by negotiating with them, and finally slew all their chiefs when they were overpowered by wine at a feast. Thus rid of Scythian authority, Cyaxares again advanced against the Assyrians. In conjunction with Nabopolassar, founder of the Neo-Babylonian empire, he captured Nineveh about the year 606 B.C. After this event the Assyrian dominions were partitioned between the two conquerors, the northern parts falling to Media and the southern portions to Nabopolassar. Nebuchadrezzar, son and successor of Nabopolassar, married a daughter of Cyaxares. Cyaxares carried his arms into Asia Minor and waged war for five years against Alyattes, king of Lydia. On 28 May 585, the Median and Lydian forces were engaged in battle when a total eclipse of the sun took place and struck terror into the soldiers on both sides. This event disposed both sides to enter into peace negotiations, which were successfully carried through by the agency of Nebuchadrezzar and Sennesis, prince of Cilicia. Cyaxares probably died very shortly after this event, and left to his successor a greatly extended empire. Astyages was the last independent king of Media, and from 550 B.C., when he was conquered by Cyrus the Persian, Media formed part of the Persian empire.

Media, Pa., borough, county-seat of Delaware County; on the Philadelphia, Wilmington

& Baltimore railroad; about 15 miles west of Philadelphia. It is a well-built, well-kept residential suburb of Philadelphia, and is situated in a fertile agricultural region. It is the headquarters for the Delaware County Institute of Science, established in 1833. The Institute has a library of about 5,500 volumes, and the borough library has about 3,500 volumes. The street-lighting plant and the waterworks are owned and operated by the borough. Pop. (1900) 3,075.

Me'diatiza'tion, a term applied especially to the process by which, on the dissolution of the German empire in 1806, the smaller princes who had depended immediately on the empire were subjected to the authority of the princes of the Confederation of the Rhine, and became *mediatized* or dependent members of that confederation, or otherwise became dependent upon more important German states.

Medical Association, American. See AMERICAN MEDICAL ASSOCIATION.

Medical Code, a set of regulations adopted by a medical association outlining the conduct of members of the profession. The various codes prohibit advertising in public prints, as well as the endorsement of proprietary or secret remedies. The ethics of both "regular" and homoeopathic schools define the relations of patient and physician and of attending and consulting physician, and provide that a physician shall attend the immediate family of a brother physician without charge, except when unusual labor, expense, or exposure is involved. The medical code in this country was founded on the English code of medical ethics prepared by Thomas Percival in 1803. In 1847 the American Medical Association adopted a general code which superseded codes existing in several States, and which was unopposed till 1882. In the latter year a majority of the members of the New York County Medical Society voted to disobey the provision of the code which forbade them to consult with any but "regular" physicians, claiming the right to consult with any physicians that the legislature of each State decided to be legally qualified. Similar action was taken by a majority of the members of the New York Academy of Medicine. This antagonism affected the whole profession in this country, and the immediate result was the formation of New York county and State associations, whose delegates were received by the American Medical Association to the exclusion of those from the old societies. In 1903 steps were taken to heal their differences and unite the rivals into one body, with the code so modified in effect as to allow individual liberty in the matter of consultation. Consult Flint, 'Medical Ethics and Etiquette' (1883).

Medical Colleges for Women. In the United States in 1903, over 1,200 women were students in the various medical colleges. In Philadelphia the Woman's Medical College of Pennsylvania, the only institution of the kind in this country, has met with marked success. In 1903, there had been to date a total graduation from this college of 244 students, and an effort was made to trace the careers of these graduates. Of this number 166 responded affirmatively to the question, Are you now engaged in active medical practice? Twenty-three responded in the negative, giving as rea-

MEDICAL DEPARTMENT — MEDICAL EDUCATION

sons for the negative reply: Domestic duties, 8; philanthropic work, 1; ill health, 6; retired, 3; no reason assigned, 5. Seventy-six of the women replied stating the monetary value of their practice a year. Twenty-four made \$1,000 a year or more, but less than \$2,000; 20 as much as \$2,000, and less than \$3,000; 10 as much as \$3,000 and less than \$4,000; 5 as much as \$4,000 and less than \$5,000; 3 as much as \$5,000 and less than \$15,000. Four reported sums varying from \$15,000 to \$20,000 a year. Ten reported less than \$1,000 a year. The average income was found to be \$2,907.30. See also EDUCATION, PROFESSIONAL, IN AMERICA.

Medical Department, U. S. Army. See ARMY OF THE UNITED STATES.

Medical Department, U. S. Navy. See NAVY OF THE UNITED STATES, THE.

Medical Education. Before the establishment of medical schools in this country medical students either went abroad to study or served an apprenticeship with some practising physician. The latter custom was common in view of the expense incident to work abroad, and continued till very recently. As a rule the apprentice had little opportunity for study, but was forced to depend on what he could absorb by contact with his preceptor. The physicians of the 17th and 18th centuries who had studied abroad were usually classical students and in their preliminary training set an example that it would have been wise to follow. The first public lectures on anatomy before a class of students in this country are said to have been delivered by Dr. William Hunter of Newport, R. I., in 1752. It seems, however, that Dr. Giles Firmin as early as 1647 delivered readings on human osteology in New England; that Dr. Thomas Cadwallader of Philadelphia gave instruction to students in anatomy between 1745 and 1751; and that Drs. John Bard and Peter Middleton dissected the human body in New York city in 1750 for purposes of medical instruction. In 1762 Dr. William Shippen of Philadelphia gave a course of lectures on anatomy, illustrated by actual dissections. These lectures were continued till the organization of the Medical College of Philadelphia (now the medical department of the University of Pennsylvania) in 1765. Dissections were rarely performed prior to 1760 and even autopsies were seldom permitted. At the time of the American Revolution, with a population of 3,000,000, there were probably about 3,500 physicians in the colonies, of whom it is estimated that not more than 400 had received medical degrees. In New England the clergyman was often the only available physician. Two medical schools were organized in the Colonies, the Medical College of Philadelphia (now a department of the University of Pennsylvania) in 1765, and the medical department of King's (now Columbia) College, in 1768. The first medical degree conferred in this country, that of bachelor of medicine, was granted to 10 men by the Medical College of Philadelphia in 1768. The degree of doctor of medicine was first conferred in 1770 by the medical school of King's College on two students who had taken the bachelor's degree in 1769. Fifty-one medical degrees had been conferred by these institutions before 1776, when operations were suspended by the war. In the colonial period two medical societies (the State Medical

Society of New Jersey, in 1766, and the Delaware State Medical Society, in 1776) and one permanent general hospital were organized. Harvard University Medical School was organized in 1782, Dartmouth Medical College in 1797, the School of Medicine of the University of Maryland and the College of Physicians and Surgeons of New York in 1807. In 1813 the medical department of Columbia College was finally discontinued; the College of Physicians and Surgeons took its place in 1860. Of the 148 medical schools now existing in the United States and registered by the University of the State of New York 3 were established between 1765 and 1800, 12 between 1801 and 1825, 19 between 1826 and 1850, 29 between 1851 and 1875, 80 between 1876 and 1900, 5 between 1901 and 1904.

At the time of the organization of the early medical schools the practice of obstetrics was relegated as a rule to ignorant midwives; physiology, histology, organic chemistry, pathology, and surgery, as now recognized, were hardly known. The schools at first conferred the degree of bachelor of medicine on those who had studied two years with a preceptor and attended one course of lectures, the degree of doctor of medicine after three years of study and two courses of lectures. The bachelor's degree was abandoned in 1813. At first the Medical College of Philadelphia required for admission some knowledge of Greek and Latin, physics, natural history, and botany, but the requirement was abandoned about the time of the reorganization of the University of Pennsylvania in 1792. For a century there were as a rule practically no requirements in preliminary general education for admission to medical schools, and even to-day this is their greatest defect.

In 1839 the New York State Medical Society resolved that teaching and licensing ought to be separated as far as possible. Further discussion of this question led to a convention of delegates from all medical schools and societies in the United States, held in New York in 1846; from it sprang the American Medical Association. This national organization, thoroughly representative in character, gave a new impetus to medical societies. The following societies have exercised an important influence in promoting higher standards: Association of American Medical Colleges (1890); American Institute of Homœopathy (1844); National Confederation of Eclectic Medical Colleges (1871); Southern Medical College Association (1892). These prescribe for admission to medical schools a preliminary general education equivalent to one year in a high school. All prescribe four courses of lectures in different years as a condition for an M.D. degree, though they give an allowance of one year to graduates of reputable literary colleges and of other professional schools. All tend to improve facilities for teaching, dissections, and clinics. The schools registered by these societies are 72, 19, 7, and 13 respectively.

In 1859 the Chicago Medical College, now the medical department of Northwestern University, was established to test the practicability of a thorough graded system of instruction. Students were divided into three classes, and each class was examined at the close of the year. Each of the three courses was six months in duration. Attendance on hospital clinical instruction and practical work in the chemical,

anatomic and microscopic, or histologic laboratories were required for graduation. In 1871 the Harvard Medical School adopted a similar plan. The Syracuse Medical School followed, and to-day the graded system of consecutive lectures is the rule. In 1896 President Eliot wrote substantially as follows: Within 25 years the whole method of teaching medicine has been revolutionized throughout the United States. The old medical teaching was largely exposition; it gave information at long range about things and processes which were not within reach or sight at the moment. The main means of instruction were lectures, surgical exhibitions in large rooms appropriately called theatres, rude dissecting rooms with scanty supervision, and clinical visits in large groups. The lectures were repeated year after year with little change, and no graded course was laid down. There was little opportunity for laboratory work. The new medical education aims at imparting manual and ocular skill, and cultivating the mental powers of close attention through prolonged investigations at close quarters with the facts, and of just reasoning on the evidence. The subjects of instruction are arranged, as at the Harvard Medical School, in a carefully graded course, which carries the student forward in an orderly and logical way from year to year. Laboratory work in anatomy, medical chemistry, physiology, histology, embryology, pathology, and bacteriology demands a large part of the student's attention. In clinical teaching, also, the change is great. Formerly a large group of students accompanied a visiting physician on his rounds, and saw what they could under very disadvantageous conditions. Now instruction has become, in many clinical departments, absolutely individual, the instructor dealing with one student at a time, and personally showing him how to see, hear, and touch for himself in all sorts of difficult observation and manipulation. Much instruction is given to small groups of students, three or four at a time—no more than can actually see and touch for themselves.

In 1902 there were, excluding graduate schools, 154 medical schools in the United States with 26,821 students. The growth in medical students in 32 years has been 333 per cent. Of the 154 schools 123 are regular (24,447 students), 20 homeopathic (1,551 students), 9 eclectic (746 students), and 2 physiomedical (77 students). Of the 154 medical schools, 143 held day sessions, 6 had evening sessions, and 5 did not report this item; 76 were departments of colleges or universities, 78 were separate institutions; 150 granted degrees.

More attention should be paid in the United States to instruction in hygiene and state medicine. In Great Britain no one can be appointed a medical officer unless he has a special diploma in public health. In this country little opportunity is afforded for general or special sanitary work on broad lines. This subject is now under discussion and doubtless progressive States will soon provide places where medical officers of health or other persons engaged in sanitary work can obtain practical and scientific training. The scientific investigations which would be made in the laboratories of such schools would be of great value to the public.

The earliest law relating exclusively to physicians was passed by Virginia in 1639, but like the later act of 1736 it was designed mainly

to regulate their fees. The act of 1736 made concessions to physicians who held university degrees. In only two of the 13 colonies were well-considered laws enacted to define the qualifications of physicians. The general assembly of New York in 1760 decreed that no person should practise as physician or surgeon in the city of New York till examined in physic and surgery and admitted by one of his majesty's council, the judges of the supreme court, the king's attorney-general, and the mayor of the city of New York. Such candidates as were approved received certificates conferring the right to practise throughout the whole province, and a penalty of £5 was prescribed for all violations of this law. A similar act was passed by the general assembly of New Jersey in 1772. In 1840 laws had been enacted by the legislatures of nearly all the States to protect citizens from the impositions of quacks. Between 1840 and 1850, however, most of these laws were either repealed or not enforced as a result of the cry that restrictions against unlicensed practitioners were designed only to create a monopoly.

State Supervision.—Careful attention needs to be given to the difference between a license and a degree, the one carrying with it the right to assume a title which is evidence of scholastic ability, the other the right to enter on the practice of a profession or a pursuit, both emanating from the same authority, the state, either directly or through intervening mediums. As foreigners are often puzzled to account for the diversity in our legislation, the fact is again emphasized that all matters of internal police control are left exclusively to the several states, and that national laws regulating professional practice can not be enacted. Hence the laws of the United States will be silent concerning licenses and degrees except in so far as they may apply to the District of Columbia and certain recent political dependencies.

Licensing.—The requirements for admission to practise a profession in the 54 political divisions of the United States vary as greatly in the various professions as the political divisions differ in area, extent, population and importance. However, two general items appear in full or in part in the various statutory requirements for licensing; namely, (1) the general preliminary education requirements; (2) the professional preparation. The general preliminary are given uniformly under the synopsis of requirements.

Supervision.—In medicine all political divisions except Alaska now have examining and licensing boards. In some States the stringent laws against non-medical practitioners are enforced; in others quackery receives such legal protection that any person may treat "the sick or suffering by mental or spiritual means without the use of any drug or material remedy." This is due largely to the fact that so many statutes lack specific definitions as to what constitutes the practice of medicine, and without these definitions the conviction of such practitioners can not be secured through the courts. There is much misunderstanding in this country regarding the duty of the state in relation to the health of the people. It does not consist in discriminating between schools or systems of medicine, but in requiring without prejudice or partiality of all who seek a license to practise

MEDICAL EDUCATION

for gain on the lives of fellow beings a minimum preliminary and professional training.

Medical Sects.—As commonly understood, regular physicians have no distinctive theory or practice; homeopaths treat diseases with drugs that excite in healthy persons symptoms similar to the morbid condition treated; eclectics make use of what they regard as specific remedies, chiefly botanic; physiomedicalists use only botanical remedies, discarding those which are poisonous. In practice these distinctions are not always observed. The following political divisions have mixed examining boards, that is, the boards are composed of representatives of the several schools of medicine: Alabama, Arizona, California, Colorado, Hawaii, Idaho, Illinois, Indian Territory, Indiana, Iowa, Kansas, Kentucky, Maine, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, Montana, Nebraska, Nevada, New Jersey, New Mexico, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Rhode Island, South Dakota, Tennessee, Texas, Utah, Virginia, Washington, West Virginia, Wisconsin, Wyoming.

Philippines and Porto Rico have examining boards, the former of three appointed by the commissioner of public health, the latter of five appointed by the governor.

The following have separate examining boards for each recognized school of medicine: Arkansas, Connecticut, Delaware, District of Columbia, Florida, Georgia, Louisiana, Maryland, New Hampshire, New York, Pennsylvania, South Carolina, Texas, Vermont, Alaska has no examining board. Section 460 of "an act to define and punish crimes in the district of Alaska" amended June 1900 provides that physicians, itinerant, must first apply for and obtain license from a district court or a subdivision thereof and pay for the license \$50 per annum.

Osteopathy.—"Discovered" in 1874, osteopathy (q.v.) is based on the theory that "a natural flow of blood is health" and that the bones may be "used as levers to relieve pressure on nerves, veins, and arteries." Osteopathy is now recognized by law in Arkansas, California, Connecticut, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Montana, Nebraska, New Mexico, North Carolina, North and South Dakota, Ohio, Oklahoma, Tennessee, Vermont, Wisconsin. Practice of "the system, method, or science of osteopathy" is restricted to licensed physicians and to graduates of "a legally chartered and regularly conducted school of osteopathy." The use of drugs and operations in "major or operative surgery" is not permitted in the practice of osteopathy.

Midwifery.—Special tests for certificates of registration as midwives are required in Connecticut, District of Columbia, Illinois, Indiana, Iowa, Louisiana, Minnesota, Mississippi, Missouri, New Jersey, Ohio, Philippines, Porto Rico, Texas, Utah, Wyoming. In the following political divisions the provisions of the medical practice acts do not apply to women engaged in the practice of midwifery: Alabama, Arkansas, Florida, Georgia, Idaho, Kentucky, Maine, Maryland, Michigan, Mississippi, Montana, New Mexico, North Carolina, Rhode Island, South Carolina, Tennessee, Vermont, Virginia, Washington, West Virginia. In other political divisions, though there are some special provisions for certain localities, the general

acts regulating the practice of medicine make no reference whatever to the practice of midwifery by women. It would seem, therefore, that these laws restrict the practice of midwifery to licensed physicians. Practically the conditions in political divisions where the laws seem to restrict the practice of midwifery to licensed physicians are little better than in political divisions where the practice of midwifery by women without a license is authorized by statute. There will probably be little change for the better till the midwife receives legal recognition, and the practice of midwifery is regulated by definite statutory provisions.

The following States have reciprocity clauses in the law, but they are operative in few cases only, namely: California, Connecticut, Delaware, District of Columbia, Indiana, Kansas, Maine, Maryland, Michigan, Nebraska, New Hampshire, New Jersey, New Mexico, New York, Ohio, Oregon, Pennsylvania, South Dakota, Texas, Vermont, Wisconsin.

Synopsis of Requirements, Jan. 1, 1904.—In the following political divisions medical diplomas do not now confer the right to practise medicine, an examination being required in all cases: Alabama, Arizona, Arkansas, California, Connecticut, Delaware, District of Columbia, Florida, Georgia, Hawaii, Idaho, Illinois, Indiana (after 1 Jan. 1905), Indian Territory (Cherokee and Choctaw nations), Iowa, Louisiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, Montana, Nebraska, New Hampshire, New Jersey, New York, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, Philippines, Porto Rico, Rhode Island, South Dakota, Tennessee, Texas, Utah, Vermont, Virginia, Washington, West Virginia, Wisconsin. The following require for admission to the licensing examination:

Alabama, requirements of State Medical Association.
Arizona, diploma from lawfully organized medical school.

California, diploma from legally chartered school requiring in no particular less than the Association of American Medical Colleges.

Connecticut, diploma from legally incorporated medical school.

Delaware, competent common school education, diploma from legally incorporated medical school.

District of Columbia, diploma of school authorized by law to confer M.D. degree.

Florida, diploma from recognized medical school.

Georgia, diploma from legally organized medical school.

Idaho, diploma from legally chartered medical school.

Illinois, four years of high school work, diploma from approved medical school.

Indiana, diploma from reputable medical school.

Indian Territory, Cherokee nation, diploma from reputable medical school; Choctaw, one term's attendance at reputable medical school.

Iowa, less than one year of high school work, diploma from recognized medical school.

Louisiana, fair primary education, diploma of recognized medical school.

Maine, diploma of reputable medical school maintaining an approved standard of preliminary education and medical instruction.

Maryland, common school education, diploma from legally incorporated medical school, as defined by A. M. C. A. or A. I. H.

Michigan, four year high school course or its equivalent, diploma from approved medical school.

Minnesota, four full courses of lectures at recognized medical school.

Montana, diploma from legally chartered medical school.

Nebraska, diploma from legally chartered medical school.

New Hampshire, full high school course or its

MEDICAL ELECTRICITY—MEDICAL JURISPRUDENCE

equivalent, diploma from regularly organized medical school.

New Jersey, four year high school course or its equivalent, diploma from legally incorporated medical school.

North Carolina, diploma from medical school in good standing.

North Dakota, three six month lecture courses. Ohio, full high school course or its equivalent, diploma from legally chartered medical institution. Oklahoma, diploma from a reputable medical school, or proof of ten years' practice.

Pennsylvania, common school education, diploma from legally chartered medical school.

Philippines, diploma from reputable school recognized by the Board of Health.

Porto Rico, diploma from an approved legally organized medical school.

South Dakota, diploma from a legally organized reputable medical school.

Utah, diploma from chartered medical school in good standing.

Vermont, high school course or equivalent and diploma from a United States medical school.

Virginia, evidence of a preliminary education, diploma from a chartered medical school.

Washington, diploma from authorized medical school having at least a three year graded course.

Wisconsin, elementary education equivalent to admission to junior year of accredited high school, diploma from reputable medical college.

The following require the licensing examination only: Arkansas, Hawaii, Massachusetts, Mississippi, Missouri, Oregon, Rhode Island, Tennessee, Texas, West Virginia.

The following require approval of medical diploma by duly qualified boards: Kentucky, New Mexico, South Dakota; diploma must evidence four full courses.

The following require either approval of medical diploma or examination by State or other duly qualified boards: Colorado, Indian Territory (Creek Nation), Kansas, Nevada, South Carolina, Wyoming.

The following, requiring either approval of medical diploma or examination, admit to examination on: Kansas, four periods of study of six months each; Nevada, five years practice in the State just prior to act or diploma from a reputable school without the United States; South Carolina (Regular board), diploma from any medical school.

Registration of Nurses.—Laws of New York 1903, chapter 293, in effect 27 April, amended the Public Health Law and provided for the registration of nurses. Under the act any resident of the State over the age of 21 years and of good moral character, holding a diploma from a training school for nurses connected with a hospital or sanitarium, giving a course of at least two years and registered by the University of the State of New York as maintaining in this and other respects proper standards, may receive a certificate of qualification to practise as a registered nurse and assume the title or use the abbreviation R.N. Nothing in the act confers authority to practise medicine. The Regents may on the recommendation of the Board of Nurse Examiners provided by the law, waive the examination of residents of the State 21 years old, of good moral character, of those holding a diploma from a training school or having three years' experience, and may admit on a practical examination in nursing those actually engaged in the practice of nursing when the law took effect. The waiver will expire by limitation in three years from the date of enactment. New Jersey, laws of 1903, provides for the license of trained nurses by a county clerk. Porto Rico, in the codified school law 1903, provides for the establishing of three schools for the training of nurses and places the jurisdiction of the same under the commissioner of education and president of the superior board of health. Virginia, law of 1 May 1903, is quite similar to the New York statute except that instead of R.N. the ab-

breivation of the New York statute for registered nurses, the abbreviations T.N. or G.N. may be assumed by trained nurses or graduate nurses duly licensed by the board. (See NURSE, TRAINED.)

Dentistry.—See DENTISTRY.

JAMES RUSSELL PARSONS, JR.,
Formerly of the University of the State of New York.

Medical Electricity. See THERAPEUTICS, ELECTRO.

Medical Jurisprudence, the science of applying medical knowledge to the purposes of legal investigation; the application of the principles and practice of various branches of medicine in judicial proceedings requiring the explanation of doubtful questions, such as those relating to conception and birth, time and cause of death, physical and mental diseases, etc. Medical jurisprudence is often spoken of as forensic medicine, that is, the medicine of the forum. It embraces subjects both purely medical and purely legal, and covers a very wide range. These questions have usually been considered under five divisions: (1) Such as arise out of the relation of sex, including impotency, pregnancy, legitimacy, and rape; (2) injuries to persons, as wounds, death from violence, poisoning, and abortion; (3) disqualification by different forms of mental diseases; (4) feigned disability or disease; (5) questions as to age, identity, and life insurance. The major part of what is known as medical jurisprudence relates to evidence given in courts, even if the whole subject is not properly embraced within the subject of judicial evidence. As medical books can be used only in a very restricted sense in judicial proceedings, the testimony of medical experts has become very important. Our laws do not give recognized preference to any particular class or school of medical practitioners as qualified for expert witnesses. Knowledge is the test of qualification to give such evidence. The presiding judge passes, as a preliminary, upon the question of qualification, and determines whether the witness shall be permitted to testify. The opinion of a medical expert is never conclusive but is simply to be regarded by the judge or jury in the same manner as other evidence given to assist in establishing a fact. The medical expert is frequently called upon to state facts, as well as to give his opinion based upon facts shown by other testimony to exist. He may testify as to the health of a patient whom he has treated, of his habits and mental traits. He may testify that he found poison in the stomach of a person found dead, and give an opinion as to whether the poison caused death. He may give an opinion as to how long a person has been dead, from the condition of the body when found; whether a certain wound would produce death; and his opinion as to the instrument used to inflict the wound.

In all of these subjects of investigation the evidence of a medical expert is almost indispensable. In matters of life insurance, where the insured dies shortly after a policy has been issued to him, medical expert examination and evidence are often of great importance, bearing upon the condition of the insured at the time of insurance, and upon the question of

MEDICI—MEDICINE

representations. In suits for injuries to persons through the fault of others the question of the extent and probable continuance of disability are to be investigated with the aid of expert evidence. Many questions of supposed crime could not be properly determined without the knowledge and skill of the physician, applied as science directs. In cases involving sanity and mental capacity medical jurisprudence reaches the zenith of its importance. The untrained non-scientific mind cannot measure the status and capacity of other minds. If it is difficult, sometimes nearly impossible, for the best informed to determine accurately the physical condition of a person, none but those eminent for knowledge of and experience in matters of the mind ought to judge of its condition and hazard opinions as to its peculiarities and capacity. Insanity is a disease of the mind which assumes many forms—almost as many as there are different phases in the human mind. Many definitions are given of insanity, one of which is that it is a physical disease located in the brain, which deranges the mental and moral faculties to a greater or less degree. This definition is not quoted in preference to any other for the purpose of approval, but because it differs so radically from others, and to show the difficulty of comprehending the nature of this dread malady. The general term insanity comprehends all shades of mental diseases, from the slightest abnormal condition to that of the wildest maniac. The expert alienist is called upon to testify as to a person's ability to make a will, a contract, or to transact any kind of business. He is asked to decide whether a person is bereft of his normal reason to the extent that prudence requires his confinement; and when he has been confined, whether it would be safe or prudent to let him have his liberty. The questions upon which the expert's opinion with regard to the insane, or those supposed to be insane, are asked can hardly be enumerated. The importance of the subject cannot be overestimated, and new and earnest efforts are being constantly exerted by the medical profession to render its information upon this difficult subject as full and complete as possible. Many works upon medical jurisprudence have been published, and in all of them insanity, in its various forms, has had a prominent place, while quite a number of authors have produced commendable works devoted entirely to the subject of the medical jurisprudence of insanity.

Medici, mēd'ē-chē or mā'dē-chē, a Florentine family who rose to wealth through commerce, became prominent in the affairs of the state, gained supreme power, and were in general known as patrons of literature and art. GIOVANNI (1360-1429) rendered important service to Florence, and became gonfalonier in 1421. His son COSMO, the Elder (1389-1464), was called "Pater Patriæ," gained vast wealth, was a munificent patron of art and letters, and combined statecraft with commercial enterprise. He was for 34 years the sole arbitrator of the republic and the adviser of the sovereign houses of Italy. His grandson, LORENZO THE MAGNIFICENT (1449-92) governed the state in conjunction with his brother GIULIANO (1453-78) till the latter was assassinated by the Pazzi, a rival Florentine family. Escaping from this massacre he conducted a war with Ferdinand of

Naples, with whom he signed a definitive peace in 1480. The rest of Lorenzo's reign was passed in peace and in those acts of profuse liberality and magnificent patronage of arts and sciences, in which he rivaled or excelled his grandfather. He left three sons—PIERO (1471-1503), GIOVANNI (afterward Pope Leo X.), and GIULIANO, duke of Nemours. Piero succeeded his father, but was deprived of his estates when the French invaded Italy in 1494. He finished his career in the service of France. His eldest son Lorenzo came to power by the abdication of his uncle Giuliano, who became Duke of Urbino. He died in 1519, leaving a daughter, the famous Catherine de' Medici (q.v.), queen of France. After several reverses in the family, Alessandro, an illegitimate son of the last-named Lorenzo, was restored to Florence by the troops of Charles V., and by an imperial decree was declared head of the republic, and afterward Duke of Florence. The next name of importance in the family is that of Cosmo "the Great" (1519-74), in 1537 proclaimed Duke of Florence and afterward Grand-duke of Tuscany. A learned man himself, he was a great patron of learning and art, a collector of paintings and antiquities. FRANCISCO MARIA I., his son, obtained from the Emperor Maximilian II., whose daughter Joanna he had married, the confirmation of his title of grand-duke in 1575, which continued in his family until it became extinct in 1737 on the death of Giovanni Gasto, who was succeeded by Francis, duke of Lorraine. MARIE DE MÉDICIS (q.v.) (1573-1642), queen of France, was daughter of Francisco I.

Medicine, History of. Within the past three centuries the average working life of English-speaking men has doubled. A few lived as long as now, and some strong or favored ones had efficient working powers as long; but the common life was worn out in what is now middle age. In Shakespeare's time the 50's were venerable: "Old John of Gaunt, time-honored Lancaster," was 58 when supposedly so addressed; and Admiral Coligny, murdered at 53, is described by his contemporary biographer as a very old man. Now, when we hear of a death in the 60's, we instinctively feel it an untimely cutting off, in what should be still fresh and vigorous age, and even at 80 it seems but just fair ripeness for the sickle. The three factors which have wrought this change are advanced physical comfort, medicine and its handmaid hygiene, and surgery. And in the mitigation of the frightful mass of actual pain, of physical torment which has racked every age down to the present, and which has scarcely even been alleviated till the past century, medicine stands incomparably first.

Some good foundations had been laid, it is true, in the century previous, and men were at work in the true scientific spirit. Great masters had stimulated their successors to study in the essential preliminary subjects, the constitution and functions of the body. The mighty Boerhaave of Holland (1668-1738) had revolutionized clinical observation; Morgagni of Italy (1682-1771) had "introduced anatomical thinking into medicine" (Virchow), and had done something the same service for pathology which Haller of Germany (1708-77) did a generation later for physiology; while John Hunter (1728-

93) had not only introduced capital improvements into operative surgery, but had set the pace in research into anatomical and physiological problems. But the influence of old theories, founded on guesses and imperfectly interpreted observation, still lay heavy on the body of practitioners. The chief general theories in the 18th century were those of William Cullen (1710-90) and his pupil and assistant John Brown (1736-88) of the University of Edinburgh; the former—a great advance on the older theory of “humors,” and on the right track—made the nervous system the seat of diseases; the latter divided all diseases into two classes,—the sthenic resulting from over-excitation and treated by depletion, and the asthenic resulting from under-excitation and treated by stimulation. On the Continent, Hahnemann (1755-1843), his great theory propounded at Leipsic (1796-1810) soon after took adverse ground in his “homeopathy,”—a very different thing from what later passed under the name, though the latter retained the underlying basis. Besides his “law of similars” which Hippocrates had formulated before him, he rejected theory utterly, declaring that it was impossible to know anything about pathological changes out of sight; that we can only know symptoms, and if those are removed it indicates of necessity that the disease which produced them must be gone also. He also alleged that the fact of a given dose causing certain symptoms in a healthy person was obvious proof that it must be too large for a sick one; further, that to possess healing power the dose must be too small for recognition by the senses or chemical analysis; and that trituration, or dilution and shaking, of minute doses caused molecular changes which infinitely increased their power—“dynamization,” he termed it. The exaggeration of symptomatics and empirics was a reaction against the current reliance on unbiased theories; the paradox of infinitesimal doses, against the monstrous boluses and draughts with which patients were often gravely injured; there was usefulness in both reactions, but he went so far as to declare that a child could be cured while asleep by holding the pellets near it.

But the reign both of guesswork theorizing and of groping empirics, as exclusive methods, was coming to an end, and the first great blow was delivered in the first year of the century. France now came to the front where other countries had thronged. Bichat, a genius who wore himself out at 31 as did Clifford at 34, published the year before his death (1801) a work on general anatomy, in which he remade the entire science by showing that the different organs have membranes and tissues in common, and therefore that the seat of disease was in the constituent tissues and not in the organs as such. This not only simplified anatomy and physiology in much the same way that the alphabet simplified hieroglyphics, but threw the investigation of pathological changes into an entirely new channel. Parallel with this work, the followers in the footsteps of Morgagni were carrying on his work in studying morbid anatomy, the appearances of diseased organs; this too was remodeled on Bichat's discoveries. In 1808 and 1816 Broussais of Paris (1772-1838) published valuable works whose theory is merely

the sthenic and asthenic idea of Brown, but which led to renewed research in pathological anatomy and local ailments. Percussion had been devised by Auenbrugger of Vienna (1772-1809) in 1761, and Corvisart of Paris (1755-1821) revived it; but a greater effect was created by the introduction of auscultation 1816-19 by the Breton Laennec (1781-1826) at Paris, where he was Corvisart's pupil. He invented the stethoscope to diagnose diseases of the lungs, heart, and abdominal organs, by means of alteration in the normal sounds of their action; and his own use of it, and observations on the diseases of these organs, were the greatest advance made in clinics since Boerhaave, and may be said to have founded modern clinical science. In 1827, Richard Bright at London (1789-1858) first published his recognition of the true nature of the kidney disease since called by his name, and of the general characteristics of renal complaints, the foundation of our knowledge of them.

A special branch of investigation and analysis in the first half of the century was in discriminating the continued fevers; one of the most active and anxious battle-grounds for practitioners and theorists since modern medicine took its rise; though eruptive and malarial fevers were well differentiated. The first to be discriminated was typhoid, by Louis of Paris (1787-1872). His American pupils, W. W. Gerhard (1809-72) and Alfred Stillé (1803), with C. W. Pennock (1799-1867), all of Philadelphia, and George B. Shattuck of Boston, proved that typhoid and typhus, theretofore loosely classed together, were independent diseases, though generated by similar causes. This was confirmed by the work of A. P. Stewart at Glasgow and Sir William Jenner at London. Dengue or break-bone fever, yellow and relapsing fevers, and their kind, were carefully studied. Among the other names associated with this labor are R. J. Graves (1797-1853) and William Stokes (1804-78) of Dublin, George Budd (1808-82) of London, and Daniel Drake (1785-1852), S. H. Dickson (1798-1872), and Austin Flint (1812-86) in America. This work was soundly based by 1860 in regard to fever clinics.

Development in the United States.—When the 19th century opened there were only three medical schools in the United States, and only two of importance,—those connected with Harvard College and the University of Pennsylvania, —and only two general hospitals. Medical education was somewhat on a footing with divinity education: physicians took apprentices for some years, and clergymen took private pupils in divinity. Those who wished and could afford a more systematic medical education went to London or Edinburgh. The literature of the profession was English and (translated) French almost wholly; Rush and a few others had published books, but not of moment, and there were only two or three medical journals. There were but two medical libraries except in private hands, those at the New York and the Pennsylvania Hospitals. The physicians of most reputation were Benjamin Rush and Philip S. Physick of Philadelphia, David Hosack and Samuel L. Mitchell of New York, and James Jackson and John C. Warren of Boston. The smaller places did not lack for able men, though of less wide-

MEDICINE

spread repute: such as Daniel Drake of Cincinnati, and Nathan Smith, founder of the medical schools both of Dartmouth and of Yale. But the great repute of the French medical investigators in the first quarter of the century—Bichat, Corvisart, Laennec, Louis, etc.—took an increasing number of American students there, and the new spirit they brought back revolutionized American practice for a time. The enormous increase in American population, however, enlarged the demand upon its stock of medical knowledge far faster than that could be legitimately developed: educated physicians could not be turned out so fast as the thronging populace needed them, and it was the golden age of the half-educated. Perhaps, too, the masses had the same ideas of the needlessness of training in medicine as in public life. The machinery was multiplied indefinitely, and the product turned out depreciated in proportion. Up to about 1870 the medical schools sprung up everywhere, both public and private, and their competition for pupils degraded the standard very low indeed. Diplomas were given for two years' work, and short sessions at that; and the instructors were sometimes as incapable of giving competent education as the authorities were unwilling to enforce severe study or careful experiment. The first place to exact a new and much higher standard was Harvard, about 1870. The rapidity with which the rest of the country, in the better institutions, followed its lead, showed that there was a large instructed upper class which appreciated the need of thorough education in this as in other departments of knowledge, and understood that medicine was a great science as well as a delicate craft. As always, the rich were glad to give when they knew where to give intelligently, and endowed generously both study laboratories and general and special hospitals. It would be a grateful task to enumerate these, did space permit: here can be mentioned only such names as Pierpont Morgan and Andrew Carnegie, Johns Hopkins and Vanderbilt, Sims, Strathcona, Mount-Stephen, Payne, and Lane.

Methods of Investigation.—The last century of course did not invent experiment in medicine or physiology: the method was recognized by the great Greek and Latin physicians, used by the two great Bacons, Roger and Francis, fully developed by Harvey, and utilized with superb skill by Hunter. But though these great men did not lack sound ideas, they lacked tools and the mass of laboratory facilities gradually built up in our age. The research laboratory is the development of the 19th century, and well along toward the middle of it. The workers in it experiment along three main lines,—the condition and functions of the organs in a state of health; the nature of the functional changes produced by disease, and the causes of the changes; and the prophylactic or curative agencies which can neutralize the disturbing agents. The results of these studies have created a new knowledge, which is to that of even 1800 like the relation of an adult to a baby. The physiological and pathological revelations have not merely left the knowledge accumulated in the previous centuries possessed of a merely archaeological interest, but they have weaned us from the sway of any authority whatever; recognizing

that even the seemingly soundest conclusions of the present are but working hypotheses, which may have to be abandoned at any time on fresh evidence,—the true scientific spirit. No part of life has been left as it was, the digestive and assimilative, circulatory, respiratory, and excretory, reproductive and directive functions have all been illuminated by a flood of light. Especially has this been wonderful in the study of the brain, whose functions not only are so intangible and elusive, but apparently so impossible of experimentation without destroying the subject of experiment. Not only have we penetrated deep into the secrets of the paths and operations of sensory and motor impulses, the localization of functions, and the mechanical implements of thought and memory, but we have been enabled to apply with great success a number of curative measures not before dreamed of, or even if so, not deemed possible of use.

Another marked feature of the age is the development of specialism, in which we have to set off a lack of co-ordination and breadth of knowledge or judgment against an extension of knowledge not possible by any other method. Scientifically, no other means has been so potent in extending and deepening the realm of demonstrated fact. Practically, no other has been so effective in developing curative processes. This specialism must not be confounded with that of the "lung doctors" and "fever doctors" of former days, mere guesswork empiricism of uneducated practitioners; it rests on a basis of competent general medical knowledge and thorough education in the specialty besides. The physicians who give their time and thought to one limited field—diseases of women, of children, of eyes and ears, of throat, of teeth, of the brain, or who, though less exclusively, choose diseases of the heart or the liver or other organs for their preferred field—have won for the profession some of its most signal triumphs. American physicians especially have stood at the very head of those who have perfected dentistry and ophthalmology, as well as gynecology or diseases of women. In this branch the blessings they have conferred not only on women in ordinary disease, but on both them, their male relatives, and their children, by the saving of life and health, in the special crises of the sex, cannot be estimated.

One of the finest branches of this specializing is that of alienism: and the change in the mental attitude of the public toward it in consequence of that study has been most remarkable and gratifying. From a matter of derision, as it was largely in the Middle Ages, or ineffectual commiseration as an act of God, or mere terror and aversion, it has come to be sympathetically studied, often relieved, and always recognized as a mere functional disease. Starting from the labors of our own Rush, of the English Tuke, of the German Jacobi and Hasse, and the French Pinel and Esquirol, this reform has built up a body of physicians in every civilized country not only to study mental aberration scientifically, but to introduce humane and rational methods into its care and cure. America is not behind any other in the treatment of the insane; but the curse of so many good causes in America—politics—is a blight upon this science still in too many States.

Prophylactics.—"Prevention is better than cure" has reached its most brilliant exemplification in the 19th century. It is true that nations far back in antiquity have grasped some of the chief conditions under which diseases most prevail, and have even carried systems of public hygiene much farther than even yet we have re-attained to. The law of Moses furnishes a remarkable example, in its insistence on cleanliness, isolation, and diet; the Greeks systematized diet and exercise and general physical training thoroughly, their ideal being "the fair mind in the fair body" (and had discovered that professional athletes do not make good soldiers, from lack of endurance); the Romans and Greeks made the bath almost a fetish, far beyond even the English, and the public benefactor of the day gave his city baths, not libraries. But modern science goes much farther: it discerns the causes which create the disease itself, and removes or neutralizes them. In the 18th century some light had been thrown on this: Howard had seen that typhus was in direct ratio to the crowded condition of jails, Captain Cook and Sir Gilbert Blaine had perceived and removed the conditions that generate scurvy, Jenner had gone still farther and anticipated the methods of modern preventive medicine by vaccination. But all these could only be feeble and groping attempts until there was a scientific basis for them. This was furnished by bacteriology, and a few words upon that are needed to make later explanations intelligible.

The Bacteriological Basis of Preventive Medicine.—The ancients speculated with great eagerness and sometimes acuteness on the origin of life, and had guessed that disease and living germs were in some way related; and the relation of disease and putrefaction was not doubted. As soon as the first weak crude microscope was invented, it was used to investigate the organisms of decay. The Jesuit Kircher in 1671 examined the "minute worms" in putrid milk and cheese and meat; in 1675 a Dutch merchant named Leeuwenhoek improved his lenses and studied the "animalcula" in rainwater, saliva, intestinal fluids, and putrid substances; and the physicians of his day were quick to suspect and suggest that these organisms might be the cause of all diseases. In 1762 the Viennese Pleincz, who had studied fluids in all conditions, gave his firm adhesion to this belief. But this was not the whole; whence came these organisms—were they self-generated, or simply transmitted from other bodies and multiplied? Despite even the microscope, the theory of spontaneous generation maintained itself tenaciously far past the middle of the century. A distinguished chemist maintained as the result of careful experiment that germs were so generated, and even the proof that the organisms were forms already existent did not convince him or his followers. It was reserved for Pasteur in 1861, and finally (with Koch and Cohn) in 1876, to crush this theory forever. Following quickly on the first came the discovery of the anthrax germ by Pollender and Davaine in 1863; shortly afterward Lister's epoch-making researches into wound infection, making possible the triumphs of antiseptic surgery; then swiftly followed the isolation of the germs of relapsing fever, leprosy,

and typhoid. But towering above all, from the enormous difficulties overcome, were Robert Koch's isolations of the tuberculosis germ in 1882, and of that of Asiatic cholera in 1884. Thence on, a crowd of discoveries of the germs of other diseases have left but few—unfortunately, some of the worst—unrevealed, diseases of animals and insects having been investigated as well as those of men.

Thus much for the history of discovery: but what are these germs? The popular mind is very confused on the subject. Bacteria are generally thought of as a sort of worm. In fact, they are not members of the animal but the vegetable kingdom; the smallest organisms known. They are protoplasm, a jelly-like substance, enclosed in a hard membrane exactly like wood fibre. They are classified by shape in three groups: cocci (spherical), bacilli (rod-like), and spirilla (corkscrew or undulatory shape). The cocci are found in pairs, fours, clusters, or chains; they include the smallest known organisms, some of them being as small as $1/150,000$ of an inch in diameter. The bacilli are larger, but vary much: from $1/25,000$ to $1/4,000$ of an inch in length, and $1/125,000$ to $1/16,000$ in diameter; some of them have organs of locomotion, called *flagella*. The spirilla are longest of all, sometimes $1/600$ of an inch. They all increase either by fission into two, or by developing a spore or seed. Their rate of multiplication does not seem rapid, but that is because we forget our old arithmetical "catches." A bacterium dividing each hour, and each division thus dividing, would obviously have increased to 8,388,608 in 24 hours; and in three days to a number beyond all verbal expression, weighing nearly 7,500 tons. Of course this is a *reductio ad absurdum*, as the body they feed on would be exhausted early in the series; but outside of starvation, nature has other ways of arresting their multiplication.

Before discussing this point, let us look at the nature of bacteria as a whole. It is a misapprehension to think of them simply as a principle of disease and death. They are a universal principle of life as well, and the few species which cause harm are lost in the myriads which do good. But for them, organic existence would perish; it has been suggested that the first organic things on earth were bacteria,—organisms needing only nitrogen for support,—and life means their multiplication. They abound in air and water, in the soil to nine feet deep or so, and in the outsides and insides of all organisms; but naturally their number varies with the conditions for sustaining existence, and there are none at extreme altitudes or in glacier ice, and few in the polar regions or the deep seas. Those conditions are (1) moisture, without which all die; (2) air, as to which there are three classes,—aerobes which must have it, anaerobes which must not have it, and facultative anaerobes which care nothing either way; (3) food, which must be living tissues for a few, may be dead ones for most, and can be mineral salts or atmospheric nitrogen for some; (4) temperature, which has for possibilities of their multiplication, though not of their life, extremes of 32 and 170° F.; for an average most favorable tract 60 to 104° ; and for disease germs (as evolution would imply) is most favorable

98.4°, or blood heat; (5) light, of which direct sunlight is death to all, and common daylight, of no importance either way to most.

Their enormous number gives them a power of accomplishment seemingly almost miraculous, and certainly far superhuman. The quality of farm products and dairy products, of fatted stock or wool, of hides or horn, and many other familiar articles, is due to them; and they are the scavengers of our water supply from pollution, as well as some of them deriving powers for harm from it. Still more to our surprise, peas and beans certainly, and all plants probably, gain their life from the soil through the medium of bacteria which live in their roots, decompose nitrogenous minerals and feed on atmospheric nitrogen also, turning both kinds over to the plant for its nourishment.

Hence the processes of health and disease alike are functions of bacteria. What medical science has specially to do is to trace the progress and manifestations of that spread of harmful bacteria commonly called "infection," and the methods by which the system's natural tendency to starve or poison them can be reinforced. Before entering upon the phases of prevention and cure, we must indicate briefly how they obtain entrance, how they produce their effects, and what is the reaction of the body thereupon.

The first is naturally limited in variety: they enter by being injected from the bites of animals or insects, from wounds or abrasions, from inhaling infected air, from eating or drinking substances containing them. Specific cases will be considered later. The action of the microbes is by generating a set of poisons known as toxins, which produce either languor, loss of appetite, and vague general discomfort, or more active pains, headaches, fever, inflammations of the tissues, perhaps entire stupor. The action of the body is complex and difficult, and not thoroughly worked out; but some things are known. The normal blood and tissues have a germicidal power, varying in different bodies even of full health, and varying still more as to specific germs, each body having its own set of germs to which it is congenial or maleficent. The struggle of the body against their multiplication, dependent on this unfavorableness of soil for their propagation, is called "general resistance," and on its strength depends the immunity against ordinary disease; and the secret of inoculation is, that if the soil favorable to the propagation of a specific bacterium is eaten up, it is usually very slow in fresh growth. The disease microbe gains no lodgment because there is nothing to live on. But in addition to this passive resistance, an active one is carried on by the white cells or "leucocytes,"—the wandering cells, and those of the tissues chiefly invaded, as well as those of the spleen and lymphatic glands; these and others seem to work among the toxins and produce a change in their chemical constitution, at last elaborating counterpoisons or *antitoxins* which neutralize the first, and enable the cells to carry on the war against the disease microbes till one or other is overcome; and as said, if there is recovery, a partial or complete immunity is afforded against further ravages of the same class of microbe.

But it is evident that if this process can be shortened and made more certain, so that the antitoxins can perform their work before the

disease microbes arrive at all, a great system of prophylactic or preventive medication can be had; and if the antitoxins are used in a case of similar disease, they will strengthen the natural power of the body to develop them, and greatly aid it in throwing off the disease. This is the new system of serum-therapy, begun by Pasteur in 1877, and continued by a set of brilliant experimenters since. The serum of the infected blood is chosen as a medium for injection into the blood of the patient. Pasteur with fowl cholera, Raynaud with cow-pox, Salmon and Smith in this country in 1886 with hog cholera, fully proved the possibility of the treatment, curing animals previously inoculated with the most virulent disease poisons, and rendering healthy animals immune; but these excited but languid interest till Behring's announcement in 1892 of a diphtheria antitoxin, with incontestable proof of its value. Oddly, not only laymen but physicians in many cases opposed it; partly from misunderstanding, partly from humanitarianism as involving experiments on animals. Most of its opponents have now been won over, from the crushing weight of evidence, and the brilliant work of its supporters. Diphtheria alone has reduced its mortality one half since the introduction of the serum treatment little more than a decade ago.

To illustrate the general methods of preparing all the serums for infectious diseases, that of diphtheria will serve as a model. The bacilli are cultivated for eight or ten days in alkaline beef broth, found to develop a peculiarly virulent poison under its work; the toxin is then isolated and its strength precisely estimated, then set aside in sterilized vessels. A healthy horse, found by experiment the most suitable animal, has injected under the skin of its neck or fore-quarters 20 cubic cm. of toxin and perhaps half that of antitoxin, three times five days apart; then it is given heavier and heavier doses of toxin alone, a week apart, till it can endure doses speedily fatal at the outset. After two months it is bled and its serum tested; if satisfactory, it is dosed as before for another month, when the maximum quality of serum is usually reached. The animal is then bled sufficiently, the blood being caught in a sterilized vessel and placed in a refrigerator. The coagulation finished, the serum is drawn off from the clot and its strength accurately determined in the laboratory, an antiseptic is added to keep it, and it is bottled for use. Antitoxins for tetanus and snake bite have been similarly prepared, and the present century will see probably every infectious disease and every venom with its bacterial antidote.

Specific Results of Preventive Treatment.—An abstract of the work already done in preventive medicine can best be given by a note of the great maladies of men and animals more or less controlled by it, with their bacteria. But it must be noted that of the ones cited, the bacteria of smallpox and hydrophobia (though the former has been almost exterminated by vaccination), as well as scarlet fever and measles, have not yet been isolated. The reason may be excessively small size, since that of cattle pleuropneumonia is barely visible under the microscope; or it may be that the organisms are not bacteria but unknown beings.

The diseases may be classified variously, and some admit no special classification, but we will begin with the great scourges which have desolated the world in the past, and which have owed their virulence and destructiveness, though not their direct origin, to filth and overcrowding and general unsanitary conditions.

(1) The Great Plague, or Bubonic Plague. The frightful devastations of this in the past need not be recited; it will be remembered that it was the "Black Death," which swept off from a third to a half the population of Europe in the latter part of the 13th century. Long thought almost extinct, it reappeared with fearful intensity at Hong-Kong in 1894, spread to India and had several occasions of violent outbreak, raged in Turkey and on some parts of the Mediterranean coast, and in small volume has shown itself in Glasgow, South American ports, New York, and San Francisco. But in western Europe and America it has been easily put down, and serum inoculation has been fairly successful in India. Its bacillus is known to enter the body by wounds of the skin, and very largely by bites of fleas from infected rats.

(2) Asiatic Cholera. This terrible plague even in the middle of the 19th century swept away thousands of lives in America; now it has been so thoroughly controlled that it is not feared even to the extent of disturbing commerce when it appears. It originated on the banks of the Ganges in India, where Koch found its spirillum and the means of its spread,—almost entirely through drinking infected water, though very slightly by contact,—so little that since 1873 the disease in Great Britain and the United States has never got farther than the port of entry. How thoroughly a city's immunity depends on its water supply is strikingly shown by the twin city on the Elbe in 1892; Hamburg, using the unfiltered river water, had about 18,000 cases and 8,000 deaths; Altona, with a filtration plant, had 516 cases, largely refugees from Hamburg.

(3) Typhus Fever. It is hard to believe that this was once so steady and frightful a curse in the West that one investigator says its history would be that of Europe. In all the large cities, in camps and ships, hospitals and jails, it was almost permanent, and its rate of mortality appalling. It depended so entirely on filth and overcrowding that mere city sanitation and cessation of packing, sewers and a good water supply, have practically exterminated it except in a few slums. The rate has been reduced in England from 1,228 per 1,000,000 in 1838 (typhus and typhoid together, not then discriminated) to 137 typhoid and 3 typhus.

(4) Typhoid Fever. This disease, long identified with typhus, is now not only known to be separate, but dependent on somewhat different generating conditions. It depends not so much on dirt and crowding as on sewer gases and contaminated water and milk. Given pure water and perfect drainage, a city practically has no typhoid,—except when its milk supply is drawn from infected sources, as often happens; while seaside resorts are notorious generators of the disease, from the sand-driven wells and the crowded privies draining into them. The germ was discovered by Eberth in 1880, and called *bacillus typhosus*. The continued prevalence of

the disease in our cities is due partly to the great hardness of the bacillus, which can exist in the body of a patient long after recovery, and be a means of contamination. The outbreak in the Spanish-American war seemed due to overcrowding, but more likely to the contaminations caused by it, as in the seaside cases. In the country districts there is no mystery about it: often there is no rural sanitation, and even the wells are grossly neglected, sometimes on a slope below a barn. In the typical example at Plymouth, Pa. (about 8,000 people), the evacuations of a typhoid patient were thrown out during the winter on the banks of a stream which fed the town reservoir; the spring thaw carried them into it, and the town had a typhoid epidemic which struck down 1,200 people. The proper precautions are the use of boiled water, and of distilled-water ice, the thorough inspection of dairy surroundings and water sources, and great care on the part of physicians and nurses to disinfect discharges, are the true prophylactics.

(5) Diphtheria. This bacillus was discovered in 1883-4 by Klebs and Loeffler, and has been given their joint names; it enters either by inhalation or the stomach. The antitoxins thus made possible of preparation have reduced the mortality one half; the hygienic precautions have greatly reduced the primary prevalence. The latter are isolation and disinfection, watchfulness during convalescence, careful examination of the least throat disorder, and—since the mild and often unsuspected cases where the children go about and to school freely are the worst in spreading the disease, because not guarded against—regular inspection of school children's throats. Children's teeth and mouths should also be carefully attended to, and the tonsils removed where tonsillitis is frequent.

(6) Yellow Fever. The germ of this has not yet been isolated. Its dependence on dirt, however, would seem almost as close as typhus, thorough sanitation having practically eradicated it in its favorite tropic home, Havana, and in the Southern cities once ravaged by it. Jamaica has been almost freed from it in the same way.

(7) Smallpox. This once widespread and sometimes destructive scourge, almost more dreaded for life than for death, has been so nearly eradicated by vaccination, and vaccination alone, that the persistence of a strong section of the community opposed to it is one of the strangest of phenomena. The evidence is overwhelming. Wherever smallpox breaks out, it is in an unvaccinated district, country, or body of people, and the fatalities are almost all among the unvaccinated and never among the re-vaccinated; where two bodies of men lie side by side under the same conditions, as the French and German armies in 1871, the vaccinated body scarcely suffers, the unvaccinated one is decimated; and in Egypt, where the natives are compulsorily vaccinated and the foreigners escape it, the fatalities are five foreigners to three natives, though the latter are far poorer, worse housed and fed and medically cared for, and would naturally be supposed the chief victims. If all the people of a country were vaccinated, and re-vaccinated at fair intervals, the disease would absolutely disappear, as it has in the German army: it is the ones who escape vaccination that

maintain its existence. The ravages still among the unvaccinated French Canadians are a constant example of what it has been. For instance, on 1 April 1885 there was a smallpox death in the Montreal hospital, the Hôtel Dieu; the patients who had not had it were sent home; the disease spread like wildfire, and by the end of the year 3,164 persons died of it, the city's business for the winter was destroyed, and the loss was millions. It has been proved that not above one in 100 of the vaccinated takes the disease when exposed, and almost none die; of the unvaccinated, fully 99 per cent take it and 25 to 30 die. It must be remembered, however, that there cannot be perfect security without frequent re-vaccination, as the power of the cowpox varies with different persons and is rarely permanent, sometimes not over a year or two. With animal lymph there is no danger of the introduction of other diseases, the fear of which is made an excuse for refusal.

(8) Tuberculosis (including "consumption" of the lungs), called by Holmes the "white plague"; the most destructive single agency of death, and responsible for 120,000 deaths a year in the United States, more than all other infectious diseases together, except pneumonia. Formerly believed hereditary (the truth in a very slight degree), it is now known to be the product of a bacillus, isolated by Koch in 1880-2; and the hereditary conditions are mainly environment, with some tendency to anæmia. The communication, though in a few cases by infected milk, in the overwhelming mass proceeds by inhalation of the particles of dried sputum from other consumptives' lungs, blown about in the dust of streets or houses, or even wards of hospitals. Naturally, the greatest mortality is in places where free circulation of air is not possible, as jails and "institutions." Nature seems to have provided for the largest possible distribution of them: one patient not in extremes has been known to give off from two to four thousand millions of germs in 24 hours; they are shaken from handkerchiefs, from the beard or mustache, from the furniture and other things handled by consumptives, beaten up from contaminated floors. So universally diffused are they that it seems probable there are few persons who have not some tuberculous lesion of some organ, for it is not confined to the lungs. The great weapons against it are, first, maintaining the standard of nutrition and cleanliness as high as possible; with careful protection of the chest; second, the education of the public in the dangers of the dried sputa; third, enforcement of notification and registration of cases; fourth, public sanatoriums for treatment of early cases; fifth, special hospitals for incurables. Immense progress has already been made: the rate in Massachusetts, one of the chief seats of the disease, has fallen from 42 to under 21 per 1,000 since 1853; and in New York, Glasgow, and other great cities the drop has been similar.

(9) Pneumonia. Frankel in 1886 isolated this germ, a coccus growing in pairs and chains and entering by inhalation; and with one fifth of healthy persons, present in the saliva. This is almost the one disease which has not diminished under medical and hygienic science, and has apparently increased, ranking next to consumption in deadliness. It is especially a disease of languid circulation, as in the aged (their

typical disease) and invalid and the intemperate; but it lays low vast numbers of the strong as well. The treatment has been revolutionized from the bottom, but still from one fifth to one fourth of all attacks are fatal. Thus far the most valuable novelties have been measures to prevent sudden heart failure.

(10) Malaria. Till a generation ago, this was one of the obscurest diseases on our list; it still remains one of the worst drawbacks to civilization, preventing general Caucasian settlement in the tropics. It was known to have an intimate connection with wet ground, marshes or the building up and sewerage of new districts; to prevail chiefly in the fall, and be caught chiefly from dusk to dawn; and to be non-contagious. But nothing more was known till M. Charles Laveran, a French surgeon who had gone to Algeria specially to study the disease, discovered the germs in the red blood-corpuscles of patients: not bacteria, but small protoplasmic bodies which begin as transparent rings inside the corpuscle, feed and enlarge on its coloring matter and form blackish grains from it, and on attaining a certain size divide and redivide in vast multitude, giving off a toxin which causes the acute spasm of fever, and apparently of chill also. Each variety of the fever is caused by a special form of the parasite. It was suggested by Dr. Patrick Manson of London that the communicating agent might be mosquitoes, also products of wet ground and active after dusk; and an army surgeon of India, Ross, found that mosquitoes did transmit similar parasites between birds,—developing them in their stomach cells into filary bodies, which pass into the saliva and so through bites into the bodies of others. It is now thoroughly established that this is the chief means of transmission among human beings. The mosquito is not the common *Culex* of the northern United States, but chiefly the *Anopheles*, which develops and transfers the parasites as just described. The crucial experiments are, that these mosquitoes, allowed to bite malarial patients, and subsequently healthy persons in non-malarious regions, infect the latter, and that in the deadly *campagna* around Rome, two persons during the worst season, from 1 June to 1 Sept. 1900, lived entirely immune by simply keeping behind tight netting after dusk, while exposing themselves freely during the daytime. The net result is, that swamps and stagnant pools should be drained, that persons having malaria should be thoroughly treated with quinine so that they may not transmit the disease if bitten by mosquitoes, and that Europeans can live in the worst districts by not being out after dusk and by thoroughly wiring their houses.

(11) Venereal Diseases. These are in one respect by far the worst of all we have to mention; for they are the only ones transmitted in full virulence to innocent children, to fill their lives with suffering, and which involve equally innocent wives in the misery and shame. In the victim, the infection does not stop with the parts originally affected; and it has not been seriously checked, from the nature of its causes making it impossible for society to stamp out or much diminish the actions which involve it. Physicians and the public have each solemn duties in this matter: the former, to act as apostles of continence, especially with the bache-

lors who pretend to believe that their health needs the indulgence and will not marry, and to use every effort to prevent the disease being carried to others; the latter to let no scruples of delicacy or affected ignorance stand in the way of thorough public supervision. The opposition to this is natural: women feel it adding an unfair stigma to an already shameful load of injustice; decent people feel that legal recognition is legal palliation and defense; and there is the real danger shown by experience, that if it is once shielded by the law, the weight of the police force will be thrown on the side of protecting instead of abating houses of ill-fame, as with liquor saloons but with far more disastrous results. But any risk is preferable to the present shocking conditions, which make city brothels a stream of contamination to what should be the purest of homes.

(12) Puerperal Fever. Remembering not merely the former fatality of this disease,—terribly frequent in private practice, and in maternity institutions rising from five even to ten per cent,—but the double bereavement it usually involves, the almost entire extermination of this disease is one of the grandest triumphs of modern medicine. Its contagiousness had long been suspected, when Oliver Wendell Holmes in 1843 published a full and clear statement of the facts leading to the belief; but for many years the profession generally scouted it,—a wit and poet could be no authority in medical science. Others gradually took his view; but it was the Lister antiseptic treatment which enabled it to be fully tested. Now the mortality is but about one third of one per cent.

(13) Hydrophobia. This disease, though widely distributed among animals, is not very common among human beings in America, but excites a widespread horror from the multitude of pets, any one of whom may chance to be stricken and to communicate it; in Europe it is less rare. The germ has not been isolated; but Pasteur ascertained its calculable effects on the nervous system, and that certain inoculations could render healthy animals immune and neutralize a powerful dose of the virus. He founded an institution in Paris for its treatment, and the mortality among those bitten by certainly rabid animals was reduced to less than one half of one per cent. In dogs, quarantine and muzzling are the only precautions.

(14) Leprosy. This is caused by a bacillus which probably enters the body through abrasions of the skin, and probably only from contact with another person; even so, it is but slightly contagious, contrary to the popular notion. It was discovered by Hansen in 1879, and since then an active and very hopeful investigation into prophylactic conditions has been carried on. Known to be old and widespread in Asia, it is not generally known that it came into San Francisco with the Chinese, that the Norwegians have given it a considerable foothold in the Northwest, and that in Louisiana there is an endemic condition of it, and slightly in some other Southern States. It exists in New Brunswick likewise. Still more important for the United States is its great abundance in Hawaii and the Philippines. It can be readily kept in check by segregation and inspection.

Some other bacilli may be mentioned, of which the discovery has not as yet been followed

by large results in prevention. The deadliest known is that of lockjaw or tetanus, discovered by Nicolaier in 1884; it enters by wounds, and in some tropic parts all lesions tend to develop tetanus as surely as other sections do gangrene. Influenza, or "the grip," has one of the smallest bacilli known; it is spread by dried nasal discharges, and enters by the nasal tracts. Anthrax is a disease mainly of cattle and sheep. Its bacilli were the first micro-organisms of disease to be isolated, and can enter either by inhalation, infected food, or abrasions.

Changes in Therapeutic Method.—It is only re-stating the same fact to say that new practice has followed on new theory, or rather new scientific knowledge of the nature of diseases. The only object of acquiring the knowledge was to embody it in practice. With the discovery of the zymotic principle in disease, traced finally to bacterial action, there could not be the same or like treatment as when the body was supposed to be possessed by conflicting "humors"; or when a fever was supposed to be an abnormal increase of vital fluids needing to be drained off; or when diseases were supposed to have no relation to any function of the body except the organs furnishing the dominant symptoms; or when one school supposed them waves of some sort, to be overborne by more powerful waves of the same class, and another school refused to entertain any theoretical suppositions at all, but relied on the history of cases, printed or traditional or experimental. But it may be said that the greatest revolution in the century, or at any rate the last half of it, is in the position assigned to drugs. At the outset, the old faith in bleeding still held great sway: Boerhaave himself had made almost the whole art of medicine consist in its proper application, and at the end of the 18th century Washington had been sacrificed to it. But by the middle of the century it began to diminish. Both the homœopathic and the regular schools based their practice, and many still base it, on the study and administration of drugs. They differed in the size and strength of doses, from huge boluses, or powders or draughts whose efficacy was supposed to be in proportion to their nauseousness, to small bland triturations or dilutions; but not in the assumption that in them lay the one efficient method of dealing with disease.

The advanced school of the present does not discard medicines; so far from it, it studies them with more care than ever, and values a few, well tried and certain of quality and action, as highly as ever. It knows the mass of current medicines to be inert or worse, uncertain of action and applied to human functions of still more uncertain action; but it seeks to study thoroughly and apply scientifically the few real medicines or healing agents which must be used,—quinine and digitalis, and opium, iron and mercury and iodide of potassium, etc.—instead of a swarm of dubious and varying materials. It is significant that some of the stand-bys are extremely old; iodine, as ashes of burnt sponge, was known in classic times, and ergot impressed its peculiar action on stock-raisers' minds from very early ages; even Peruvian bark is nothing new. We have not as yet made as many additions to the stock of panaceas as we might. But chemistry has done vast services for us, and will probably do far more. Aside from the dis-

MEDICINE

covery of new substances like cocaine, it has given us the active principles, of calculable strength and purity, in place of crude drugs of varying strength at best, and of varying purity and age; and there is no reason why we may not have new specifics as sure (and for as important diseases) as quinine.

But the new school does not feel itself under obligation to give any medicines whatever, while a generation ago not only could few physicians have held their practice unless they did, but few would have thought it safe or scientific. Of course there are still many cases where the patient or the patient's friends must be humored by administering medicine or alleged medicine where it is not really needed, and indeed often where the buoyancy of mind which is the real curative agent can only be created by making him wait hopefully for the expected action of medicine; and some physicians still cannot unlearn their old training. But the change is great. The modern treatment of disease relies very greatly on the old so-called "natural" methods, diet and exercise, bathing and massage,—in other words, giving the natural forces the fullest scope by easy and thorough nutrition, increased flow of blood, and removal of obstructions to the excretory systems or the circulation in the tissues. One notable example is typhoid fever. At the outset of the 19th century it was treated with "remedies" of the extremest violence,—bleeding and blistering, vomiting and purging, and the administration of antimony and mercury and plenty of other heroic remedies. Now the patient is bathed and nursed and carefully tended, but rarely given medicine. This is the result partly of the remarkable experiments of the Paris and Vienna schools into the action of drugs, which have shaken the stoutest faiths; and partly of the constant and reproachful object-lesson of homœopathy. No regular physician would ever admit that the homœopathic preparations, "infinitesimals," could do any good as direct curative agents; and yet it was perfectly certain that homœopaths lost no more of their patients than others. There was but one conclusion to draw,—that most drugs had no effect whatever on the diseases for which they were administered.

These "natural methods" have been indicated above; but some further analysis of the individual elements is worth while. It will be noted that this is not, as a hasty reader might assume, the discarding of all the results of civilization and a return to barbarism. That the natural methods are efficient is precisely because scientific knowledge and modern improvements in appliances, as well as the thousand civilized devices for comfort and cleanliness, unattainable even a generation ago, have raised them to the level of first-rate therapeutic agents.

Perhaps foremost in the rank is the trained nurse, who is not only a greater agent of philanthropy than many professed altruists, but sets free the physician from a load of care and anxiety. In place of ignorant and stubborn, usually conceited and often superstitious women, who pride themselves on defying all the doctor's commands, these intelligent and loyal women can be relied on to carry out all his injunctions, to watch carefully for indications of danger, and to furnish notes enabling him to view the progress and hourly changes of a critical case.

The importance of diet in therapy, and indeed in the preservation of health before the system becomes a subject for the physician, has never been wholly lost sight of; but at no time has it been so thoroughly recognized, so firmly insisted on, raised to so high a place in therapeutic agencies. Too much food, improper or ill-prepared food, over-haste in eating, all have their part in the dyspepsia which is a byword among foreigners as the national malady, and though much lessened, is still most formidable. Over-eating, too, is largely responsible for the prevalent Bright's disease and degeneration of the arteries. Sweetmeats and the mixtures of the drug-stores, ice-cream soda and artificial flavors, are other potent causes; especially among girls is the eating of candies between meals. The business man's five-minute meal at the lunch counter saves his business time often to the permanent ruin of his health. The question of alcoholic drinks is usually left to the forum of morals or politics; but it has a serious bearing on health, though not nearly so much as one or two generations ago. The introduction of light beers has not only lessened drunkenness, but organic diseases of the liver, stomach, heart, and arteries.

Few influences on general health have been greater or more beneficial than the enormous multiplication of the means of cheap enjoyable outdoor exercise in America within the past generation. Owing to the climate, it is much harder to keep up habits of steady exercise here than in Europe, and unless there can be sociability with it, most people will not put themselves under the stress. We have not been a people addicted to sport or play, and formerly there were not sufficient means provided for us. Now tennis and golf, and the bicycle and their kind, are improving the constitutions, especially the nervous condition, of vast numbers. Of course there must be judgment in these matters, and probably some elderly people injure themselves by indulging in severe athletic sport only fit for young people with sounder tissues.

Massage need only be mentioned; its aim is primarily to remove obstructions to circulation. The normal blood should be sufficient to establish normal bacterial and other conditions, and massage gives it the freest play. The essence of bathing, called when practised scientifically "hydrotherapy," is the same, save that its special function is to free the obstructed perspiratory system.

To these might be added a fourth, which in some sense is the most natural of all; for it has been practised in ages more remote by many thousands of years than the suspicion of either of the others, and by savages almost at the bottom of the human scale; that is, some form of suggestion or hypnosis. The main difficulty of this sort of treatment is that so little has been done to make it utilizable in practice, or to provide any certain means of assuring a definite result. Another is, that as with all the forms of mental science, its vagueness, its mystery, the impossibility of regulating its manifestations, surround it with so hopeless an atmosphere of fraud and of that open-mouthed credulity which irresistibly invites fraud. Yet after all, the psychical method has always played an important though largely unrecognized part

in therapeutics. It is from faith, which buoys up the spirits, sets the blood flowing more freely and the nerves playing their parts without disturbance, that a large part of all cures arises. Despondency, or lack of faith, will often sink the stoutest constitution almost to death's door; faith will enable a bread pill or a spoonful of clear water to do almost miracles of healing, when the best medicines have been given over in despair. The basis of the entire profession of medicine is faith in the doctor and his drugs and his methods. This is no new discovery: it was said by Galen that "he works the most cures in whom most have faith"; and the doctor-chemist-charlatan Paracelsus, who died of taking a universal panacea too poisonous even for his confidence, told his patients to have full faith and a strong imagination, and they would see the effects of it.

The subject of hypnotism, originally called mesmerism from its 18th century describer and practiser, can only be touched upon. Different practitioners have had such varying results from its use as to suggest that here too the personal equation is very important. Braid of Manchester, England, who first made a scientific study and attempt at utilizing it, was not successful; while an English surgeon in India, Esdaile, was highly successful, performing 268 operations on patients with all the effect of anæsthetics, not then introduced. Its possibilities have been greatly exaggerated, not so much by the claims of the persons using it (except impostors) as by the eager credulity of the public. It seems not so much to create a new condition of sensitiveness to suggestion, as to increase what normally exists. In organic disease it is practically useless. Its great service has been found to be in various affections which may all be classed as of the nervous system: hysteria, spasmodic functional complaints, children's vicious habits, and the victims of the drug and alcohol habits; occasionally in childbirth and surgery, but it is precarious and not free from serious dangers. It should no more be practised without witnesses present than dentists give nitrous oxide; and the law should restrict its practice to special licensees or physicians of a certain grade.

WILLIAM OSLER,

Formerly of Johns Hopkins Medical School.

Medicine, American Academy of. See AMERICAN ACADEMY OF MEDICINE.

Medicine Dance, a common practice among the American Indians; dances being conducted by the medicine men of the tribe for various purposes, and in preparation for different events, like warfare, the hunt, etc. Both in the dance before a battle and in the conflict itself the medicine chief is the one man most worthy of consideration. If war takes place he courts the thick of the fight if for no other reason than to show his immunity from danger. The funeral dance of the Yaqui tribe is a representative example of the medicine dance; the chief medicine man arranging the ceremony, which ensures the safe passage of the dead to the spirit world. The dancers to the number of half a hundred appear in the centre of the assembled tribal gathering, naked except for a cloth about the loins. Their bodies are painted in imitation of skeletons. Over their heads they wear masks fringed with long horse-hair, dyed in many hues,

eyelashes and eyebrows hang over the rudely designed faces, and beards reach nearly to the waist. On their legs they fasten strings of rattles cut from rattlesnakes, and the sound of these is most greswome to the spectators. Each dancer carries two knives, one in each hand, with which he gesticulates violently in imitation of the act of slaying imaginary enemies. Every man dances after his own ideas, each seeming to outdo the other in the violence of the motion. Music for the dance is furnished by tom-toms. After the dance a great feast follows, continuing until midnight.

Medicine, Eclectic, embodies the principles and practice of the only established American school of medicine. The term Eclectic was not the most fortunate, for at no time has it adequately defined the school's position. When chosen, the term was very popular and was borne by several educational systems and books, and was moreover, well known to the laity. The name American School of Medicine, as proposed by Dr. A. H. Baldrige, one of its pioneers, would have been more expressive, would have avoided misunderstandings and would have saved the school much criticism regarding its position among the existing systems of medicine. Eclecticism is the direct successor of the American Reformed System of Medicine originated by Dr. Wooster Beach of New York city in 1825. It should not be confounded with Thomsonism (Thomsonianism), or the doctrines of the steam and herb doctors, promulgated and practised in the early part of the 19th century by Samuel Thomson of New Hampshire, the peculiar theories of which the Eclectic school never adopted; the majority of the followers of Thomson being among their most bitter antagonists. In later years, however, many of the Thomsons joined the Eclectic school and creditably assisted in upbuilding it. The most successful organizer of the Eclectic school was Dr. Thomas Vaughan Morrow of Kentucky. The investigations in medical botany and materia medica by Schoepf, Benjamin Smith Barton, W. C. P. Barton, Constantine Rafinesque, William Tully and others gave an impetus to the movement which resulted in the establishment of the new school. The Reformed School of Medicine, by which name, what was later denominated Eclecticism was first known, was organized in opposition to the drastic practice of the dominant school of medicine,—bleeding, blistering, and the abuse of the salts of mercury and antimony,—against which Eclectics, as well as the followers of Thomson and Hahnemann, protested. Instead of these barbarous remedies the reformer sought to substitute milder measures and to employ vegetable medicines whenever possible. Yet, in the light of the present the substituted practice of the early reformers would be regarded as but little less barbaric than that which they sought to supplant. The basis of Eclectic philosophy was the sustenance of the vital forces, the avoidance of depleting remedies, and the selection, as with the ancient Eclectics, of the best of remedies and means from all sources, even despising not the primitive medicines of the untutored American Indians. They did not rest contented, however, with merely "selecting the best"; they endeavored to improve on such selections. To the reformer the practice of the dominant school was cruel

MEDICINE

and inhuman, the remedies barbaric. Out of the common stock of remedies he chose those best suited to his purpose in what he believed to be a more humane practice. He looked forward to certain ideals and objects not in accord with the views and practice of the dominant school. For his presumption in thus opposing the authorities in medicine and by inaugurating unwelcome innovations he was branded an irregular; was ostracised by the self styled regular physicians. An outcast, he was thus forced to organize a school in accord with his theories and practice.

There are three epochs in the history of Eclectic medicine,—the period of reformed medicine, from 1825 to 1845; the formative period, from 1845 to 1869, which was largely concerned in organization, and study of plant remedies; and the period of specific medication, from 1869 to the present, in which the best work of the school has been accomplished, and during which the theory of specific medication was promulgated and has been most largely practiced.

The educational history of Eclecticism dates from 1825, when Dr. Beach privately instructed students at his clinic in New York, where, in 1827, he established an Infirmary, which in 1829, he expanded into the Reformed Medical Academy. In 1830 it assumed the more dignified title of the Reformed Medical College of the City of New York. It was well equipped and continued in operation until about 1838. Text books of a high order were prepared by Dr. Beach. A national society was formed and from this body an expansion movement was begun by the selection, in 1830, of Dr. John J. Steele as an agent to proceed westward and explore the towns on the Ohio River with a view to selecting an eligible site for a branch of the New York College. A circular of the society having reached Worthington, Ohio, Col. James Kilbourne, president of Worthington College, invited the promoters to establish their school in that town. Dr. Steele accepted and Drs. Thomas Vaughan Morrow and Ichabod Gibson Jones were sent to perfect the organization. The Reformed Medical Department of Worthington College, as this school was called, entered upon a successful career in 1830, with Dr. Morrow as the leading spirit, but lack of proper facilities, the machinations of enemies, internal dissensions, and the financial crisis of 1837 caused it to be suspended in 1842. Dr. Morrow next removed to Cincinnati, Ohio, and assisted by Drs. Lorenzo Elbridge Jones and Alexander Holmes Baldrige, at once organized the Reformed Medical School of Cincinnati. In 1845 this college was chartered by the State of Ohio as the Eclectic Medical Institute. From this time the term *Eclectic* has been employed to designate the system and its physicians.

The formative period of Eclecticism began with the chartering of the Eclectic Medical Institute in 1845 and ended with the introduction of specific medication in 1869. During this period large classes attended the Institute. 'The Western Medical Reformer,' begun in Worthington in 1836 and suspended in 1838, was now revived and published as the 'Eclectic Medical Journal.' Barring a brief half year suspension this periodical has continued to be published to the present time. In this period, Dr. John King, justly styled the father of modern materia medica, began the publication of his numerous text

books, among which the 'American Dispensatory' gave the school an enduring and monumental work on materia medica. The pharmacy of the school advanced from crude drugs in powder, infusion, and decoction past the resinoid and alkaloid distraction to improved galenicals. In this connection be it recorded that Professor King discovered and introduced the resins of podophyllum and macrotys, which together with the alkaloids of hydrastis and sanguinaria, were afterwards prepared by Dr. William Stanley Merrell. These valuable agents together with the oleoresins of iris and capsicum attracted the attention of pharmacists. A host of indefinite compounds was added by others and the market was flooded with what purported to be Eclectic resinoids or concentrations. This heterogeneous class of pharmacals was denounced by Professor King and others who had sought to introduce only elegant and definite compounds. This much abused class of resinoids, served, however, a temporarily useful purpose in the evolution of a more perfect materia medica. Of these preparations, only those made after the methods of Dr. King, and the alkaloids of hydrastis and sanguinaria have survived and singularly are now mostly employed by practitioners of the dominant school. During this period Eclectic colleges were established at Rochester and Syracuse, Louisville, Philadelphia, New York, and Cincinnati. The majority of these were short lived and some of them had a strong leaning toward the system of botanic medicine now represented by the physio-medicalist. The Eclectic Medical College of Pennsylvania for many years in good repute, finally drifted away and during the later years, (since 1871) was neither recognized by Eclecticism nor others. In 1856, a portion of the faculty of the Eclectic Medical Institute formed a rival college in Cincinnati which had a large following. This school was absorbed by the Institute in 1859. The Civil War seriously threatened the educational progress of the cause and the withdrawal of a large quota of Southern students caused a marked shrinkage in the attendance at the Northern schools. Times were hard and the outlook gloomy. Dr. John Milton Scudder, a graduate of the Eclectic Medical Institute in 1856, now became the head of that institution. By strict business management he inaugurated a period of renaissance and Eclecticism soon became a recognized force in medicine in America. Specific medication, introduced by Dr. John M. Scudder in 1869, though at first vigorously opposed, is at present the basis of practice of fully three-fourths of the Eclectic physicians and is the leading therapeutic doctrine taught in all the Eclectic colleges. In fact modern Eclecticism is the practice of specific medication. Its theory is as follows:—Disease is a wrong or impairment of life. It is manifested clinically by certain well defined symptoms. The totality of symptoms express a condition, to which, in the usual nosological classification, a special name is given. This disease name is of value only in the study of the natural history of diseases, for statistical data, for the purpose of recognizing contagious and infectious diseases, and for establishing a prognosis, certain necessarily fatal diseases allowing only of palliative treatment. The specific medicationist, like practitioners of other schools, pursues such a method of nosological

MEDICINE

diagnosis for the purposes named, but not as a guide to treatment, in which to him it is of little or no value. For therapeutic purposes he reverses this process and studies his case by analysis, not by synthesis, to discover if possible, the varying conditions which make up the disease, as evidenced by specific and well defined symptoms revealing disease expressions. Remedies have a certain force, and are definite in action. Like effects follow like causes. Hence, having found, by repeated experimentation, the opposing action of a drug in a certain condition of disease, as expressed by certain specific symptoms, objective or subjective, the same remedy will always relieve or cure like abnormal conditions. The believer in specific medication holds that there is a fixed relationship between drug force and disease expression.

The Eclectic has no specifics for diseases but specific remedies for specific conditions of such diseases. Specific diagnosis implies diagnosis to discover the condition curable by a certain remedy, as established by previous experimentation, and specific medication means the application of the known remedy for the pathological condition so found. Specific diagnosis is therapeutic, not nosological diagnosis. In practice the specific medicationist is guided in the selection of his remedy by "specific indications," as illustrated by the few following examples: The strong, excited, bounding pulse indicates *veratrum viride*; sharp, cutting or lancinating pain in serous tissues, *bryonia*; the full, oppressed pulse with a sensation of præcordial fullness and dyspnoea, *lobelia*; marked periodicity, with moist tongue, open pulse, and freedom from nervous excitement, *quinine*; cadaverous odor of the secretions, *potassium chlorate*, etc.

The modern Eclectic recognizes no law of cure, and does not accept a remedy as a specific until the extended successful employment of it in some particular condition has given it the right to be so called. Empiricism and experimentation are the foundations of knowledge concerning each remedy denominated a specific medicine. The havoc wrought Eclectic pharmacy at the close of the formative period had now to be remedied. The school had been nearly shipwrecked on the shoals of commercial selfishness, as seen in the instance of the resinoids. Calamities often bring about future good, so in this instance the commercial mistakes of a few gave a renewed impetus to better the conditions of Eclectic pharmacy. Uncertain preparations were supplanted by definite medicines. As a result the school has now a materia medica and system of therapeutics much sought by the descendants of those who endeavored to block the efforts of the pioneer Eclectic, in his zealous contention for pure and representative medicines. Dr. Scudder, supported by Dr. King and others, advocated office pharmacy as a step toward a better knowledge of drugs and to secure definite remedies. Special attention was given green and freshly dried products. Formulas were published for the preparation of specific medicines. Finally, in order to secure the integrity of these medicines and protect them from conscienceless manufacturers, Dr. Scudder copyrighted the labels. These bore the title "Specific Medicines" and gave the specific indications for their use. The manufacture of medicines bearing these labels was entrusted to competent pharmacists

and from that time the school has been free from objectionable pharmacy. Dr. Scudder advocated the use of specific medicines in the study of the relationship of medicine to disease expressions. The Eclectic of the formative period selected from other schools, but endeavored to improve. He substituted milder for harsher methods; he opposed the use of the lancet and blister, and the abuse of mercury and antimony salts. The modern American Eclectic advocates the use of kindly curative remedies, and the avoidance of depressing or depletive medication. He has been the pioneer in the study of the indigenous *materia medica*, with special reference to specific indications and specific uses of medicines employed. He contends for the best possible pharmacy so that the minimum amount of medicine may accomplish maximum results. Harmful medication as exemplified in excessive drugging he has consistently opposed, heroic over-drugging having been one of the most potent causes leading to the necessity for the establishment of an Eclectic school. He advocates liberality of thought, the highest medical education, the cultivation of professional dignity, and the ethics that govern gentlemen.

The position of the Eclectic school of medicine is now well established, and the attitude of malice and persecution formerly shown it by rival schools is fast becoming a memory. The school numbers upwards of 8,000 Eclectic physicians. For a period of about ten years this numerical relation has remained nearly stationary, but because of better facilities for teaching, enlarged literature, and harmony in the ranks of the school it has never occupied so favorable a position nor had a better outlook for the future than it has to-day. Never before in its history has it been so free from internecine bickerings, attacks by rival schools, and unpleasant entanglements and alliances. It challenges all ages in the wealth and completeness of its *materia medica*. Recognizing the merit of the work accomplished the regular profession in many localities now invites Eclectics to join its associations providing they drop their distinctive title. This the Eclectic is unwilling to do, believing that the school has earned the right to be regarded and recognized as a distinct sect in medicine. Its work in the special fields of *materia medica* and specific diagnosis and specific medication entitle it to this right. The Eclectic school has a strong national organization and numerous State and local societies. A national reform association was founded in 1829, and a second at Worthington, Ohio, in 1836. In 1848 the first National Eclectic Medical Association was organized in Cincinnati, Ohio, with Dr. T. V. Morrow as president, and it held annual sessions until 1858. The present National Eclectic Medical Association was organized at Chicago, Ill., in 1870, with Dr. John W. Johnson, of Connecticut, as president. It holds annual sessions, meeting in various cities throughout the United States. Eclectic practitioners now hold positions as examiners in the more important life insurance companies, and are not now debarred from the army medical service as in the earlier days of medical ostracism. No discrimination is now made against them as surgeons for the great railway systems. These recognitions have been earned in the face of vigorous medical op-

MEDICINE HAT — MEDINA

position, by the consistent and honorable course pursued by the Eclectic school as a whole. Eight colleges recognized by the National Society are now actively teaching Eclectic medicine; two recently instituted are awaiting the required period of probation. These may be named as follows: Eclectic Medical Institute of Cincinnati, Ohio, the parent school of medical Eclecticism, chartered in 1845. Eclectic Medical College of the City of New York, chartered in 1865. Bennett College of Eclectic Medicine and Surgery, Chicago, Ill., organized in 1868. The American Medical College, of Saint Louis, Mo., incorporated in 1873. The California Medical College, of San Francisco, Cal., organized at Oakland in 1879. Eclectic Medical University of Kansas City, Mo., organized in 1897. Lincoln Medical College, Lincoln, Nebraska, reorganized in 1889. Eclectic Medical College of Indiana, Indianapolis, Ind., organized in 1900. American College of Medicine and Surgery, Chicago, Ill., organized in 1901. The Georgia College of Eclectic Medicine and Surgery, at Atlanta, Ga., was organized in 1866, but did not become actively Eclectic until 1886, when it was recognized by the National Association. These colleges are well organized and ably conducted. Organized co-operation is maintained between those recognized by the National Eclectic Association by means of a body known as the National Confederation of Eclectic Medical Colleges, organized under the direction of, and from members of the presiding association, in 1894, and composed of two delegates from each college. The object of this organization is to promote the mutual interest of the recognized colleges, to establish uniform minimum requirements and curricula, and to further the cause of higher medical education.

HARVEY WICKES FELTER, M.D.,

Prof. of Anatomy and Chemistry, Eclectic Medical Institute, Cincinnati, O.

Medicine Hat, Canada, a town of Assiniboia, Northwest Territories, on the Canadian Pacific railway, 275 miles west of Regina, 175 miles southeast of Calgary; the Crow's Nest Pass branch connects it directly with Lethbridge and southern Alberta. The town is situated in the valley of the south branch of the Saskatchewan River; has a complete sewer system, waterworks, natural gas, fine business blocks, and beautiful residences. Lignite and petroleum are found in large quantities in the vicinity. It is the market town for a vast ranching district. Pop. (1901) 1,975; (1904 est.) 2,500.

Medicine Man, among the American Indians, South Sea Island tribes and other savages, a man supposed to possess mysterious healing powers. Among most savages the medicine man occupies much the same position as that held in civilized communities by two of the learned professions — medical and clerical. The medicine man is both priest and physician, and is at once the repository of all that a tribe knows, fears, and believes. In very low stages of human development, however, he is at best only a magician, dealing in terrors, possessed of occult powers, but laying claim to no special medical knowledge. Thus, among the aborigines of North Queensland, the tribal doctors do not attend on the sick — an invalid being cared for by wife or mother. They are not

ostentatious, a medicine man being distinguished by no insignia save a small bag in which his talismans, death charms, and other "credentials" are carried.

Among the North American Indians medicine men are treated with great respect, and form a secret society with exclusive privileges and "exercise a terrible influence in degrading the people." It is curious to find that, as in Australia, the Indian medicine men are chiefly concerned to do positive harm. In co-operation with good and bad spirits, they bring about the deaths of men or dogs at a distance. Among the Ojibways they are a kind of brokers in vengeance, and a coward or a hypocrite who wishes to be covertly avenged upon an enemy will bribe his tribal medicine man to employ the medical attendant of his victim. Then, if the victim dies, the instigators remain unsuspected, and the actual perpetrator of the crime probably goes scot free. Indian medicine men affect to suck out poison from a patient's body, or they cough up an arrow point or small, sharp piece of stone or bone which they suppose has been transferred from him to them by the evil spirit of another sorcerer. The medicine men of the Eskimos are even more extravagant in their pretensions. They profess themselves able to change into wood, stone, or animal, or even to walk on the water, or to fly, but they make a condition, which is that "no one must see them." An Eskimo medicine man rubs the seat of his patient's disease, blows on the part, and then withdraws his hand, "slowly and as if with difficulty, in order to show that he is hauling out a very heavy weight of pain." "At the same time he looks upward, rolls his eyes, and groans." Then he throws the disease violently away, and breathing more freely, demands immediate payment of his fee.

Medicine, Preventive. See PREVENTIVE MEDICINE.

Medill, mē-dil', Joseph, American journalist: b. New Brunswick, Canada, 6 April 1823; d. San Antonio, Tex., 16 March 1899. Having early removed to Massillon, Stark County, Ohio, he was admitted to the bar in 1846, practised at New Philadelphia, and in 1849-51 published at Coshocton the 'Republican,' a Free-Soil paper. In 1852 he established at Cleveland the 'Forest City,' a Whig organ, which in 1853 was united with the 'Free Democrat,' and called the *Leader*. In 1855 he sold his interest in the *Leader*, removed to Chicago, with two partners purchased the *Tribune*, advocated radical anti-slavery measures, and supported Lincoln in 1860. He was a member of the Illinois constitutional convention of 1870; United States civil service commissioner in 1871, and in that year was elected mayor of Chicago. In 1874 became editor-in-chief of the Chicago *Tribune*.

Medina, Jose Maria, hō-sā' mā-rē'ā mā-dē'nā, Central American politician: b. Honduras about 1815; d. Santa Rosa 8 Feb. 1878. He was president of Honduras in 1862-3 and was re-elected in 1864-6 and in 1870. The war with Salvador in 1871 disturbed his hitherto successful administration and at the next election he was defeated by the Liberal party who elected their candidate Arias. Defeated again by Leiva in 1874 Medina raised an unsuccessful revolt in 1875-6 and in 1877 a second revolt was punished with death by court-martial.

MEDINA — MEDITERRANEAN SEA

Medina, *mē-dē'na*, Arabia, the native *Medinah-al-Nabi* or City of the Prophet, 248 miles northwest of Mecca, and about 105 miles northeast of Yembu on the Red Sea. It is celebrated for containing the tomb of Mohammed whence it ranks second to Mecca as a pilgrimage resort of Islam. It is situated in the most fertile spot of all Hejaz, with an immense plain extending south from it; in every other direction the view is bounded by hills or mountains. The town forms an oval, surrounded by a strong stone wall, flanked with towers, while on a rock, at its northwest side, stands the castle. Of its four gates, the east Bab-el-Misri, or Egyptian Gate, is remarkable for its beauty. Medina has no large buildings except the great mosque, two smaller ones, a college, and public baths. The houses are of stone, two stories high. Beyond the walls of the city, west and south, are suburbs consisting of low houses, yards, gardens, and plantations. These suburbs have also their walls and gates. The Mosque of the Prophet stands at the east side of the city, and resembles that at Mecca on a smaller scale. The tomb of the Prophet is enclosed with a screen of iron filigree, at the south side of which the pilgrim goes through his devotions, for all of which he pays, but is consoled with the assurance that one prayer here is as good as a thousand elsewhere. It is estimated that one third of the Mecca pilgrims go on to Medina, the pilgrimage to which may be performed at any time of the year. The inhabitants of Medina are mostly strangers who have settled and become naturalized in feelings, manners, and language. The population of Medina is supposed to be from 16,000 to 20,000, of whom 12,000 are within the walls. Since 1814 Medina has been the capital of the north pashalic of Arabia.

Medina, *mē-dī'na*, N. Y., village, in Orleans County; on Oak Orchard Creek, and on the Erie Canal, and on the New York Central & Hudson River railroad; about 35 miles northeast of Buffalo and 12 miles from Lake Ontario. The first settlement was made about 1830. In 1832 it was incorporated as a village. It is in a fertile agricultural region in which the chief products are grapes, apples, strawberries, and other fruits, and dairy products. In the vicinity are valuable sandstone quarries from which is obtained excellent building stone. The water-power is excellent and has been increased by a storage dam. Electricity is used as a power in manufacturing as well as for light. The chief manufactures are pumps, iron, foundry products, shirts, shoes, vinegar, flour, and furniture. It has a large trade in fruit and sandstone. The Medina Falls are visited annually by a number of tourists. The government is vested in a president and board of trustees. Pop. (1900) 4,716.

Medina-Sidonia, *mā - dē'nā sē - dō'nē - ā*, Spain, a city in the province of Cadiz; 23 miles by rail southeast of Cadiz, built in the form of an amphitheatre on a broad eminence, in the middle of an extensive plain, noted for its agricultural products and cattle rearing, which constitute the chief occupations of the population. A fine Gothic church, a town hall, and the ancestral palace of the famous dukes of Medina-Sidonia are the principal buildings. Pop. (1901) 12,397.

Medina (*mē-dī'na*) **Series**, in geology, a term introduced by the New York Geological Survey for a subdivision of the Upper Silurian series, apparently the base of that system. It is named from Medina, New York; occurs throughout the Atlantic States; and includes shales, conglomerates and sandstones. For the Medina sandstone see LEVANT.

Mediterranean (*med'i-tē-rā'ne-an*) **Sea**, the great inland sea between the continents of Europe, Africa, and Asia, the remnant—according to Prof. Suess—"of a great ocean which at an early geological epoch, before the formation of the Atlantic, encircled half the globe along a line of latitude." From its eastern extremity in Syria to the Strait of Gibraltar it is about 2,200 miles long; its maximum width from Venice to the Bay of Sidra is 1,200 miles. The shores of Europe are on the north and northwest, those of Africa on the south, and those of Asia on the east. The Mediterranean is connected with the Atlantic by the Strait of Gibraltar, and on the northeast with the Black Sea through the Dardanelles, Sea of Marmora, and the Bosphorus, which form a continuous waterway. It is irregular in shape, and by the projection of the south part of Italy, and of Cape Bon in Africa, and the interposition of the island of Sicily, is divided, near its centre, into two distinct portions, an east and a west. In addition to these, the other important subdivisions are the Tyrrhenian or Tuscan Sea, between the west coast of Italy and the islands of Sardinia and Corsica; the Adriatic Sea or Gulf of Venice, between the east coast of Italy and the west coast of Turkey in Europe and Dalmatia; the Ionian Sea, between the west coasts of Turkey in Europe and Greece, and the south part of Italy and the island of Sicily; the Ægean Sea or Archipelago, between Turkey in Europe and Greece on the west and Turkey in Asia on the east; and the Levant, which is usually understood to include the whole sea east of the island of Crete. The largest gulfs are, on the shores of Europe, those of Lion or Lyons, Genoa, Tarento, Lepanto, Koron, Kolokythia, and Salonica; on the shores of Asia, Adrymiti, Smyrna, Adalia, and Skanderoon; and on the shores of Africa, Sidra and Cabes. The largest and most important islands are Sicily, interposed, as already mentioned, between the two great divisions of the sea, Sardinia, Corsica, and the Balearic Isles, in the west division; and Cyprus, Rhodes, Crete, the Ionian Isles, and Malta, in the east division. The principal rivers which discharge themselves into the Mediterranean are the Ebro, Rhone, Po, and Nile; but its communication with the Black Sea entitles it to claim it as part of its basin, and, consequently, also the great rivers Don, Dnieper, Dniester, and Danube. Between Cape Bon and the Sicilian coast, where the sea is shallowest, the depth varies from 30 to 250 fathoms; but in almost all other places, particularly at a distance from the shores and islands, the depth is very much greater, the maximum depth in the eastern division being 2,150 fathoms, in the western division, 2,040 fathoms. Owing to the very narrow channel which connects the Mediterranean with the main ocean, there is very little tide; though in some places, as in the Ionian Sea, the Adriatic, on parts of the African coast, etc., a rise of more than 6 feet sometimes occurs. The prevailing

MEDUSA LIKE ANIMALS

MEDITERRANEAN SUBREGION — MEEHAN

winds are the southeast and southwest in spring, and the northeast and northwest during the rest of the year. They often rise suddenly and with great violence. The most remarkable are the historic Euroclydon or Levanter, mentioned in Acts xxvii. 14, a northeast wind of dangerous whirlwind characteristics; the Bora in the Adriatic; the Etesian and Tramontana in the Ægean; and the burning Sirocco from the African desert. The Mediterranean abounds with fish, and also furnishes the finest coral and sponge. The evidences of volcanic action along its shores are present in the active volcanoes of Vesuvius, Etna, and Stromboli (q.v.). Consult Playfair, 'The Mediterranean, Physical and Historical' (1890).

Mediterranean Subregion, a zoogeographical district of the Nearctic Region, embracing the basin of the Mediterranean and the plains of Syria. Faunistically this region is allied to Europe rather than to Africa or Asia, from which it is separated by deserts. It includes many sub-tropical forms, rarely or never seen north of the Alps or south of the Atlas Mountains. See ZOOGEOGRAPHY.

Medjidie, mē-jēd'ē, a Turkish order of knighthood, instituted by the Sultan in 1852. It has been conferred on numerous foreign officers, soldiers, and seamen, who have taken part in wars on behalf of Turkey. The name is also given to a modern Turkish silver coin, value about 85 cents.

Med'lar, a small tree or shrub (*Mespilus germanica*) of the rose family and a native of southern Europe where, in the wild state it has thorns, but in cultivation it is thornless. It differs from various near relatives, such as apple and pear, in bearing solitary, large, white, terminal flowers upon leafy growths of the current season, and, like the quince, in having no detachable peduncle to the fruit in which the receptacles do not completely overgrow the ovaries. It is widely grown in Europe but much less in America. In Central New York it is fully hardy and produces well with no special care. The top-shaped fruit, which is about the size of a small pear, should be allowed to hang until after a frost, which mellows its austerity and assists the process of "bletting," as ripening in cool dry rooms is called. When in a state of incipient decay the softened fruits are eaten by those who enjoy tart flavors, or are made into preserves.

Medoc, mā-dōk, a wine which derives its name from a district of France, in the ancient province of Gascony. It is mostly covered with vines, which are cultivated with great care, and the wines produced from which have a high reputation. See WINES.

Medul'la, in botany, the pith of a plant-stem. See PITH.

Medul'la Oblonga'ta, the brain-stem, or that part of the nervous system that lies between the *pons*, or *pons Varolii*, at the upper end, and the spinal cord proper, with which it is continuous, at its lower end. It is a very old part of the nervous system, judged from the standpoint of evolution, and in it are located the important centres of most of the cranial nerves, including the centres that govern the nerves of the heart and of respiration. It is a triangular cone-like portion of the nerve-axis, about an inch in

length and one half to three quarters of an inch thick, being tubular below and flattened above. Below, it closely resembles the cervical cord in its internal construction, but above great changes take place to accommodate important new structures. One of the most conspicuous features of the medulla consists in a triangular enlargement of the central canal of the cerebro-spinal axis, constituting what is known as the fourth ventricle. The lower seven cranial nerves have their apparent origin in the medulla, and the first spinal nerve also originates in the medulla proper. The internal anatomy of the medulla is complicated. At the lower end the chief motor tracts, the pyramidal tracts that come from the motor area (q.v.) in the brain cross one another to pass down on opposite sides of the spinal cord. It is because of this decussation that a hemorrhage of the brain of the right side causes a paralysis of the muscles of the left side of the body, and *vice versa*. Just above the decussation of the pyramids the end-stations (nuclei) of the two chief sensory tracts of the body are located. It is into these nuclei—the gracilis and the cuneatus—that all of the sense-impressions from the body below the head are collected, to be passed to higher cerebral centres through the lemniscus or sensory fillet. The chief gray masses in this part of the brain are the nuclei of the cranial nerves referred to, and of the olives, two structures of undetermined function. The best description of the oblongata at present is that of the model of the medulla and pons by Dr. Florence Sabin, which is figured in Barker's 'Nervous System.' Consult also: Buck, 'Reference Handbook of the Medical Sciences,' article "Brain," and Johns Hopkins Hospital Reports, Welch Memorial Volume. See BRAIN.

Medusa, mē-doo'sā. See GORGO.

Medusa, a disk-bearing jellyfish (q.v.).

Med'way, Englad, a river which rises in the county of Sussex and flows northeast in a winding course across Kent, past Tunbridge and Maidstone, to Rochester and Chatham. Below Chatham it spreads out into a broad tidal estuary, in which are several islets, and joins the Thames at Sheerness. It is 70 miles long and is navigable to Penshurst, 20 miles above Chatham.

Meehan, mē'an, Thomas, American scientist: b. Potter's Bar, near London, England, 21 March 1826; d. Philadelphia 19 Nov. 1901. From his father, a gardener, he learned facts of natural history when a child; at 8 made and recorded an original discovery in herpetology; taught himself from books read at night after daily tasks; at 12 began to publish scientific papers; soon after produced the first hybrid fuchsia; and was nominated to membership in the Royal Wernerian Society. For two years he held a position at Kew Gardens. In 1848 he came to America and took charge of Bartram's Gardens in Philadelphia. In 1854 he established the Germantown Nurseries, which he conducted until the end of his life. For 30 years (1859-89) he edited the 'Gardeners' Monthly,' and contributed papers to many other periodicals and to scientific societies. For 23 years he was senior vice-president of the Philadelphia Academy of Natural Sciences, in whose proceedings were published his important 'Contributions to

the Life History of Plants.' In 1875 he was elected a fellow of the American Academy for the Advancement of Science, before which, among other noteworthy papers, he read 'A Contribution to the Doctrine of Evolution and the Theory of Natural Selection,' which showed him as a co-worker with Darwin and other evolutionary scientists, in whose field he also was a discoverer. From the creation of the office until his death he served as State botanist of Pennsylvania, at one time was a member of the board of visitors of Harvard, and was one of the American editors of the 'Encyclopædia Britannica.' His travels and researches extended throughout the country, including Alaska. In 1878 he began the publication of 'Native Flowers and Ferns of the United States,' an illustrated serial covering a wide field of floral distribution, the main features of which he continued in 'Meehan's Monthly,' founded in 1891. Many learned societies abroad enrolled him, and he held intimate relations with nearly all the leading scientists of his time. Among his closest friends was the Comte de Paris, a devotee of plant-study. Meehan was the third American to receive the Veitch medal, awarded to him for "distinguished services in botany and horticulture." Apart from scientific work he devoted himself to public labors; was a member of the Philadelphia common councils from 1882 until his death; during the same period served on the local school board; in both capacities introduced many reforms; and chiefly through his efforts nearly 30 small parks were added to the city. A work of permanent value is his 'American Hand-book of Ornamental Trees' (1853).

Meek, mēk, Alexander Beaufort, American jurist: b. Columbia, S. C., 17 July 1814; d. Columbus, Miss., 30 Nov. 1865. He was graduated from the University of Alabama in 1833 and admitted to the bar two years after. He served in the Seminole War 1836; was attorney-general of Alabama 1836; judge of Tuscaloosa County 1842-4; and member of the legislature in 1853. While there he established the free-school system of Alabama. In addition to a legal digest (1842) he wrote: 'The Red Eagle' (1855); 'Songs and Poems of the South' (1857); 'Romantic Passages in South-western History' (1857); etc. His best known poem is 'The Charge at Balaklava.'

Meek, Fielding Bradford, American paleontologist: b. Madison, Ind., 10 Dec. 1817; d. Washington, D. C., 28 Dec. 1876. His educational advantages were limited, but his interest in natural history made study imperative to him, and in 1848 he became assistant to David D. Owen in a geological survey of Iowa, Minnesota, and Wisconsin. He assisted James Hall at Albany in 1852-8, spending several summers in a geological survey of Missouri and Nebraska, and in 1858 went to Washington, where he devoted the remainder of his life to paleontologic investigations under the government. He was elected in 1870 to the National Academy of Sciences, and was a member of other scientific organizations. Among his writings are: 'Check List of the Invertebrate Fossils of North America' (1864); 'Report on Invertebrate Cretaceous and Tertiary Fossils' (1876); etc. For a complete list of his works, see bibliography published by the Smithsonian Institution.

Meer'kat. See SURICATE.

Meekins, mē'kinz, Lynn Roby, American journalist: b. Salem, Md., 14 Nov. 1862. He was graduated from Western Maryland College, Westminster, Md., in 1882, and devoted himself to journalism. He was literary editor of the Baltimore *American* 1882-9, when he became managing editor of the Philadelphia 'Saturday Evening Post,' and since 1903 has been editor of the Baltimore *Herald*. He has published: 'The Robb's Island Wreck' (1894); 'Adam Rush' (1902); etc.

Meeks, Eugene, American painter: b. New York 1843. He studied under Wust, at The Hague, and under Van Lerius at Antwerp. In 1883 he received the title of professor from the Academy of Florence, in which city he had made his permanent residence. His Venetian pictures include 'Gondola Party' and 'Fishing Boats,' and he has successfully handled a motif taken from Dickens, in his 'Little Nell and Her Grandfather' (1876).

Meerschau, mēr'shām or -shum, a name given to one of the silicates of magnesium; it is a mineral of a whitish or creamy color, and received its name from its appearance and the position in which it is sometimes found suggesting that it was petrified foam of the sea. It is obtained from various places, but the best quality comes from Asia Minor, rich deposits of it existing about 20 miles southeast of Eskichehir, at a place called Sepetdje. Here are some 20,000 pits in a space of six miles, of which only 150 are worked, all the others being exhausted. It is said that these mines were opened 1,000 years ago, which is not incredible, as it is well known that magnesia was formerly used for many purposes, other than the fabrication of pipes; moreover, fuller's earth used to be worked on a vast scale by the ancients. The meerschau mines are worked by some 500 miners, who live in the surrounding villages. At Gheikli, in the neighborhood of Sepetdje, there are 3,000 pits, of which only 100 are worked, giving employment to 400 miners. The mineral is mined in blocks, which are taken to Eskichehir, where the blocks are cleaned, the operation consisting of scraping and cutting the blocks with a sharp instrument or knife, the meerschau being still soft and easily cut into any shape or form. Over 1,100 persons are occupied in cleaning and shaping these blocks, which, after being thoroughly cleaned, are separated into four classes, according to size and quality. These blocks being ready for sale, a bargain is struck between the pipe manufacturers and the commission agents and merchants at Eskichehir, of whom there are about a dozen. The latter then pack the blocks of these four classes with very great care into boxes of equal size, each block being wrapped in cotton to avoid any friction or shock between the pieces. The actual annual output of these mines varies from 120 to 150 tons. It is soft when dug up, but becomes hard when dry. Most of it is sent to Vienna, where it is chiefly made into tobacco-pipes, many of them highly artistic. Similar pipes are also made in Paris, London, and elsewhere.

Mees, Arthur, American musical director: b. Columbus, Ohio, 13 Feb. 1850. He was graduated from Concordia College, Fort Wayne, Ind., and studied music in Berlin. He has been assistant director, and later director, of some of the leading operas and musical associations, and

MEGACLES—MEGAPODES

has published, in addition to his annotated programmes for the New York Philharmonic Society and the Chicago Orchestra, 'Chorus and Choral Music.'

Megacles. The most illustrious Greek of this name was the head of the family of the Alcmaeonidae at Athens in the time of Solon. After twice expelling Pisistratus, who in 560 B.C. had made himself 'Tyrant' of Athens, he was himself exiled by him together with all his family.

Megalensia or Megalesia, an annual festival at Rome (4-10 April) in connection with the foreign cult of Cybele, the *Magna Mater* or Great Mother of the Gods, celebrated by a procession of her eunuch-priests, by circensian and theatrical shows, and at the close a carnival.

Megalithic Monuments. See DOLMEN; MENHIR; STANDING STONES; STONE CIRCLES.

Megalopolis, mēg-a-lōp'ō-lis, or **Sinanon,** Greece, a ruined city on the ancient Helisson, in the nomarchy of Gortynia, 5 miles north of Leondari. It was founded 370 B.C. by Epaminondas, as the federal capital of Arcadia, and was frequently but unsuccessfully attacked by the Spartans. In 222 B.C. it was captured and partially destroyed by Cleomenes III. From 1890-3 the British School at Athens excavated the site and revealed the Precinct of Zeus Soter, the Agora, the Stoa of Philip and the Stoa of Myropolis on the right bank of the river, and on the left bank, the Theatre and Scanothea, the Thersileon or great assembly hall, altars, and remains of other buildings described by Pausanias. Consult Schultz and Loring, 'Excavations at Megalopolis' (1892).

Megalosaurus, mēg'ā-lō-sā'rds, a genus of huge carnivorous dinosaurs of the group *Theropoda*. Their remains occur in a fragmentary way in the European oolitic rocks. See DINOSAURIA.

Megaphone (a Greek word meaning "great sound"), an instrument devised by Thomas A. Edison for carrying the sound of the voice long distances without the aid of wires. It consists of two large funnel-shaped receivers in which the waves of sound are collected and concentrated and carried by means of flexible tubes held to the ears of the person using the instrument. In the instrument called telephone-megaphone, the mouthpiece of the telephone is connected with four transmitters which multiply the usual telephone sound of the voice by four, and it is sent by wire, so increased, into the megaphone, which sends it forth into space with sufficient intensity to carry it with perfect distinctness throughout a large church or hall. The ordinary megaphone is largely used by deaf persons.

Megapodes, a general name for the brush-turkeys or mound-birds of Australia constituting the gallinaceous family *Megapodiidae*, so named in reference to the disproportionately large size of the feet; and remarkable for their breeding habits. The family, although mainly Australian, is represented in many of the South Sea Islands and in the Philippines, replacing the pheasants, which are absent from that region. There are 7 genera and 20 or more species, mostly with restricted individual ranges, and varying in size from that of a turkey to that of a large pigeon, the sexes being always alike in plumage. The

general colors are browns and yellows with the naked wattled parts brightly colored. They have a short, strong bill; the head and neck almost naked and wattled; the wings short and round, the tail large; the legs and feet large, strong and provided with great claws. Megapodes are terrestrial birds found in hill-valleys, among thickets or along river and sea beaches. They run well, but if hard pressed will take to trees where they hop about awkwardly; their flight is heavy, but may be long sustained. Hoarse, chuckling, cackling or mewing cries express the utterances of the different species, which are often heard at night. The food consists of fallen fruit, seeds, berries, worms, snails, insects, and even small crabs. The flesh is dark-colored and not good, though palatable to the Australian aborigines.

One of the best known species is the brush-turkey or mound-turkey (*Cathetus lathamii*), also known as the wattled talegalla and the New Holland vulture, the latter name being given to it on account of its yellow, naked head and neck, covered in part with fleshy wattles. It is rather common in New South Wales, inhabiting the most thickly wooded parts. It is a large bird, about the size of a turkey, with blackish-brown plumage. It is shy, and when pursued, endeavors to escape by running through the thickest brush, or by leaping to the lowest branches of a tree, and thus avoids the dingoes or native dogs, which, however, often hunt it down on open ground. It is easy game to the sportsman, who finds it roosting under shelter of the branches of trees during the heat of the day, and although several of a flock are shot, the rest keep their place undisturbed. They are generally seen in small flocks, and make their nests together, the females heaping up, by means of their feet, mounds of several cartloads of earth and decayed leaves, which are used from year to year, new materials being added every year. The eggs are separately buried, often by several females, within the mass, where they are hatched by the heat of the fermenting mound. The parent birds partially uncover them during the day. Nearly a bushel of eggs may sometimes be found in a single heap. The male bird pays great attention to the young after they are hatched, covering them up partially in the mound at night for warmth. The flesh of the talegalla is excellent, and the eggs are also very delicate and eagerly sought after. Two other species occur in New Guinea.

South and West Australia have another familiar megapode in the mallee-hen or "native pheasant" (*Lipua ocellata*)—a large gray-brown bird with eye-like markings on the wings and back, and the naked neck and wattles blue; its mounds are comparatively small and often made individually. A bird often confounded with this in books because of similarity of name is the maleo (*Megacepalon maleo*) of North Celebes, which has the singular habit of making a general migration in the breeding season to the sea-beach, where small groups of females dig large holes in the sand just above high-water mark, and day by day bury eggs there until the quota of each is laid; these gradually hatch under the influence of the hot sand. The largest genus is *Megapodius*, whose 15 species are scattered over all the island region between Samoa, the Philippines and the Micobars, each group having a distinct species. The most widely

distributed and best known is *M. tumulus*, the common mound-bird or scrub-turkey of Northern Australia and the Papuan archipelago, which fashions mounds 10 or 11 feet high in the densest woods, continues to use them year after year, and lays pale, coffee-colored, thin-shelled eggs in straight burrows penetrating the mound. In some islands the eggs of these birds are an important food resource. The young are well fledged when they emerge from the egg and scramble out of the mound, but are attended to by their parents for some time. Consult Newton, 'Dictionary of Birds' (1896); 'Proceedings,' Zoological Society of London, 1876, 1888, etc., and works on the ornithology of Australia and Oceania.

Meg'apolen'sis, **Joannes**, Dutch Protestant missionary to the North American Indians: b. Koedyck, Holland, 1603; d. New York 24 Jan. 1670. His family name, van Mekelenburg, he Hellenized to Megapolensis. In 1642 Van Rensselaer, the first Patroon, brought him to New York from Holland, and he soon learned the Mohawk tongue and preached successfully among the Indians near Albany, several years before John Eliot's mission or any other Protestant preaching to the Indians. From 1649 until his death he was pastor of the Dutch church in New York, where he showed little tolerance to Lutherans and Independents. He advised peaceable surrender to the English in 1664. His account of the Mohawks is published in the third volume of the New York Historical Society's 'Collections' (1870).

Meg'ara. See MEGARIS.

Megar'ic School. See MEGARIS.

Megarís, mēg'a-ris, Greece, the name of an ancient state or small district bounded north by Boeotia, east by Attica, south by the Saronic Gulf and the territory of Corinth, west by the Corinthian territory and the Corinthian Gulf; area, about 143 square miles. It is a mountainous country, the only plain being that on which the capital was situated. Mount Cithæron was on the north boundary, separating it from Boeotia. The only important town was Megara, situated a mile from the sea, opposite the island of Salamis. It contained a Pelasgian citadel, called Caria, on a hill northwest of the city, with a temple to Demeter called Megaron, from which the name of the town is supposed to be derived. It had flourishing colonies at an early period, and its navy was so powerful that it was only after a long struggle with it that Athens obtained possession of Salamis. It afterwards became annexed to Attica, of which Megaris formed one of the four ancient divisions. It was successively conquered by the Dorians and the Corinthians, but afterward asserted its independence, and became wealthy and powerful. Pop. 65,00.

Megasthenes, a Greek historian, who about the year 302 B.C., as ambassador of King Seleucus Nicator at the court of the Indian king Sandracottos, gathered the material for a geographical and historical account of India that, reaching us in the form of fragments and worked over in Strabo, Diodorus, and Arrian, is our chief source of knowledge of that country in antiquity. An edition of the fragments by E. A. Schwanbeck (Bonn 1846). A translation by McCrindle, 'Ancient India as Described by Megasthenes and Arrian' (Calcutta 1877).

Megather'ium, a gigantic fossil ground-sloth, the largest known edentate, representing

the family *Megatheriidae*, and especially the species *Megatherium americanum*, whose remains are found plentifully in the Pleistocene strata of Argentina and Patagonia. These early edentates were so generalized, that, as compared with modern forms, they exhibit the head and teeth of a sloth, associated with the vertebræ, limbs and tail of the ant-eater. Some of them attain a gigantic size, at least as large as an elephant, but with shorter limbs and a bigger tail, and the latest species are the most bulky. *Megatherium*, according to Woodward, seems to have been entirely destitute of dermal armor. The only one of its allies in which bony plates have been discovered is *Myiodon*, and they are very small and not fused together. The mylodons were somewhat smaller than the megatheria, with a skull and teeth more like those of the modern sloths, and the three inner digits of the forefoot bear claws, about equal in size, instead of the huge middle-finger claw of the *Megatherium*. In both animals the hind foot lacks digit I., but II. and III. bear claws. The typical species of myiodon (*M. harlani*) was about as large and of much the same form as a rhinoceros, and inhabited the southwestern United States, while various other species lived in South America. The long-headed South American genera, *Scelidotherium* and *Megalonyx*, are other forms of the same family. Consult the palæontological writings of Leidy, Lydekker, and Woodward.

Megna, mēg'na, or **Meghna**, India, the estuarine outlet of the Ganges and Brahmaputra (qq.v.), in Bengal. The tidal bore is characterized by its velocity, which endangers navigation, advancing at the rate of 15 miles an hour, and frequently attaining a height of nearly 20 feet.

Megrim. See MIGRAINE.

Mehemet, mā'hē-met, or **Mohammed**, mō-ham'ed, Alī, ā'le, viceroy of Egypt: b. Kavala, Macedonia, 1769; d. Cairo 2 Aug. 1849. An orphan, he was brought up by a janizary captain, governor of Kavala, who married him to a kinswoman and made him a militia officer. When the French invaded Egypt he was sent there, rose rapidly, became the confidant of Koshrew, pasha of Egypt, and, by treachery both to the pashas and the Mamelukes and by a liberal use of his wealth, in July 1805 became pasha of Cairo, whence his power quickly spread over the rest of Egypt. His utterly unscrupulous policy was shown by his massacre of nearly 1,700 Mamelukes in 1811. He extended the limits of Egypt by wars on the Arabian Wahabees, by the possession of Nubia and Kordofan, and by the treacherous conquest of Syria, in which he aimed at independence of the Porte. This first break with Turkey was settled by the Powers; and in 1839 the Sultan was forced to call on the Powers to help him turn Mehemet out of Syria; by the treaty then concluded he surrendered Syria, Candia, and Hejaz; but was made hereditary pasha. His internal administration was vigorous; both agriculture and manufactures flourished, thanks to French capital solicited by Mehemet, who introduced European methods into his army also. He was insane during the latter part of his life, and was succeeded by his grandson; his son, who took his place as regent in September 1848, died in November of that year.

Méhul, Etienne Henri, ā-tē-ēn ōn-rē mā-ül, French musical composer: b. Givet (Ardennes) 22 June 1763; d. Paris 18 Oct. 1817. He studied at Paris under Gluck; and after the departure of the latter for Vienna, Méhul presented to the Royal Academy of Music the opera of 'Cora and Alonzo,' the representation of which was delayed for six years. He then turned to the Opéra Comique, which gladly received his 'Euphrosine and Coradin' in 1790. His patriotic hymns, 'Chant du Départ,' 'Chant de Victoire,' and 'Chant Retour,' greatly increased his fame. He was chosen a member of the Institute in 1796, of the Academy of Fine Arts in 1816, and a knight of the Legion of Honor in 1802. His chief operatic work is 'Joseph' (1807). His style as a composer is remarkable for dramatic force and coloring. There is a 'Life' by Pougin (1889). His statue was erected in his native town in 1892.

Meibo'mia, a genus of erect perennial herbs of the pea family, of which about 150 species are natives of warm and temperate America, Africa, and Australia. More than 40 species belong to the United States, some of the more familiar of which are called "tick-seeds."

Meiggs, mēgz, Henry, American contractor: b. Catskill, N. Y., 7 July 1811; d. Lima, Peru, September 1877. He was engaged in the lumber business in New York and other places but met with financial reverses and in 1848 went to California, where he again took to the lumber business and gained an immense fortune. Reverses, however, once more swept away his wealth, leaving him with an indebtedness of more than \$1,000,000. He fled with his family to Peru, where he soon embarked upon a series of bridge- and railway-building enterprises, which won for him immense wealth and a world-wide fame as a railway contractor. His engineering achievements in South America comprise some of the most daring feats in the history of the profession. The construction of the Callao, Lima, and Oroya road, which crosses the Andes and ascends to a height only 136 feet lower than the summit of Mount Blanc, was his crowning achievement, and was practically completed at his death. He paid in full the enormous obligations incurred by his failure in San Francisco, contributed generously to charities in the United States and Peru, and by the laying out of a beautiful park, which he presented to the city of Lima, materially changed for the better the appearance of the city.

Meigs, Montgomery, American civil engineer: b. Detroit, Mich., 27 Feb. 1847. He was educated at Harvard and in Germany, and was for several years in the employ of the Northern Pacific railroad. Since 1882 he has had charge of the Des Moines Rapids Canal under the government. He is the inventor of a "canvas coffer-dam." He also constructed the United States dry dock at Keokuk.

Meigs, mēgz, Montgomery Cunningham, American military officer: b. Augusta, Ga., 3 May 1816; d. Washington, D. C., 2 Jan. 1892. He was graduated from West Point in 1836 and entering the engineering corps the next year was engaged in the construction of forts Delaware, Wayne, Porter, Niagara, Ontario, and Montgomery until 1852, when he took charge of the building of the great Potomac aqueduct. In

1860 he built Fort Pickens in Florida, and in 1861 was appointed quartermaster-general of the United States army and given rank as brigadier-general. He was promoted major-general in 1864, and in 1875-6 he was sent by the government to Europe to make an inspection of various staff-departments, the quartermaster's in particular. After his retirement in 1882 he was engaged in preparing plans for various public buildings in Washington. He was a regent of the Smithsonian Institution and of many scientific societies, and was at his death architect of the Pension building.

Meigs, Return Jonathan, American soldier and pioneer: b. Middletown, Conn., December 1734; d. at the Cherokee agency, Ga., 28 Jan. 1823. At the commencement of the Revolutionary War he raised a company of men and marched to the American camp at Cambridge, subsequently accompanied Arnold on his expedition against Quebec, where he was taken prisoner, and after his release was commissioned a colonel in the Continental army. He signalized himself by a brilliant expedition against a British post at Sag Harbor on Long Island, for which he received the thanks of Congress and a sword, and took a distinguished part in the capture of Stony Point under General Wayne, and elsewhere in the course of the war. In 1788 he emigrated to Ohio, and established himself at Marietta. In 1801 he was appointed by President Jefferson Indian agent of the Cherokees, among whom he passed the remainder of his life.

Meigs, Return Jonathan, American soldier and politician, son of the preceding: b. Middletown, Conn., November 1765; d. 29 March 1824. He was graduated from Yale in 1788, went to Marietta, Ohio, with his father in 1788 and rose to prominence there as a lawyer. He was chief justice of the Ohio supreme court 1803-4; served in the army as a brevet colonel 1804-6; was a judge in Louisiana 1805-6; and in Michigan for the two years following. After being senator from Ohio 1808-10 he was governor of that State for the next four years, in which period he was an active supporter of the war measures of 1812-14. He was postmaster-general of the United States 1814-23.

Meigs, William Montgomery, American lawyer and biographer: b. Philadelphia, 12 Aug. 1852. He was graduated from the University of Pennsylvania in 1872, studied law and was admitted to the bar in 1879. In addition to his law practice he has devoted much time to literary work and is author of 'Life of Joseph Meigs' (1887); 'Life of Charles Jared Ingersoll' (1897); 'The Growth of the Constitution' (1900); etc.

Meiklejohn, mī'k'l-jōn, George D., American lawyer: b. Weyanwega, Wis., 22 Aug. 1857. He was graduated from the University of Michigan in 1880 and established himself in a law practice at Fullerton, Neb., in that year. He held several public offices and in 1884 and 1886 was elected state senator. In 1889 he was elected lieutenant-governor of Nebraska and in 1893-7 served as member of Congress. He was appointed assistant secretary of war in 1897 and filled that post through the war with Spain, retaining his office after the resignation of Secretary Alger, until 1901, since which time he has been engaged in his law practice at Fullerton.

Meilhac, Henri, ōn-rē mā-yāk, French playwright: b. Paris 25 Feb. 1831; d. there 6 July 1897. His work as a dramatist begun in 1855, was attended at first by scant success, but he finally became a favorite playwright. Much of his work was done with Halévy (q.v.). He furnished the book for Offenbach's 'Grande Duchesse,' 'La Périchole,' and 'Les Brigands,' and other works of that composer. Among his independent plays are 'Petite Marquise' and 'Décoré.' In 1888 he was elected to the Académie Française.

Meiningen, mī'ning-ēn, Germany, the capital of the small Duchy of Saxe-Meiningen, in a narrow, well-wooded valley, on the Werra, 40 miles southeast of Erfurt. It is an attractive modern town with regular and handsome streets, having been practically rebuilt since the disastrous fire in 1874 which destroyed the old town. The principal buildings are the new town-house and the ducal palace with a church, private and public library, picture gallery, museum, etc., attached. The stock company of the local theatre which for sixteen years enjoyed a European reputation for the excellence of its acting and staging, was dissolved in 1890. The industries are only of domestic importance and include brewing, woolen and cotton-weaving. Pop. (1900) 14,518.

Meiningen Company, a celebrated company of German actors, under the management of Duke George of Saxe-Meiningen and the actor Chronégl. They gained the highest reputation for the historical accuracy and beauty of their scenery, dress, and mounting. They appeared at Drury Lane Theatre, London, in 1881. The company was dissolved in 1890.

Meissen, mī'sēn, Germany, a town of Saxony, founded by Henry I. in 922-33, 14 miles northwest of Dresden, on the left bank of the Elbe, at the confluence of the Meisse and Triebisch. It has a noble Gothic cathedral, of the 10th century; an old castle of the Margraves, erected in the 15th century on a precipitous rock above the town, recently restored, the Franciscan church, a large and magnificent edifice, used as the custom-house; the church of Our Lady, or city church; the ancient church of St. Nicholas; and other public buildings. The royal porcelain factory, first established by Boettcher (q.v.), and now at some distance from the town, is the great industrial establishment of the place; there are also manufactures of safety matches, stoves, iron foundries and machine-works, a jute-mill, breweries, etc. Meissen is the see of an archbishop. Pop. (1900) 20,123; since 1901, 31,432, owing to the incorporation of the suburban municipality of Cölln.

Meissonnier, Jean Louis Ernest, zhōn loo-ē ēr-nā mā-sō-nē-ā, French painter: b. Lyon, France, 21 Feb. 1815; d. Paris 31 Jan. 1891. He came to Paris in early youth and entered the studio of Cogniet, meanwhile forming his style on the Dutch masters as represented in the Louvre. He first attracted attention by his illustrations of the Bible, Bossuet's 'Universal History,' 'Orlando Furioso,' 'Paul and Virginia,' etc. His earliest paintings in genre to be exhibited in the Salon were 'The Little Messenger' and 'The Chess Player' (1836). His reputation grew rapidly on the

successive appearance of 'The Monk' (1838); 'The English Doctor' (1839); 'The Chess Party' (1841). The times of Louis XIV. and Louis XV. with all the accessory richness and variety of costumes, weapons and domestic luxury, began to find in him their most successful delineator. In the many canvases which he produced in this narrow department of genre he showed a keen and strong, but not too florid, power of characterization, which was accompanied with a marvellous technique in the handling of stuffs, metals, etc. But modern history eventually claimed his attention and he found a congenial field for the exercise of his special gifts in the campaigns of Napoleon. His pictures were often small, but finished with minute and delicate virtuosity, a good example of which may be seen in his 'Cuirassiers of 1805'; but he is perhaps less successful in large canvases and elaborate figure compositions than in his small paintings. Among his most famous pictures of the Napoleonic cycle are 'Napoleon I. with his Staff' and 'Napoleon III. at Solferino' (1864); 'Napoleon I. at Friedland' (1875), now in the Metropolitan Museum of New York. In his latter days he painted Venetian scenery and architectural views with his usual dash, thoroughness and originality. In his works he shows the best qualities of the Dutch school with all its life-like expression, truthfulness and spirit combined with the delicacy of French sentiment and abandon. His water colors, etchings and lithographs bear admirable witness to his versatility and vigorous industry. His pictures have always fetched a high price, 'Friedland or 1807' having been sold for \$60,000, a sum scarcely disproportionate to that given for smaller canvases. He is to be looked upon as the founder of the new school of military painters represented by his son Jean Charles Meissonnier and Edouard Detaille, his most illustrious pupil. Consult: Claretie, 'Meissonnier' (1881); Larroumet, 'Meissonnier' (1893).

Meistersingers, mī's'tēr-sing-ēr-z, or **Master-Singers** (German, *Meistersinger*), a society of German singers formed in the 13th century. During the long evenings of winter the worthy burghers of the German cities assembled to read the poems of the minstrels. Some of the hearers were naturally led to try their own skill in verse; others followed, and the spirit of the age soon embodied these votaries of the muse into societies after the fashion of corporations. Charles IV. gave them a charter and a coat of arms. They met on certain days, and criticized each other's productions, in which external correctness seems to have appeared to them the chief object; few, indeed, had an idea of the difference between poetical and prosaic ideas or expressions. Their attempts in the lyric style were chiefly limited to spiritual songs; in the epic to rhymed versions of the scriptural narratives. They were also fond of the didactic style. The rules by which the members of the societies were to be guided as to the metre, etc., of their compositions were written on a table, and called *tabulatur*, for the sake of enforcing a strict observance of purity in language and prosody. The chief faults to be avoided were collected; they were 32 in number, and distinguished by particular names. He who invented a new metre invented also a new tune, the names of which

were the drollest and sometimes the most senseless imaginable. Besides their stated meetings they held public meetings, generally on Sundays and festivals in the afternoon in churches. In Nuremberg, where the master-singers flourished particularly, such meetings were opened with free singing, in which anybody might sing, though not belonging to the corporation. In this the choice of the subjects was left comparatively uncontrolled; then followed the chief singing, when only those who belonged to the corporation were allowed to sing, and only on scriptural subjects. The judges were called *Merker*, and sat behind a curtain. There were four: one watched whether the song was according to the text of the Bible, which lay open before him; the second whether the prosody was correct; the third criticized the rhymes; the fourth the tunes. Every fault was marked, and he who had fewest received the prize, a chain with medals. Whoever had won a chain was allowed to take apprentices, to have many of whom was a great honor. Money was never taken from apprentices. After the expiration of his poetical apprenticeship the young poet was admitted to the corporation, and declared a master after having sung for some time with acceptance. These strange societies originated toward the end of the 14th century at Mainz, Strasburg, Augsburg, and continued in several free cities of the empire until the 17th, in Nuremberg to the 18th century, where probably the renown of Hans Sachs (q.v.), the famous shoemaker and poet, kept them longer in existence. The last society of the kind was that of Ulm, which was dissolved in 1839.

Mejerdā, mē-yēr'dā, the ancient BAGRADAS, a river of north Africa, formed by the union of several head-streams rising in the Atlas Mountains in Algeria, and flowing through Tunis to its outlet in the Mediterranean, 24 miles north of the city of Tunis. The mass of sediment which it brings down has enlarged its delta and changed the coast line, its mouth formerly being at Bu-Chateur, seven miles southward. Its whole course is about 200 miles.

Mekong, mā-kōng', or **Cambo'dia**, a river of Indo-China. See CAMBODIA.

Mela, mē'lā, **Pomponius**, a geographer who flourished during the 1st century of the Christian era, probably under the Emperor Claudius. Little more is known of him than that he was a native of Spain, and the author of a treatise in three books in the Latin language, '*De Situ Orbis*,' containing a concise view of the state of the world so far as it was known to the ancient Romans. Mela is edited by Tzschucke (1807), Parthey (1867), and Frick (1880).

Melampus, in Greek mythology, son of Amythaon, who was the first mortal endowed with the gift of prophecy, and who first practised the medical art. He is said to have introduced the worship of Bacchus into Greece.

Melancho'lia. See INSANITY.

Melanchthon, Græcized name of Philipp Schwarzerd (Eng. 'Black earth'), German reformer: b. Bretten in the Palatinate 16 Feb. 1497; d. Wittenberg 19 April 1560. He was left an orphan in his 10th year and taken into the house of his grandmother, a sister of Reuchlin (see REUCHLIN, JOHANN) the great German humanist, by whom he was affectionately treated

and encouraged in his studies. In his 12th year he entered the University of Heidelberg and two years later was graduated bachelor. While he was occupied as tutor to the son of Count von Löwenstein, he continued to give attention to his own progress in Greek; in 1514 was made master of arts at Tübingen and thenceforth devoted himself to humanism, lecturing on Cicero, Terence and Greek grammar. He also gave much time to the study of theology, jurisprudence and medicine. Here he first became acquainted with Erasmus' edition of the New Testament, and was through the influence of Reuchlin elected professor of Greek in the newly founded University of Wittenberg. He delivered an inaugural address (29 Aug. 1518), '*De Corrigendis Adolescentiæ Studiis*,' which produced a revolution in German educational methods and above all met with the approbation of Luther, professor of philosophy at Wittenberg. From this time Melanchthon became 'Preceptor Germaniæ' (The Schoolmaster of Germany), and the 'Ally of Luther.' These two champions of the Reformation were brought still closer together by their union at the 'Leipsc Disputation' (1519) in which they were confronted by Dr. Eck (see ECK, JOHANN VON) the great opponent of Luther and the movement he was inspiring. In his handling of this adversary, both orally and by his writings, Melanchthon showed himself to be the leader of Protestant controversialists and the most learned, judicious and ready of Protestant disputants.

In 1520 he married Katharina Krapp, daughter of the burgomaster of Wittenberg, and 'Master Philip,' as he was familiarly called, as he settled down to domestic life, was placed on the theological faculty of the university, and the first fruit of his increased application to theological study and teaching was his '*Loci Communes Rerum Theologicarum*,' which was the first declaration of the Protestant position delivered in formal terms of dogmatic theology. The volume ran through 60 editions in his life time, and established its author's position as Luther's complement—in some respects the lesser spirit of the Reformation movement, but the scientific talent which supported on the intellectual side the genius and the faith of Luther. Melanchthon, by his historic learning, by his power over the classic languages, was enabled to communicate to the learned world the real principles of the new movement and the facts of the past on which it was founded. He brought to bear his deep knowledge of theological philosophy, his acquaintance with the precise terms in Greek and Latin of scriptural, patristic and scholastic statement on the main question of the dispute, and he had the calmness of the well-balanced humanist which enabled him to direct with cool and even mind the movements of his party and to keep it as free as possible from the fury and blindness of intolerance. His knowledge of Greek made him as useful to Luther in translating the Bible as Parnell was to Pope in the production of his '*Iliad*.' His pen had an immense influence in securing the after success of the initiative taken by bolder but less cautious and reasonable spirits, and left a mark on the German Reformation deeper, more permanent and characteristic than that of any among his most enthusiastic contemporaries. His '*Epitome Doctrinæ Christianæ*' became from the

first an influence which establishes its claim to be called the pandect and code of European Protestantism.

The spirit of Melanchthon was distinctly irenic. The Reformation had resulted not only in a German revolt from the papacy, but in the creation of a host of jarring Protestant sects. Melanchthon's broad and far-seeing spirit was averse to division of any kind. The Augsburg Confession which was presented to the diet in 1530 surprised even the Roman Catholics by its moderate tone. It was drawn up by Melanchthon in accordance with memoranda supplied by Luther and it has all the breadth, calmness and judicial cautiousness of Luther's friend and good genius. But this spirit of compromise, hopefulness and patience was out of harmony with the passion for controversy which made Wittenberg a centre of storm and strife. Melanchthon, however, stuck to his post at Wittenberg long after the great power and influence he once wielded had passed from him, into the hands of more positive, violent and aggressive leaders. There occurred a breach between the Philippists, the followers of Melanchthon and the Lutherans, who adhered to the extreme views of his friend on the subject of free will and irresistible grace, on the doctrine of the Lord's Supper, and on the "adiaphora" indifferent matters, as the former was inclined to term the ceremonies of the Roman Catholic Church. He and his followers were assailed as "rogues" and "worshippers of Baal." Luther stated his own views on the sacrament with such violence that the recollection of his 'Short Confession respecting the Lord's Supper' filled him with remorse on his death bed, where he acknowledged to his friend "Dear Philip, I confess to have gone too far in the affair of the Sacrament." The death of Luther left Melanchthon to the mercy of such zealous and fiery sectaries as had been engendered in that teeming period of intellectual and theological movement, which the monk of Wittenberg had inaugurated. He survived Luther four years, waiting for death, he said "as a refuge from the phrenzy of theologians," and praying that the Protestant world might find its way at last to reunion, a prayer which as yet remains unfulfilled.

Melanchthon's important part in the Reformation movement has often been lost sight of in the blaze of Luther's more striking and popular personality. Yet he may with some reason, be called the brains of the Reformation. More than that, he was a man who, while he stood for progress, was averse to revolutionary change. In one sense he was the Mirabeau of a religious revolution, a constructive rather than a destructive reformer, a man born in a generation, which he could only affect by presenting an example of intellectual refinement, moderation, tolerance and conservation, which the warring giants of the Reformation refused to follow. In 1865 a statue was raised to him at Wittenberg, and in 1883 a group comprising Melanchthon and Luther at Leipsic. His works are found complete in 'Corpus Reformatorum,' 28 vols. (1834-60). Consult: Schmidt, 'Philipp Melanchthons Leben und ausgewählte Schriften' (1861); Richards, 'Philipp Melanchthon' (1898); Neander, 'Vita Quattuor Reformatum' (1846).

Melanesia, mēl-a-nē'shī-a, a collective name for the group of islands in the Pacific

Ocean inhabited by dark-skinned races, as distinguished from the lighter complexioned inhabitants of Micronesia and Polynesia (qq.v.). As such Melanesia comprises the islands stretching from the northeast of New Guinea to the tropic of Capricorn, and include Bismarck Archipelago, the Admiralty Islands, Solomon Islands, Queen Charlotte or Santa Cruz Islands, New Hebrides, New Caledonia, Loyalty Islands, and the Fiji Islands. The Melanesians (Black Islanders) are ethnographically allied to the Negroes more nearly than to the Polynesians, but their dialects are more closely related to the speech of the latter race.

Melane'sians, a collective name given the native inhabitants in the southwestern islands of the Pacific Ocean, including the Fiji Islands, New Caledonia, Solomon Islands, etc. In race and language, as well as in folk-lore and tribal customs, the Melanesians appear to have affinities with the Malays and Polynesians. The people vary in color from dark-brown to black.

Mel'anism, an excess of pigment in the skin and its appendages, producing real or comparative blackness; the opposite of albinism (q.v.). Melanism is less frequent than albinism, but more inclined to affect large numbers of individuals of a species, forming melanistic varieties. A conspicuous example is afforded by the American "black" squirrels, which are melanistic varieties of various species, especially the fox-squirrel (*Sciurus niger*) and the gray squirrel (*S. carolinensis*). These varieties prevail in certain parts of the country, as the region of the Great Lakes and upper Mississippi Valley, and rarely occur elsewhere. Thus a black squirrel is almost unknown in New England or the Hudson Valley. Another familiar example is found in the black leopards, which in a direct light seem absolutely black, but under reflected light betray a pattern of spots similar to those of the ordinary leopard. Such examples, as is the case with other melanistic animals, often occur in the same litter of young with normal forms. In many of the lower animals, as butterflies, melanistic tendencies are developed under certain conditions, especially of excessive moisture. The dark color of the negroid human races is of this nature, and is greatest in those inhabiting warm moist regions. The pigments in the skin are mainly of the class called Melanins, which produce dark hues. Total abnormal melanism in man is unknown, but cases of partial melanism are on record. In one instance one half of the face was white, the other black. The cause of this condition is unknown. Melanoderma, chloasma, and liver-spots are terms applied to irregularly shaped yellow, brown, and black colorations of the skin. Some of these spots are due to scratching following the bites of body-vermin, to prolonged pressure upon a portion of the skin, prolonged use internally of preparations of silver, to racial admixture, general diseases, such as cancer or tuberculosis, etc. See COLORING MATTERS; COLORATION, PROTECTIVE.

Mel'anite (Gr. "black"), a very blackish variety of garnet, especially the lime-iron variety, in which lime largely preponderates in the protoxides. Melanite occupies a place midway between schorlomite and the garnets pure and simple; this is notably true of the sort containing the rare element titanite (q.v.). The group includes all the darkish garnets, with the

exception (made by Dana) of the precious garnet, technically the pyrolite, which varies from red to black. With the green demantoids the blackish melanites make up the greater part of Dana's second class of garnets, the iron garnets. See, also, GARNET.

Melanorrhœa, mel'ā-nō-rē'ā. See VAR-NISH TREE.

Melano'sis. See TUMOR.

Melan'terite (Gr. *μελάντερος*, "blackier"), in mineralogy, the hydrous sulphate of iron; iron vitriol. It is the native form in which copperas occurs, is green in color and has a glassy lustre.

Melas'ma (Gr. "black spot"), a disease marked by discoloration of the skin. The term is rightly used in connection with a pigmentation of the skin, sometimes diffuse (color varying—dusky yellow, greenish brown, or even black), and believed to be dependent upon degeneration of the suprarenal capsules or the semilunar ganglia (see ADDISON'S DISEASE). Sometimes the term is applied to the conditions known as liver-spots and "moth-patches."

Melastoma'ceæ. See DEER GRASS.

Mel'ba, **Nellie**, Australian prima donna: b. Melbourne 19 May 1865. She studied there in the Presbyterian Ladies' College; then took up music under Marchesi in Paris. On 15 Oct. 1887 she made her début in Brussels in 'Rigoletto'; at that time gave up her family name Mitchell and took the stage name Melba, which is said to have been suggested by the name of her native city; in 1889 appeared in Paris at the Opera, where she stayed for three years, during which she appeared in London in Italian répertoire; and after 1892 toured Europe and America. Her best roles are Ophelia, Juliette, Lucia, and Nedda in 'I Pagliacci.' She was married to Charles Armstrong in 1882.

Melbourne, mēl'bērn, **William Lamb**, Viscount, English statesman: b. 15 March 1779; d. 24 Nov. 1848. Carefully trained by his mother, he entered Eton in 1790, Trinity College, Cambridge, in 1796, and Lincoln's Inn in 1797; studied law in Glasgow; was called to the bar in 1804; and in 1805 was elected to the House of Commons, where he followed Fox, leader of the opposition. He lost his seat in 1812 because of his vote for Catholic emancipation; was returned in 1816; served as chief secretary in Ireland in 1827; and in 1828 entered the House of Lords upon his father's death. Only then did he begin to figure in politics, and that only because of his popularity, for he had no official ability, being neither diligent nor brilliant. As home secretary under Grey in 1830 he was a failure; but in July 1834 the king induced him to form a ministry, and again in 1835, in spite of the king's effort to foist Peel on the country in November 1834, he became premier. He remained in office until August 1841, thus covering the early years of the reign of Victoria, whom Melbourne ably instructed in the duties of her position. His tuition of the young queen seems, however, the only event of his long administration, and he must be classed rather as a politician than as a great statesman, since he was scarcely more than indifferent to the reform measures of the day. He was a man of much learning, of a rather attractive, though coarse

and habitually profane, wit, and of a strange admixture of constitutional conservatism and political liberalism. His wife, Lady Caroline Ponsonby, whom he married in 1805, was separated from him in 1825; she wrote several novels and was a friend of Lord Byron. See NORTON, CAROLINE ELIZABETH.

Melbourne, Australia, the capital of the state of Victoria, and the largest city of Australasia, situated around Hobson's Bay, at the northern extremity of Port Phillip, 40 miles north of its entrance from the ocean between Points Lonsdale and Nepean. The city and its numerous suburbs occupy an extensive undulating area, with the Yarra River, a stream of no great size, winding through it. The central and most important business part of the city is on the north bank of the Yarra, two miles by a direct railway line from the river's outlet in Hobson's Bay, but nine miles by the meandering water route. The city is built on a rectangular plan with fine wide streets lined with handsome and substantial public buildings and residences. Numerous lines of railway connect with the interior and the extensive suburban districts, which include such important places as Collingwood, North Melbourne, Fitzroy, Carlton, Brunswick, South Melbourne, Richmond, Prahran, St. Kilda, Port Melbourne, etc. The city is well lighted, and paved, and is abundantly supplied with water, but the drainage, although much has been done toward its improvement, is still defective. Street railways traverse all the principal city and suburban thoroughfares. The public buildings are noteworthy. The Houses of Parliament form a remarkable pile with a splendid west façade. Government House is a palatial building conspicuous from every part of the city, with a tower 145 feet high. Other public buildings include the law courts, forming an extensive square, the post-office, the custom-house, the treasury, the land and mining offices, the mint, the free library with some 300,000 volumes; the university, with an admirable museum belonging to it and a splendid hall (the Wilson Hall) in the Gothic style; the Ormond Presbyterian College; the town hall, with a large assembly room containing a splendid organ; the exchange, athenæum, theatres, etc. The ecclesiastical buildings include an Anglican Cathedral, a Roman Catholic Cathedral; the Scots church, with a fine steeple; and several other fine churches. There are several "sky-scraper" office and store buildings; many banks and business premises are attractive; and the Exhibition building deserves notice. At the head of the educational institutions is Melbourne University, with which are affiliated the three denominational colleges, Trinity (Episcopal), Ormond (Presbyterian), and Queen's (Methodist). Charitable and benevolent institutions are numerous. There are several parks and other grounds for public recreation, and among these the Botanic Garden deserves special notice on account of its extent (100 acres), its beauty, and the value of its collection of trees and plants. The beautiful Fitzroy Gardens also deserve special mention. Melbourne is the see of a Roman Catholic archiepiscopate and of an Anglican bishopric. The United States is represented by a consul-general. The chief industrial products of Melbourne are leather, furniture, clothing, flour, ales, cigars, ironware, woollens, etc. The shipping trade is large both in

exports and imports, the chief of the former being wool and gold, of the latter manufactured goods. Most imports are subject to a heavy duty. There is access to Richmond above the centre of the city for fairly large vessels by the Yarra. Its navigation has been much improved recently and the Coode canal shortens the passage. The largest vessels are accommodated at Port Melbourne and Williamstown, both on Hobson's Bay; Port Phillip Bay affords unlimited anchorage for the largest vessels. Pop. of Melbourne city (1901) 63,380, and including the sixteen suburban municipalities 493,956. The first settlements on the site of Melbourne were made in 1835, and a year or two after it received its present name, being so called after Lord Melbourne, who was then British prime minister. It was incorporated in 1842, and became a bishop's see in 1849. In 1851 it became capital of Victoria (then established as a separate colony), and received an immense impetus from the discovery of gold fields.

A centennial exhibition was held in 1888 in celebration of the founding (in 1788) of the Australian colonies. A great conflict between labor and capital took place in 1890, and a strike by the labor-unionists took place on a very extensive scale both in Victoria and New South Wales. In 1892-3 Melbourne suffered severely from commercial depression, financial crises, and banking disasters. The first Parliament of the Commonwealth of Australia was opened in the Exhibition Building on 9 May 1901, by the Duke of Cornwall and York (now Prince of Wales). Consult: 'Victoria and its Metropolis, Past and Present' (1889).

Melchers, Paulus, German cardinal: b. Münster, Westphalia, 6 Jan. 1813; d. Rome 14 Dec. 1895. He studied law at Bonn, and theology at Munich and Münster; was ordained priest in 1841; in 1857 became bishop of Osnabrück; and in 1865 Pope Pius IX. nominated him archbishop of Cologne. At first opposing the doctrine of papal infallibility at the Vatican Council, Melchers afterward accepted it, in agreement with the majority, and dealt severely with professors who sought to prevent its declaration. In the Kulturkampf (q.v.), his conspicuous activity brought him into collision with the representatives of government, and in 1876 he was removed from his archbishopric. His writings include 'Eine Unterweisung für das heilige Altarsakrament' (1878); 'Die katholische Lehre des Herrn' (1883); and 'Das Leben der allerseiligsten Jungfrau und Gottesmutter' (1884).

Melchites, mēl'kīts, those Christians of western Asia and of the Levant who acknowledge the supremacy of the Roman Pontiff, and accept the dogmas of the Roman Catholic Church. The Syriac and Egyptian congregations of this name in the main belong to the Greek Church though in some unimportant matters of ceremony and discipline they take an independent course. They are, however, under a chief bishop of their own, who is styled Patriarch of Antioch. The term Melchites is a nickname. It means "Royalists" and was given to them by the orthodox Greeks with the implication that they accepted the decrees of the Council of Chalcedon merely at the dictation, or in conformity with the example of the emperor. Celibacy is imposed upon their bishops, but their priests are at liberty to marry. Their liturgy is in the Arabic lan-

guage; they use unleavened bread in the Eucharist and in their monastic houses they follow the Basilian rule. Consult Neale, 'History of the Eastern Church.'

Melchizedek, mēl-kīz'ē-dēk ("king of righteousness," that is, righteous king), in the story of Genesis, king of Salem and priest of "Supreme God." He met Abram on his return from the victorious expedition against Chedorlaomer, gave him his blessing, and received tithes from him. The ante-legal king-priest stands in Psalm cx. as a figure typical of the Messiah the vicegerent of Jehovah, and in Hebrews vii. 3, of the kingly priesthood of Jesus. The chapter in Genesis containing his story is a unique passage of the Pentateuch, and according to Wellhausen is one of its latest additions. Ewald counts it the earliest portion of the history, and based on old Canaanitish records; others, as Nöldeke, explain it as utterly unhistorical.

Melchthal, mēl'h'tāl, **Arnold von** (ARNOLD AN DER HALDEN), Swiss patriot. He is considered by some authorities to be a mythical character but was supposed to have lived in the 14th century. He incurred the wrath of the governor and was compelled to flee to escape punishment, whereupon the governor seized Arnold's aged father and had his eyes put out. The son, enraged at this barbarity, with two friends planned a revolt against the Austrian power which they successfully conducted. Consult: Ægidius Tschudi, 'Chronicon Helveticum' (1505-72).

Meldom'eter. See MELTING POINT.

Mel'drum, David Storrar, English author: b. Kirkcaldy, Scotland, 29 Aug. 1865. He was educated at the Edinburgh High School, soon after became a journalist, and has been for several years literary adviser to Blackwood & Sons. He has published: 'The Story of Margrédél' (1894); 'Gray Mantle and Gold Fringe' (1896); 'Holland and the Hollanders' (1899).

Meleager, mēl-ē-ā'jer, in Greek mythology, the son of Æneus, king of Calydon. He distinguished himself in the Argonautic expedition and more particularly at the Calydonian hunt, killed the bear and gave its skin to his beloved Atalanta, as a high token of regard.

Melendez Valdes, Juan, hoo-ān' mā'lēn'-dēth vāl-dās', Don, Spanish poet: b. Ribera del Fresno, Badajoz, 11 March 1754; d. Montpellier, France, 24 May 1817. He studied law at Salamanca, where he attracted attention by his poems in the old ballad manner and was taken up by the poet Cadalso. In 1780 he received the first prize in a competition under the control of the Spanish Academy for his pastoral 'Batilo,' and, in 1784, his comedy, 'Las Bodas de Camacho,' won a prize from the city of Madrid, although unsuccessful on the stage. In Madrid he won the favor of Jovellanos, who appointed him professor of the classics in the University of Salamanca and urged him to enter upon an unfortunate political career; he became judge in 1789, a judicial chancellor at Valladolid in 1791, and fiscal in the supreme court in Madrid in 1797. He suffered brief exile after the fall of Jovellanos (q.v.) in 1798; but in 1802 returned to Salamanca. His sympathy with France, however, made him more than ever unpopular, and after the expulsion of Joseph Bonaparte, he went into exile in France. He

MELETIUS—MÉLINITE

was one of the most prominent figures in Spanish literary life during the 18th century.

Meletius, founder of the sect of Meletians. He was bishop of Lycopolis in the 4th century, and antagonized Peter, patriarch of Alexandria, by refusing absolution and communion to the lapsed, that is, those who under the stress of persecution had renounced their faith. A schism resulted from the dispute and Meletius traveled through Egypt and Syria gathering thousands of followers, until the Council of Nicæa, 325, deprived him of authority and he died soon after, a merely titular bishop. Another Greek ecclesiastic of the same name and century was made bishop of Antioch in 360, when the Arian controversy was at its height there. He tried to reconcile both parties and was accepted by each as an adherent. He suffered banishment more than once, and was quite unsuccessful in healing the schism. He died while presiding over the Council of Constantinople in 381, and was buried with great pomp at Antioch, Gregory of Nyssa preaching his funeral sermon.

Melgarejo, Mariano, mǎ-rē-ā'nō māl-gā-rā'hō, Bolivian soldier: b. Cochabamba, Bolivia, 18 April 1818; d. Lima, Peru, 23 Nov. 1872. He entered the army at an early age and by his courageous though somewhat unprincipled conduct in the many revolutions in his country, rose to be chief adviser of General Acha in 1862 and was made a general. In 1864 he turned against Acha who was then president, instigated a revolution and seated himself in the presidential chair. During a brief absence of Melgarejo the ex-president Belzu returned and re-instated himself in the presidency only to be shot by Melgarejo himself, who then became dictator. He crushed a revolution in 1866 and in that year formed an alliance with Spain against Peru and Chile. Revolutions followed and he was compelled to flee the country in 1871 and was killed in a quarrel at Lima.

Melikoff. See LORIS-MELIKOFF.

Mellite, or **Mellilite**, a native silicate of sodium, calcium, magnesium, aluminum and iron, whose formula has not yet been satisfactorily determined. Potassium is also commonly present to some extent. Mellilite crystallizes in the tetragonal system, and has a vitreous or resinous lustre, and usually a honey-yellow color, from which circumstance it derives its name (Greek, "honey"). It is brittle, translucent (at least in thin layers), and distinctly pleochroic. It has a hardness of about 5, and a specific gravity of 3. The mineral occurs in basic eruptive rocks, and is also observed, quite frequently, in the slag from furnaces. It is sometimes called mellite.

Melilot, a genus of annual, biennial and perennial herbs of the natural order *Leguminosæ*. The species, of which there are about a dozen, are natives of western Asia and the Mediterranean region, and have become widely distributed in temperate and sub-tropical climates. They are upright, alfalfa-like plants with small yellow or white flowers which are borne from late spring until frost. The pods are few-seeded and not twisted as in the closely related genus, *Medicago* (q.v.). The two best known species are yellow melilot (*M. officinalis*), an annual, and white melilot (*M. alba*), a perennial, which are common weeds in waste places, the former

especially upon dry, clayey soils, the latter in damp situations. Like other members of the genus they are sweet-scented, particularly while drying, and their flowers are used to some extent for perfumery.

Meline, James Florant, American lawyer and author: b. Sackett's Harbor, N. Y.; d. Brooklyn, N. Y., 14 Aug. 1873. He was graduated at Mount Saint Mary's College, Emmettsburg, Md., and went to Cincinnati, where he was one of the professors at the "Athenæum"; and, while teaching, studied law. He was also one of the editors of the 'Catholic Telegraph.' After spending some time abroad in study and travel, he returned to Cincinnati, was admitted to the bar, and commenced the practice of law; later he relinquished his profession and established a banking business, also holding consulates for France and other nations. In 1860 his business failed, and shortly afterward he enlisted in the Federal army. He served throughout the Civil War under Gen. Pope, attaining the rank of colonel, and after the war was for two years chief of the Bureau of Civil Affairs in the third military district. At the end of that time he went to New York, and devoted himself to literary work, writing for the *Galaxy*, the *Nation*, and the *Catholic World*. In the latter periodical he first published the articles controverting Froude's statements and conclusions in regard to Mary Queen of Scots; these articles, which aroused wide interest, were afterward revised and published in book form under the title 'Mary Queen of Scots and Her Latest English Historian' (1871). He also wrote: 'Two Thousand Miles on Horseback' (1867); 'Commercial Travelling' (1869); and 'Life of Sixtus the Fifth' (1871).

Mélinite, mǎ'lin-it, an explosive employed by the French government in charging torpedo shells and in the preparation of rupturing charges for the use of the engineer corps and cavalry in effecting demolitions. As originally used it was composed of 70 per cent of picric acid mixed with 30 per cent of pyroxylin dissolved in 45 parts of acetone. As now used, either alone, or with cresylite, it consists exclusively of fused picric acid which is poured into the shell when in the molten condition and is cast there in such a manner as to leave a central canal in the mass in which the fuse, terminating in a mercuric fulminate detonator by which the charged is fired, may be contained. By the use of this fuse the detonation of the charge is delayed sufficiently to allow the shell to penetrate armor and reach the farther side of it before the charge explodes. Mélinite was very thoroughly tested at Bouchet in 1892 to determine the degree of safety that it possesses when exposed to shocks, fire and the accidental rupture of receptacles containing it, and the results were most favorable. Yet there have been several very serious accidental explosions with it which have been attributed to the formation of sensitive picrates through reaction of the charge with foreign bodies in the shell. The explosion of mélinite is not a complete one, since the gaseous product contains considerable quantities of carbon monoxide which is readily combustible. It is also very poisonous. This explosive owes its name to the yellow color which is one of its chief characteristics.

Meliorism. See **PROGRESS**.

Melis'sa, a plant. See **BALM**.

Melissus, mē'lis-ūs, Greek philosopher: b. Samos, about 480 B.C. He was the son of Ithagenes, and is said to have been a friend of Heraclitus, and to have commanded the fleet opposed to Pericles in 440 B.C. in the Samian war. Some fragments of a prose work of his, written in the Ionic dialect, have come down, and have been collected and published by Brandis and by Mullach (1846). From these he appears to have been a philosopher of the Eleatic school, and to have reached more definiteness and consistency than Parmenides.

Melita, mē'lī-tā, the island on which Saint Paul, on his voyage to Rome, was cast away. This has generally been considered to be the Island of Malta, the ancient name of which was Melita, and one of whose bays has from immemorial time borne the name of St. Paul; but some critics have attempted to prove that it was an island (the modern *Meleda*) on the coast of Salmatia, in the Adriatic.

Mel'itose. See **RAFFINOSE**.

Melkart (Phœnician, "God of the City"), name of the presiding deity of the city of Tyre, and of the whole Tyrian nation, namely Baal (q.v.), the sun god. He is sometimes identified with the Heracles or Hercules of the Greeks. He was the patron god of mariners, and the Phœnician colonies of the West, in Africa and Spain were under his protection. To him has been ascribed the subjugation of the savage races who anciently peopled these regions and the building of early Phœnician towns. The institution of order and legislation in these cities was also said to have been his work. Many are the voyages which he is related to have made. One of his exploits was the rescue of Astarte from the darkness in which the moon had imprisoned her in the west; he afterward made her his wife. For an account of the Temples of Melkart at Tyre consult Jeremias, 'Tyrus bis zur Zeit Nebukadnezars' (1891).

Mel'kites. See **MELCHITES**.

Mell, Patrick Hues, American educator: b. Walthourville, Ga., 19 July 1814; d. Athens, Ga., 26 Jan. 1888. He was educated at Amherst and after teaching for several years was appointed professor of ancient languages at Mercer University in 1842 and was also ordained a Baptist minister in that year. In 1856 he was appointed to the same chair in the University of Georgia, and in 1870 he became vice-chancellor, which post he resigned in 1872. In 1878 he was appointed chancellor, and in 1880 was elected to the chair of metaphysics and ethics, which offices he occupied at his death. He held several pastoral charges and was president of different conventions in addition to his educational work and published: 'Baptism' (1852); 'Parliamentary Practice' (1868); 'Church Polity' (1878).

Mell, Patrick Hues, American scientist: b. Penfield, Ga., 24 May 1850. He was a son of the preceding, was graduated at the University of Georgia in 1871 and was State chemist in 1874-7. In 1878 he was called to the chair of geology and botany at the Alabama Polytechnic Institute and continued in that position until 1902, when he accepted the presidency of the South Carolina Agricultural and Mechanical College. In addition to his work in the universities he was con-

nected in 1884-1902 with the Alabama Weather Bureau and the Agricultural Experiment Station and he invented a system of weather bureau signals which has been adopted by the United States Weather Bureau. He is a member of various historical and scientific societies and has published: 'Southern Soapstones and Fireclays' (1882); 'Study of Cotton Plant' (1890); 'Life of Patrick Hues Mell, Sr.' (1895); 'Biological Laboratory Methods' (1902); etc.

Mellen, mē'ĕn, **Grenville**, American poet: b. Biddeford, Maine, 19 June 1799; d. New York 5 Sept. 1841. The eldest son of an eminent chief justice of Maine, he was graduated at Harvard College in 1818, studied law with his father in Portland, was admitted to the bar, and in 1823 he engaged in the practice of his profession. In 1829 he collected from his prose contributions to periodicals a volume entitled 'Glad Tales and Sad Tales.' His principal collection of poems, entitled 'The Martyr's Triumph, Buried Valley, and Other Poems,' was published in 1833. The 'Martyr's Triumph' is in the Spenserian stanza, and is founded on the history of St. Alban; the 'Buried Valley' describes the avalanche near the notch in the White Mountains by which the Willey family was destroyed. His verse is pleasing, but in general shows promise rather than performance.

Mel'ilite. See **MELLILITE**.

Mellitic Acid, **Mellic Acid**, or **Benzene Hexa-carboxylic Acid**, an organic acid having the formula $C_{12}H_6O_{12}$, or $C_6(COOH)_6$. It may be prepared by oxidizing charcoal with potassium permanganate, $KMnO_4$; but it is best obtained from its aluminum salt, which occurs native as the mineral mellilite (q.v.). The pulverized mellilite is boiled with ammonium carbonate, ammonia is added to throw down the aluminum, and the filtrate is evaporated until the ammonium salt of the acid separates out. This is re-dissolved, precipitated by lead acetate, and the precipitated mellate of lead is decomposed with sulphuretted hydrogen gas, which liberates the acid in the free state. Mellitic acid is readily soluble in alcohol and in water, and from its alcoholic solution it crystallizes in the form of silky needles. Heat decomposes it, with liberation of carbon dioxide, and the formation of a new substance, $C_{10}H_6O_8$, known as "pyro-mellitic acid." Numerous salts of mellitic acid (known as "mellates") have been prepared, but neither the acid nor its compounds are of any special industrial or scientific importance.

Mello, Custodio José de, koos-tô'dē-ô hō-sā' dā mā'lō, Brazilian admiral: b. about 1845; d. 16 March 1902. In 1889 he took a prominent part in the revolution, was promoted to be admiral, and was appointed minister of the navy. Four years later he formed a plot in behalf of the Federal party and the navy, against the party of the army and its candidate for reelection, President Peixoto; bombarded and blockaded Rio de Janeiro; and, when forced out of the harbor by vessels of foreign navies, notably American, occupied Rio Grande do Sul. He could not agree with his lieutenant, Saraiwa, however, and so surrendered to the government of Argentina. In 1901 he was accused, in spite of his former republicanism, of plotting to establish an empire, and was interned upon the island of Cobras.

Melloni, Macedonio, mǎ-chā-dō'nē-ō mēl-lō'nē, Italian physicist: b. Parma 11 April 1798; d. Portici, near Naples, 11 Aug. 1854. He first became professor of natural philosophy at the University of Parma, where between 1824 and 1831 he taught hygrometry. Political events having compelled him in the latter year to expatriate himself, he went to Geneva, where he made several important discoveries respecting the radiation of heat, which he presented in 1833 to the French Academy of Sciences. Later discoveries won him the Rumford medal from the Royal Society of London. Through the influence of his friends Arago and Humboldt, he was enabled to return to Italy, and was appointed by the king of Naples director of the meteorological observatory on Mount Vesuvius. Among the results of his labors at this institution was the discovery of heat in lunar light, which led to the determination of the analogy of radiant heat to light. Political troubles again interrupted his labors, and for his presumed sympathy with liberal principles he was in 1849 ejected from his post. In 1850 he published the first volume of a work entitled 'La termocasi, o la colorazione calorifica,' containing an account of his theory of the "coloration of light," and of his experiments on the diffusion of heat by radiation, and particularly of its transmission through transparent media. Subsequently he gave much attention to the study of electricity, and combated the conclusions of Faraday with regard to the transmission of currents over submarine wires.

Melocactus, a cactus typical of the tropical American melon-cactus family, *Melocactidae*. It consists of a globose or conical stem, having rows of spines at intervals and flowers at the top on a hemispherical or cylindrical head. *M. communis* of the West Indies is the Turk's, Englishman's, or Pope's-head cactus. The head bearing the flower is red, and like a Turkish fez in form.

Melo'deon, a musical wind instrument with a row of reeds and operated by keys. The rocking melodeon, known in America since about 1825, was unsightly, tardy in sounding, and of harsh tone. Jeremiah Carhart in 1815 conceived the plan of acting on the reeds by suction instead of blowing, and reversed, to this end, the bellows and reeds, inventing the present instrument in 1836. He thus secured prompt sounding, and a flute-like quality of tone; "voiced" the note by curving the reeds; and made many other improvements. In a single year 22,000 of these instruments have been manufactured in the United States, although there is no longer any great demand for them.

Melodrama (from the Greek *melos*, song, and *drama*, action), originally and properly a half-musical drama, or that species of drama in which the declamation of certain passages is interrupted by music. It is usually a tragedy of common life, filled with surprises, acts of violence, and all that excites and sustains the attention of the audience, mixed up with dancing and music, and sometimes with scenes of a rudely comic character. Probability is freely sacrificed for the sake of striking situations. See **DRAMA**, **THE**.

Melody, in music, a succession of single tones so arranged as to express a musical thought. A solo for one instrument or voice

with or without accompaniment is the most typical example of a melody. A curious exception exists in a song with piano accompaniment by Peter Cornelius called 'Ein Ton' (Monotone) in which the voice part consists throughout of but one note repeated many times. Here the slight suggestion of melody that exists is entirely in the accompaniment.

Melody is one of the most comprehensive terms used in music, being properly applicable to as few as two notes or to as many as the entire principal vocal or instrumental part of a composition. An example of the first is the motif of woe in Wagner's 'Der Ring des Nibelungs.'

Examples of the latter are too numerous to require mention.

The term is also appropriately applied to a phrase or portion of a phrase in a part that has been subordinate to the principal one and which for a moment gains importance on account of its greater melodic significance. In concerted music, vocal or instrumental the highest part is usually the melody, though as stated above an inner one may temporarily assume it. In polyphonic music all the parts are equally melodic.

Melody is the outgrowth of the improvised recitatif. The early Greek singer standing before his audiences holding his four-stringed lyre or chelys, χελύς, plucked a string and recited his poem on that note until fancy impelled him to change it. From this crude ancestor has sprung melody as we understand it to-day, which with rhythm and harmony form the great trinity necessary for the complete expression of music. Melody is the only one of the three capable of suggesting enough of the other two to be satisfactory by itself. The folk-song of old and the popular song of to-day may be sung by a single voice without any accompaniment

"Also sprach Zarathustra"—Richard Strauss.

and yet convey a very definite idea of the rhythm and something of the harmony that would naturally accompany the tune. Such a performance is, of course, incomplete and only effective in music of the simplest character. Yet it conveys much more than the mere rhythm of the tune played on a drum would give and still more than the mere harmony played without either the melody or the rhythm. It is curious that the Greeks with all their extraordinary achievements in all other forms of art should have advanced so little in music. No doubt they used music in their religious feasts and the cross flutes *παραπλινδο* and lyres supplied what they must have thought melody, but they do not seem to have ever dreamed of musical accent or rhythm, without which we cannot to-day call a succession of sounds melody, while harmony was unthought of for many centuries.

Melody is greatly affected by the harmony that the composer has wedded to it, and it is to this fact perhaps more than any other that originality continues possible, for with but twelve

different notes from which to form a melody it is evident that even with all the variations that rhythm can add the melodic material is capable of exhaustion in the enormous and growing number of compositions. The following phrases of melody, especially the first, have no particular suggestion played alone:

but with the harmony that the composers have added they have an entirely different signifi-

Motif of Fate
"Die Walküre"—Wagner.

cance, the one of great solemnity and foreboding, the other of harsh cynicism and sneering.

HENRY GORDON THUNDER,
Conductor Choral Society of Philadelphia.

Melo'idæ. See BLISTER-BEETLE.

Melon-cactus, or Melon-thistle. See MELOCACTUS.

Melon-pear, or Shrub. See MELONS.

Melons, a popular name for several unrelated plants, but more particularly for two members of the order *Cucurbitaceæ*, the muskmelon (*Cucumis melo*) and the watermelon (*Citrullus vulgaris*). The more important other fruits similarly known are the Chinese preserving melon (*Benincasa cerifera*) of the same order; the melon papaw (*Carica papaya*) of the order *Passifloraceæ*; and the melon-shrub or melon-pear (*Solanum muricatum*) of the natural order *Solanaceæ*.

The muskmelon is an annual trailing herb which has been introduced by man into all tropical, sub-tropical and many temperate climates from southern Asia where it is native. It is characterized by long, running, hairy and somewhat prickly vines, roundish heart-shaped leaves, yellow monœcious flowers, and usually edible fruits of very various forms and sizes. The following are the principal botanical varieties or sub-species: Variety *cantaloupensis*, the cantaloupes, or rockmelons, which have hard, warty, or scaly rinds more or less furrowed, and flesh of various colors from white to red, green or yellow. In the United States the name "cantaloupe" is loosely applied to horticultural varieties of other groups. Variety *reticulatus* includes the nutmeg or netted melons which have softer rinds, sometimes smooth but usually more or less netted. To this group belong the larger part of the so-called cantaloupes in American markets. Variety *saccharinus* comprises the pineapple-melons which have very sweet flesh but are not clearly distinct from the preceding group.

Variety *inodorus*, the winter muskmelons, which have less hairy, lighter-colored vines and foliage, and whose long-keeping fruits are deficient or entirely lack the characteristic musk-melon odor. This group is less cultivated in the United States than in the Mediterranean region; but be-

cause the fruits can be kept until Christmas or later when properly grown, gathered before frost, and slowly ripened in a cool, rather dry room, they should become more widely popular where the seasons are long enough to permit their reaching such a stage of maturity. Variety *flexuosus*, the snake-melons or cucumbers, have very long, narrow, greenish, contorted fruits, prized more as oddities than for economic uses, though often used for making preserves. They are distinct from the snake-gourds which belong to the genus *Lagenaria*. A variety *chito*, called orange-melon, melon-apple, garden-lemon and many other popular names, bears orange- or lemon-like almost scentless fruits with white or pale yellow flesh, which is grown to some extent for preserving. Variety *dudaim*, the pomegranate-melon, Queen Anne's pocket-melon, dudaim melon, etc., has small brown and yellow fruits valued solely for their exquisite perfume.

Melons are propagated wholly by means of seeds, which may be sown directly in the field or started under glass upon inverted sods, in flower-pots, berry-boxes, etc., and transplanted to the field as soon as danger of frost has passed. The former method is practised most extensively in the South, and in other warm climates where the seasons are long; the latter in the North because the shortness of the season demands that the plants obtain an early start. The soil best suited to melons is a light sandy loam well drained, well exposed to the sun and well supplied with plant-food. It should be deeply plowed, thoroughly harrowed and kept clean of weeds, especially before the plants are set and until the vines cover the ground. After harrowing, the ground is marked in checks about five feet square, and ten or twelve seeds, or five or six plants, are set in each "hill," from which all but the two or three strongest vines are removed after the insects have had their share. Often, especially upon rather poor or tenacious soils, two or three shovelfuls of well rotted manure is mixed with the earth of the hills to give the plants a little impetus. The fruits are gathered when they will readily separate from the stems, preferably in the early morning.

During the closing decade of the 19th century the demand for highly flavored melons was greatly increased by the appearance in the eastern markets of the Rockyford melon, a small fruit grown in Colorado. Its appearance in large quantities drew public attention to numerous other high flavored melons grown in other sections. As a consequence, many inferior varieties have nearly disappeared from cultivation. With the exception of the Colorado melon fields there is no extensive exporting region in the United States devoted to this crop, the crop of each Southern State being mainly consumed in local markets. New Jersey, Maryland and Delaware produce immense quantities, the first-named State especially; and the product is consumed largely in the cities of Pennsylvania and New York. The Mississippi Valley States also send considerable quantities to northern markets.

The watermelon is an annual trailing herb, a native of tropical and southern Africa, whence it has been introduced by man into all tropical, sub-tropical and many temperate climates for its watery sweet fruits, which sometimes weigh more than 75 pounds, but usually range between 20 and 50 pounds. The vines are more hairy, lighter green, longer running than those of the

muskmelon and the leaves are deeply notched, in some cases approaching the compound form. Except for a horticultural group of firm-fleshed varieties known as preserving watermelons or more popularly as citrons, the watermelon seems to have no varieties worthy the name of subspecies or botanical varieties, and even this group appears not to have received such designation.

In general, the watermelon requires the same treatment as the muskmelon, the soil being, if anything, lighter and more sandy, and the distances between hills about double, except for the smaller growing sorts. The principal producing regions are Georgia and Colorado, but the watermelon is grown largely in all the Southern States, and some of the short-season varieties as far north as Michigan and Ontario. The watermelon has much better shipping qualities than the muskmelon, since the tough-rinded kinds may be placed in cars two or more feet deep, the smaller specimens upon the bottom, and shipped long distances. Muskmelons, being more delicate, must be barreled or crated. The fruits are used exclusively in the raw state, and have no by-products such as vinegar, sugar, syrup or brandy. The rinds, however, when deprived of the hard exterior, are often preserved with raisins, etc.

Both muskmelons and watermelons are subject to the attacks of several insects, among which the small, black, striped cucumber-beetle (*Diabrotica vittata*), the squash vine-borer (*Melipotis ceto*), the melon-caterpillar (*Margarotia hyalinata*), the cucumber flea-beetle (*Crepidodera cucumeris*), the squash-bug (*Anasa tristis*), and the melon-louse (*Aphis gossipii*) are the most important. Tobacco dust and plant protectors are largely used to prevent the attacks of the first, the adults of which feed upon the under sides of the leaves and the larvæ upon the roots. The melon-louse is fought with kerosene emulsion sprayed upon the under sides of the leaves, or by fumigation with carbon disulphide. No effective remedy has been suggested for the borer. Arsenical sprays have been recommended for the caterpillars and other chewing insects. Since the insects are believed to spread diseases from plant to plant, melon-growers seek to prevent insect injury as far as possible and practicable. The diseases, of which a large number have been described, are much the same as attack cucumbers, and may be similarly controlled where control has been found possible. Some diseases, as wilt, have defied all tried remedies. This disease generally ruins the vines a week or ten days before the fruits would be ready to harvest. Many of the complaints as to the poor quality of eastern-grown muskmelons result from the sale of melons that have been gathered from blighted fields.

Consult: Bailey, 'Cyclopedia of American Horticulture,' New York, 1900-2.

M. G. KAINS,
Crop Expert.

Mel'opian'o, an invention by which sustained sounds can be produced on a pianoforte. It consists of a series of small hammers set into very rapid vibration by the winding up of a spring. See MUSICAL INSTRUMENTS, MECHANICAL.

Melos, mē'lōs, Milo, or Milos, Greece, an island in the Ægean Sea, the westernmost of the Cyclades, about 65 miles east of the Morea. Its

length, east to west, is about 14 miles, and it is about eight miles in extreme breadth; area, 64 square miles. It is mountainous, of volcanic formation, has hot mineral springs, and mines of sulphur. The island was once famous for its riches, fertility, and population, and corn, wine, cotton, oranges, and other fruits are still grown. Sulphur, manganese ore, millstone, gypsum, etc., are exported. Kastron is a large village on the north coast. The island of Melos was first colonized by Phœnicians, and afterward by Dorians. During the Peloponnesian war it was the faithful ally of Sparta till 416 B.C., when it was taken by the Athenians and its inhabitants massacred or sold as slaves. From 1204 till 1537 it formed part of the Venetian duchy of the archipelago. At the latter date it was taken by the Turks, with whom it remained till the epoch of Greek independence. In 1820 a peasant discovered here the celebrated statue known as the Venus of Milo, now placed in the Louvre at Paris; the Poseidon in the National Museum at Athens was also discovered here. There are numerous interesting archæological remains, chief of which are those of the Hall of the Mystæ on the site of the ancient capital near the village of Klima, and those of prehistoric Phylakopi, which were excavated by the British School at Athens from 1896 to 1899.

Melpomene, mēl-pōm'e-nē, one of the Muses, daughter of Zeus and Mnemosyne. She presided over tragedy, and was generally represented as a young woman with vine leaves surrounding her head, and a tragic mask covering her face.

Mel'rose, Mass., city, in Middlesex County; on the Boston & Maine railroad; about eight miles north of Boston. It was settled about 1632, and until 1649 it was a part of Charlestown. It remained a part of Malden until the next year (1650), when it became a separate municipality. It was chartered as a city in 1900 and includes the villages of Fells, Wyoming, and Melrose Highlands. It is a residential suburb of Boston, but has considerable manufacturing. The chief manufactures are rubber boots and shoes. The State Reservation, Middlesex Fells, 1,800 acres, and Spot Pond, a natural reservoir, are attractive features. The government is vested in a mayor, elected annually, and a council. The subordinate officials are chosen by the mayor and council; the school board are chosen by popular election. Pop. (1890) 8,519; (1900) 12,962. Consult: Drake, 'History of Middlesex County.'

Melrose, Scotland, a village of Roxburghshire, on the Tweed at the base of the Eildon Hills, three miles north of Abbotsford, the home of Sir Walter Scott, whose 'Lay of the Last Minstrel' gave Melrose and its ruined abbey world-wide celebrity. The village in 1901 had a population of 2,195. The famous abbey, now the property of the Buccleuch family, is admitted to be the most beautiful of all the ecclesiastical ruins in Scotland. The architecture is in the late flamboyant Gothic style, and the chief remains are part of the nave, the transept, choir, and the southern aisle with several chapels, of the abbey church, and fragments of the cloister. The church originally was 258 feet long, with a width at the transepts of 137 feet. It was founded by King David I. in 1136; destroyed by Edward II. in 1322, and rebuilt by Bruce in

1326. It was partly demolished by the English in 1545.

Melting Point, the temperature at which the solid and liquid states of a body can coexist, without the fluid part of the mixture solidifying, nor the solid part melting. The melting point of a body which is crystalline in nature (like ice) is usually quite definite, and a body of this kind, when it melts, passes at once from a state of perfect solidity into a state of perfect fluidity. The melting point of an amorphous body, such as wax or pitch, is often very indefinite; and when a solid of this sort is gradually heated it grows soft and passes into the fluid state by a process which is practically (or even absolutely) continuous. The phenomena of the fusion and solidification of amorphous bodies like wax are not yet understood as well as those that attend the change of state of a crystalline body; and it is to be understood that what follows in the present article is stated with particular reference to the crystalline class of substances, in which the melting point is definite.

In general, solid bodies expand upon melting, the original solid having a greater density than the liquid that results from its fusion. In the case of water, as is well known, the reverse is true; the fact that ice floats in water proving that the water is denser. The fact that the density of a substance changes upon fusion implies (as may be proved by the mechanical theory of heat) that the melting point of the substance cannot be entirely independent of the pressure. This fact was first discovered in 1849 by James Thomson, who showed that the melting point of a substance like ice, which contracts upon melting, must be lowered by pressure; while the melting point of one which expands upon melting must be raised by pressure. These theoretical conclusions have since been abundantly verified by experiment. In the case of ice, for example, it has been found, by Dewar, that the melting point is lowered by 0.0130° F. per atmosphere of increase of pressure, up to 700 atmospheres.

When a substance passes from the solid to the liquid state, it absorbs a very considerable amount of heat, which is known as the "latent heat of liquefaction"; and the liquid which is formed cannot be all reduced to the solid state again until an exactly equal quantity of heat has been abstracted from it. When heat is added to a mixture composed of a solid and its liquid (pounded ice and water, for example), it does not increase the temperature of the mixture, but merely causes a certain amount of the solid to melt. This continues so long as any of the unmelted solid remains; each addition of heat merely bringing about a corresponding amount of liquefaction, while the temperature of the mixture remains unchanged. It is only after all of the solid has melted that the further addition of heat will produce elevation of temperature. The melting points of compounds undoubtedly depend, in some manner, upon their molecular constitutions, but we have, as yet, no definite knowledge of the nature of the dependence. We know that in a homologous series of organic compounds, the melting points show a strong tendency to increase, as the molecular weights of the members of the series increase; but the change in the melting points is irregular as we proceed from member to member, and no law

has yet been discovered which takes the changes fully into account. The melting point of a mixture (such as an alloy) is often lower than that of any one of the constituents, and the effect of the presence of an impurity in a given substance upon the melting point of that substance is often out of all apparent proportion to the quantity of impurity present. This fact implies that in the determination of a melting point it is highly important that the substance under examination shall be as nearly pure as possible. The presence of slight, unrecognized, and apparently negligible impurities has sometimes led to entirely erroneous conclusions. In 1860, for example, Kolbe announced the discovery of an acid isomeric with benzoic acid, but having a lower melting point; but Beilstein afterward proved that the substance in question was merely ordinary benzoic acid contaminated with a quantity of chlorobenzoic acid so small as to be barely recognizable by analysis.

For determining the melting point of minerals, the instrument devised by Joly, and known as the *meldometer*, is sometimes very convenient. It consists essentially of a strip of platinum foil, upon which small fragments of the mineral are laid. The platinum is then gradually heated by the passage of an electric current, until the mineral melts; the temperature of the foil being obtained by a calculation based upon the resistance of the platinum, the observed strength of the current, and the rate at which heat is radiated from the foil, as determined by separate observations. This method is especially useful for minerals which can be had only in small fragments.

Mel'ton Mowbray, mō'brē, England, an ancient market town in Leicestershire, 14 miles northeast of Leicester, on the right bank of the Wreak, at the junction of the Eye. Melton Mowbray is famous for its pork-pies, five tons a week being exported, and is also celebrated for Stilton cheese. Melton Mowbray, however, owes its prosperity chiefly to being the seat of the Melton Hunt, which attracts the sporting world in great numbers during the winter months, extensive and luxurious hunting establishments being maintained here. Pop. (1901) 7,454.

Melt'zer, Charles Henry, American playwright and journalist: b. London, England, 7 June 1853. He was educated in Paris, where he became correspondent of the *Chicago Tribune* and later of the *New York Herald*, for which paper he traveled over Europe and Egypt. In 1888 he was appointed dramatic critic of the *New York Herald*, holding that position for four seasons. From 1893 to 1896 he was dramatic reviewer of the *New York World*. His experience was utilized as literary associate in connection with a course of modern plays at Carnegie Lyceum, New York, and in Washington, Boston, and elsewhere. Among his plays are: 'The Story of Rodion the Student,' and English versions of 'Hannele' (Hauptmann), 'Mme. Sans Gêne' (Sardou and Moreau), 'L'Arlesienne' (Daudet), 'The Sunken Bell' (Hauptmann); and a farce, 'His Honor the Mayor' (with A. E. Lancaster).

Melusina, mēl-oo-sī'nā, in French superstition, a beautiful nymph or fairy, who is represented as the daughter of Helmas, king of Albania, and the fairy Persine; and as having married Raymond, Count of Toulouse, who built the

MELVILLE — MELVILLE SOUND

magnificent castle of Lusignan. Like most of the fairies of that period, she was doomed to a periodical metamorphosis, during which the lower part of her body assumed the form of a fish or a serpent. On these occasions she exerted all her ingenuity to escape observation; but having been once accidentally seen by her husband in this condition, she swooned away, and soon afterward disappeared. Her form is said to be seen from time to time on the tower of Lusignan, clad in mourning and uttering deep lamentations. Her appearance was believed to indicate an impending calamity to the royal family.

Melville, mēl'vil, or Melvill, Andrew, Scottish reformer: b. Baldovie, near Montrose, Forfarshire, 1 Aug. 1545; d. 1622. He was educated at the grammar school of Montrose and the University of Saint Andrews; studied two years (1564-6) at the University of Paris; went to Poitiers to pursue his studies in the law; there became regent in the College of Saint Marceon; and through the influence of Beza received an appointment to the chair of humanity in the academy at Geneva. Returning to Scotland in 1574, he was at once appointed principal of the University of Glasgow, and in 1580 was made principal of Saint Mary's College, Saint Andrews. In 1582 he presented a petition to King James against the undue interference of the court in ecclesiastical affairs, for which he escaped imprisonment by going into England. Returning in 1585, he resumed his duties at St. Andrews, and was moderator of the General Assembly in 1587, 1589, 1594. In 1606 he was summoned to London by the king to confer on church matters, but because of his outspokenness he was committed to the Tower, and there remained until 1611. He was then released upon the solicitation of the Duke of Bouillon, retired to France, and became professor in the university at Sedan, which, according to some accounts (others say London), was the place of his death. Consult 'Lives' by McCrie (1819); Morrison (1900).

Melville, Sir George, British administrator: b. Aberdeen, Scotland, 1 July 1842. He was educated by private tutors and at Edinburgh Academy. By competitive examination he entered the imperial service in 1862; was transferred to the colonial civil service in 1874, and appointed treasurer of Sierra Leone, the next year acting also as colonial secretary of that colony. In 1879 he was made assistant government secretary of British Guiana; in 1889 was appointed colonial secretary of British Honduras, and during the next two years administered the government, for which he was decorated. The government of the Falkland Islands was administered by him in 1893, that of the Bahamas in 1894-5, and that of the Leeward Islands from 1895 to 1901.

Melville, George Wallace, American naval engineer: b. New York city 10 Jan. 1841. He was educated at the Brooklyn Polytechnic Institute; entered the navy as assistant engineer in 1861; served through the War; and in 1879 accompanied the De Long expedition on the Jeannette to discover the northeast passage. Of this party he was one of the few survivors; most of the others owed their lives to his indomitable courage and herculean strength—he carried a brother officer, weighing 175 pounds, upon his back, through ice and snow, at the same time

superintending all movements of the crew and on occasion helping with the boat. He also commanded the subsequent search expeditions which recovered the Jeannette's records and De Long's body. In 1887 he was made chief engineer of the navy, a post from which he retired in August 1903, having entirely reformed the service, put navy engineers on a professional rather than an artisan footing, introduced the triple screw on such successful ships as the Columbia and Minneapolis, saved the department a tremendous sum by his refusal to adopt a boiler which had proved unsatisfactory in the British navy, and designed 120 ships of over 700,000 horse-power. Melville was made rear-admiral in 1899. His book, 'In the Lena Delta' (1885), describes his experiences in the Jeannette expedition.

Melville, Herman, American naval novelist: b. New York 1 Aug. 1819; d. there 28 Sept. 1891. His grandfather was the original of Holmes' 'Last Leaf.' His father, an importing merchant, died when Herman was a boy, and in 1837 his education in the Albany Classical School and in New York city having been completed, he shipped as a cabin boy. Then he taught school for several years, but in 1841 sailed on a New Bedford whaler, from which in 1842 he made his escape with a comrade on one of the Marquesas. His experiences among the warlike natives and his rescue by an Australian whaler are described in 'Typee, a Peep at Polynesian Life' (1846), a great success and an excellent portrayal of life in the South Seas. In 1847 he married the daughter of Justice Lemuel Shaw of Massachusetts; from 1850 to 1863 lived in Pittsfield; was employed in the New York custom-house from 1866 to 1885; and then retired because of ill-health. Melville's writings apart from a few small volumes of verse are mostly taken up with the life of the sailor; some of his better known titles are: 'Omoo, Adventures in the South Seas' (1847); 'White Jacket, or the World in a Man-of-War' (1850), which effected the abolition of flogging in the United States navy; 'Moby Dick, or the White Whale' (1851); and 'Pierre, or the Ambiguities' (1852). These stories were justly popular and are highly praised by W. Clark Russell (q.v.). Several 'philosophical romances' met with little success. 'Battle Pieces, and Aspects of the War' (1866) is Melville's best verse. His four best romances of the sea were re-edited in 1892.

Melville Island, (1) an island of the Arctic regions crossed by lat. 75° N., lon. 110° W., and separated on the west by Fitzwilliam Strait from Prince Patrick Island. Its greatest length is 200 miles; greatest breadth 130 miles. It was discovered in 1819 by Parry, who gave the island its name and wintered there; (2) an island at the entrance to Van Diemen Gulf, off the shore of the north territory of South Australia, with an area of about 1,800 square miles. It is hilly and densely wooded, especially with several species of eucalyptus. The earliest British settlement was made in 1824.

Melville Peninsula, North America, a northeastern projection of Keewatin, bounded on the north by Fury and Hecla Strait, and on the east by Fox Channel. It is about 250 miles long by about 100 miles broad.

Melville Sound, North America, a channel about 250 miles long by 200 miles broad, extend-

ing southeast of Melville Island, and communicating with the Arctic Ocean on the west by Banks' Strait, and with Baffin Bay on the east by Barrow Strait and Lancaster Sound.

Mem'brane, in anatomy and physiology, a thin sheet-like tissue, more or less elastic, varying in structure and vital properties. Membranes absorb or secrete fluids, connect certain parts of the body, separate, envelop, or form certain organs, or act as partitions between two fluids or gases, permitting them to mingle. Mucous membranes line the canals, cavities, and hollow organs which communicate externally by different apertures on the skin; for example, the digestive, respiratory, and genito-urinary tracts. These membranes are soft and velvety, and have on their free surface cells for absorption or motion, and in their substance follicles which secrete mucus for lubricating purposes. Serous membranes, such as the peritoneum, pleura, and pericardium, facilitate the motion of the organs they envelop (abdominal digestive organs, the lungs and heart) by reason of the serum they secrete, and also maintain the shape of these organs. Allied to the serous membranes are the synovial membranes lining movable joints. By reason of their smoothness and by the aid of their lubricating serum the ends of bones move readily upon one another. Fibrous membranes (for example, periosteum, dura mater, and perimyrium), not moistened by any particular fluid, augment the solidity of organs they envelop, retain them in position, favor their motion, and form canals and rings for the passage of different organs.

Membré, mǝn-brā, **Zenobius**, French missionary in America; b. Bapaume, France, 1645; d. Fort St. Louis, Texas, 1687. He became a member of the Récollet Order; was sent as a missionary to Canada in 1675; accompanied La Salle in his western expedition; was with Tonti at Crèvecoeur, where he helped bring about peace between the Iroquois and the Illinois; in 1682 went down the Mississippi with LaSalle; and in the same year returned to France. For a time he was warden of a convent in his birthplace. But in 1684 he set out again with La Salle for the mouth of the Mississippi. He was left by LaSalle at Fort St. Louis and there massacred by the Indians. He wrote a description of his trip down the Mississippi, which was incorporated by his cousin Christian Le Clerq into his 'Établissement de la Foi dans la Nouvelle France' (1691), and which was later unscrupulously copied by Hennepin (q.v.). This narrative has sometimes been attributed to LaSalle.

Memel, mā'mēl, Germany, an important fortified seaport of Prussia, near the Russian frontier, at the north extremity of the Kurisches Haff, at its opening into the Baltic, 70 miles northeast of Dantzic. It was almost wholly destroyed by fire in 1854, and was rebuilt in modern style. It has a large harbor, and exports from Lithuania and Russia timber, flax and linseed, coal, manure, grain, and herrings; has also manufactures of brandy, soap and chemicals, sawmills, iron foundries, breweries, and ship-building yards. Memel was founded in 1252 by the Livonian order, who gave it to the Teutonic Knights, by whom it was fortified in 1404. It suffered severely in the Lithuanian wars (13th to 15th centuries). Here in 1807 Frederick Wil-

liam III. of Prussia took refuge, and a treaty with England was signed. Pop. (1900) 20,174.

Mem'ling, or **Memlinc**, **Hans**, Flemish painter; b. Mainz 1430; d. Bruges 1495. He settled at Bruges 1478, of which town he was a prosperous citizen until his death. While all that is handed down of his biography is apocryphal, it is evident, from his works, that he was an imitator of Roger Van der Weyden, although he avoided the harshness and ungraceful drawing of that artist's style. He stood alone among the Flemish painters of his day in the religious tenderness of his pictures, their life-like expression, their exquisite coloring and modeling. His chief works are to be found in St. John's hospital, Bruges, namely, the altarpiece 'Marriage of St. Catharine' (1479); 'Portrait of Maria Moreel as Sybilla Persica' (1480); and the 14 scenes illustrating the legend of St. Ursula and the 11,000 Virgins of Cologne (1589). In the Academy of Bruges is a triptych of his in the central panel of which are Saints Christopher, Maurus and Ægidius, and on the wings, Burgomaster Moreel (who offered the picture) with his family. In the Royal Gallery at Turin is his 'Seven Dolors of Mary'—a passion picture; in the Pinakothek at Munich a companion picture, 'The Seven Joys of Mary.' Consult, Michiels, 'Memlinc, sa Vie et ses Œuvres' (1883); Wauters, 'Sept Etudes pour Servir à l'Histoire de Hans Memlinc' (1894).

Memmi, mēm'mē, **Simone**. See MARTINI, SIMONE.

Memminger, mēm'mīn-jēr, **Christopher Gustavus**, American politician, secretary of treasury in the Confederate government; b. Württemberg, Germany, 17 Jan. 1803; d. 7 March 1888. He was brought to America in infancy, and was educated at South Carolina College. He studied law; began to practise in Charleston in 1825; entered politics as a leader of the Union party, attacked the States' Rights party in a satire called 'The Book of Nullification' (1832); reformed the public school system of the State; and for 20 years was in the State legislature, much of the time acting as head of the finance committee. In 1859, after John Brown's raid, he was commissioned by South Carolina to consult with other delegates in Virginia as to the best method of warding off attacks of Abolitionists. From the formation of the Confederacy until June 1864 he was secretary of treasury; and his mistaken policy in that office did much to ruin the Confederacy financially.

Mem'non, in Greek mythology, the son of Eos (Dawn), an Ethiopian prince, nephew of Priam, for whom he fought at Troy. After he had killed Antiochus he was defeated by Achilles. The post-Homeric legend adds that his mother wept bitterly for him, even after he had been made immortal. Memnon's kingdom was localized on the west bank of the Nile, and one of the colossal statues of Amenhotep III. as early as the 1st century A.D. became connected with the myth. It was said to portray Memnon, and the musical note emitted when the sun's rays struck the statue in the early morning (probably due to the action of sudden heat on the chilled damp stone) were explained as Memnon's greeting to his mother. The statue, rehabilitated by Severus, is no longer sonorous. The name Memnonium was applied in the Ptolemaic period not

MEMNONIUM—MEMORY

only to the west bank of the Nile, as "Memnon's land," but to a temple near Abydos, excavated by Mariette in 1859, which contains the famous "gallery of kings." This has a list of 76 Egyptian kings, and dates from the time of Seti I. and his son Rameses II. This Memnonium contains many other important sculptured documents.

Memnon'ium. See MEMNON.

Memorial Arch, an arch usually built across an avenue or street, or at an entrance to a park, garden or other public place, to commemorate some person or event. The Washington Arch in Washington Square, New York city, is a well-known American example of the memorial arch. It is built of marble and is adorned with elaborately carved figures.

Memorial Day. See DECORATION DAY.

Memory and its Disorders. Locke has defined memory as "the power the mind has to revive perceptions which it once had, with the additional perception that it has had them before." Ribot summarizes three ideas as constituting memory: (1) the preservation of certain states; (2) their reproduction; and (3) their recognition; and apart from metaphysical quibbles and niceties this is the common-sense view of memory. The Hamiltonian distinctions between recollection and memory are of little practical import; but the differences between memory and imagination are fundamental. Certain memories may be said to be subconscious, so that the third part of Ribot's definition and the additional perception of Locke may need a certain degree of extension. It is now clearly recognized that the collections of gray matter in the cerebrospinal axis below the cortex may be capable of storing impressions, and it is even thought by many that all parts of the sensory nervous system may be said to be concerned in mind-action and in memory. It is largely a question of terminology whether or not consciousness of previous experience should determine what we call memory. If so, then so-called subconscious memories need another term, and the whole subject-matter of memory in hypnotic and allied states is in need of thorough overhauling. From a purely mechanical point of view memory is interpretable as a result of a biochemical phenomenon. The sensory nerve-cells, being acted on by certain stimuli, whether of touch, taste, hearing, or sight, undergo certain molecular changes. Repetition of similar impulses induces similar reactions and a habitual response in the affected cells results. A line of least resistance is established, and in these habitual responses the germ of the idea of memory is to be found. From this point of view the nerve-cells retain something as a result of a previous experience, and the repetition of the stimulus finds the cells in a receptive state. Continued repetition of the stimuli constitutes a memory, and in this sense the training of a certain mechanism has bound up in it this mechanical theory of memory. Thus a muscular effort, as in tennis, or skating, or piano-playing, becomes by repetition remembered in automatic action, it may be without consciousness. It very frequently happens, in fact it is the usual rule, that many muscular acts which in their acquisition have called for conscious memories soon become automatic, and the effort no longer rises into consciousness, perhaps be-

cause of its diminished intensity. A similar point of view may be held for sound-impressions, for taste, for touch, for sight, in each individual case a different series of nerve-cells and nerve-fibres being involved. Thus the memory for a poem may mean a habit-response to a series of sight or sound impressions, or of the muscular memories of the speech mechanism that has learned to repeat the phrases. The actor who automatically says his lines, often not conscious of what he is saying, the pianist who mechanically plays, or the golfer who unconsciously drives true, all show the same class of memory adaptations, involving different nervous chains.

Memory, however, does not depend on repetition of stimulus alone. There are variations in intensity and duration of stimuli, modifications in plasticity of the nerve-cells themselves, the quality of attention, and above all the native individual character of health of the nerve-tissue itself—all of which factors enter into the everyday variations in memory that are familiar to all. The fixity and enduring quality of the memories of childhood are proverbial, and are due to the great plasticity of the youthful nerve-cells, as well as to the intensity of the early pictures. That one person should have a good visual memory and a poor auditory memory, and *vice versa*, must naturally be interpreted as due to variations in individual capacity. Modern pedagogy has slowly recognized these variations, and the greater prominence given to play, and to methods of precision, be they manual, lingual, auditorial, or visual, and less to distinctly formal methods of memorizing as a purely visual process from a printed page, may be regarded as evidence of this wider recognition that memory should be a generalized function, and not a pedantic cramming of any sort. A well-trained muscular system may be of far greater use to a man than any of his acquired knowledge. It is impossible to train certain children to do certain things, whereas in other directions training may result in great proficiency.

Disorders of Memory.—The disorders of memory fall into two classes, those of excess and those of defect. The general term for deficiency or loss of memory is amnesia, although this term fails to express the various distortions of memory, the illusions, or slight absences; and there are no technical words to distinguish temporary or permanent, periodic or progressive stages of the amnesic process. Inasmuch as memory is not one thing, but a great assemblage of processes which reflect a vast variety of psychological functions, situated not in the brain alone, but almost anywhere in the nervous system, a "defect in memory," as defined by Jastrow, "is an expression of the incapacity of a group (or of certain groups) of centres to exercise their normal functions; or a tendency which they show to functionate in an abnormal manner." Defects of memory may be general or special. General defects may be due to an incapacity on the part of nervous centres to establish residua. This type is found in those people who never remember what they see, and, notwithstanding frequent repetition of an act, never acquire proficiency in it. Occasionally a reverse general condition is manifest wherein the power of memory is unduly exalted and impressions of past experience reappear with unusual brilliancy. Such states are known in

MEMPHIS

fevers, in intoxications of various kinds, alcohol, opium, etc., the hypnotic trance. Special defects may arise in which particular isolated experiences are cut out of the mind. Thus alcoholic amnesia, that may forget even a committed crime, is an illustration. Somnambulism and other hysterical states are characterized by defects of this special type. Another form of defect is observed when associated memory-groups are blotted out, as in the special disorder aphasia. (See APHASIA; SPEECH AND ITS DEFECTS.) Memory may be falsely localized in time, or in order; imaginary additions to real events may be present; or illusory remembrances of what has never been experienced occur.

Psychologically considered, memory defects may occur either in the storing or retentive part of the nerve-cells, or they may involve the much more complicated and associated process of reproduction of the retained images. Both processes may be involved at the same time. In imbecility, idiocy, dementia, etc., a born or acquired loss of retentive power is present. In pianists—for example, Paderewski—or chess-players—Morphy, Pillsbury, etc., a state of localized hypermnnesia is present. This group would include all such prodigies. Occasionally one sees these two groups represented in one individual, as in an imbecile who has great power for mathematical calculation, etc. A case of this kind proves that the old assumption of closely localized memory-centres is false. Memory may be said to reside in all parts of the sensory nervous system. In another group the ordinary amnesias may be placed. These vary with each individual and depend largely on the healthy tone of the nervous system. A third group would include the paramnesias, or illusions of memory: (1) those of simple nature, involving a loss of distinction between imagination and real memory, a condition which is almost universal and in its exaggerated phases is seen in "constitutional liars," many types of the insane being afflicted with this inability to distinguish; (2) double memory (identifying paramnesia), a very common form of memory-illusion, in which the thought of having seen, heard or felt "just that same thing before" is present; in some insanities this double memory being very prominent and often making "prophets"; (3) associated paramnesia, in which things actually experienced suggest false memories of things not experienced; this condition being seen in children, and often leading to false testimony. In this last class most of the "presentiments," or antecedent knowledge of what has happened, may be grouped. It is largely on the basis of these suggested memories that faith-healing heals ills that really never existed save as suggested false memories. On these pseudo-reminscences much of the fabric of spiritualism, second sight, and similar phenomena, is reared. See IDIOCY; PERSONALITY; SPEECH DISORDERS; AND RETENTIVENESS.

Consult: Baldwin, 'Dictionary of Psychology and Philosophy'; Ribot, 'Diseases of Memory'; Guillon, 'Les Maladies de la Mémoire,' with full consideration of hypermnnesia (1897); Sallier, 'Troubles de la Mémoire' (1892); and Pardo, 'I disturbi della memoria' (1899).

SMITH ELY JELLIFFE, M.D.,

Managing Editor *Journal of Nervous and Mental Disease.*

Memphis, mēm'fīs, Egypt, an ancient city near the apex of the Nile Delta, 12 miles south of Cairo, according to Herodotus, founded by Menes, the first king of Egypt. It was a large, rich, and splendid city, and the second capital of Egypt. After the fall of Thebes it became the sole capital. Among its buildings the temples of Phtha, Osiris, Serapis, etc., and its palaces were described as remarkable. At the time of the conquest of Egypt by Cambysses (524 B.C.) it was the chief commercial centre of the country, and was connected by canals with the Lakes of Mœris and Mareotis. With the rise of Alexandria the importance of Memphis declined, and it was finally destroyed by the Arabs in the 7th century. In Strabo's time (20 A.D.) it was, in population and size, next to Alexandria; in biblical history it is mentioned as Moph and Noph. The name Memphis is a corruption of Men-nofer "good abode." Edrisi, in the 12th century, describes its remains as extant in his time. Among the works specified by him are a monolithic temple of granite 13½ feet high, 12 long, and 7 broad, entirely covered within and without with inscriptions, and statues of great beauty and dimensions, one of which was 45 feet high, of a single block of red granite. These ruins then extended about 9 miles in every direction, but the destruction has since been so great, chiefly for the construction of Fostat, an Arabic city on the opposite bank of the Nile, that although Pococke and Bruce fixed upon the village of Mitraneh as the site (where prone on a mound are two colossal statues of Rameses II.), this was not accurately ascertained until the French expedition to Egypt, when the discoveries of numerous heaps of rubbish, of blocks of granite covered with hieroglyphics and sculpture, and of colossal fragments scattered over a space of three leagues in circumference, decided the point.

Memphis, Mo., city, county-seat of Scotland County; on the Keokuk & Western railroad; about 160 miles north by west of Saint Louis. It is in an agricultural region, and is the trade centre for a large part of Scotland and adjacent counties. The principal out-going shipments are farm products and live-stock. There are bituminous coal fields in the vicinity. Pop. (1890) 1,780; (1900) 2,195.

Memphis, Tenn., city, county-seat of Shelby County; on the Mississippi River, at the head of all-the-year-round navigation; on the Illinois Central, the Louisville & Nashville, the Yazoo & Mississippi Valley, the Kansas City, Memphis & Birmingham, the Saint Louis & San Francisco, the Choctaw, Oklahoma & Gulf, the Saint Louis, Iron Mountain & Southern, the Rock Island & Pacific, the Nashville, Chattanooga & Saint Louis, the Saint Louis & South-western, the Chicago, Saint Louis & New Orleans, the Southern, the Memphis & Gulf, the Mobile, Jackson & Kansas City, and the Union R.R.'s. It has steamer connection with all the river and Gulf ports; 26 steamers call Memphis landing home. It is about 820 miles above New Orleans and 450 miles below Saint Louis. It is the largest city in Tennessee, the fifth in size of the cities on the Mississippi River, and the most important place between New Orleans and Saint Louis. It is noted for its extensive trade in cotton and cottonseed products and in hardwood lumber. It has the only bridge (1903) spanning the Mississippi River south of Saint

MEMPHIS

Louis. This is a steel cantilever bridge, 1,895 feet in length, costing \$3,000,000, and opened to the public 12 May 1892.

Prior to 1880, Memphis was visited frequently by yellow fever, and in 1878 and 1879, passed through two terrible epidemics, losing about 5,000 of her population by death, and many thousand people left the city. This proved to be the turning point in her career, and since then, 210 miles of automatic, flush-tank, Waring system of sewers have been put in. The water supply of the city is obtained from 64 artesian wells, the average depth of which is about 400 feet. The present pumping capacity of the water supply is 30,000,000 gallons per day, and the daily consumption is 15,000,000 gallons. Among the cities of the United States with a population of 100,000 or over, Memphis ranks second in general healthfulness. The death rate is 12.75.

The city is well laid out and well built. The wide, well-shaded and well-paved streets, the fine public and private buildings, the parks with numerous large trees, all make the city most attractive. The combined park area is about 1,000 acres, besides two fine race tracks. The streets are paved with asphalt, vitrified brick, macadam, and gravel. About 250 miles of turnpike radiate from Memphis. Among the 850 industrial establishments are 11 cottonseed-oil mills, seven ice factories, seven grain elevators, 35 wholesale grocery houses, seven wholesale dry goods houses, seven wholesale drug houses, furniture factories, wood-working establishments of all kinds, foundries, machine shops, flour mills, pulp and paper mills, fibre plants, saddlery and harness factories, potteries, car works, pump works, wagon and carriage shops, cracker and candy factories, patent medicine works, sugar plantation machinery works, barrel and skewer factories, spoke factories, golf stick works, shuttle block works, trunk, screen door, and window factories, basket and box factories, egg case works, horse collar factories, engine and boiler works, refrigerator and cold storage machinery works, cotton gins, stove and range factories, handle and coffin factories, shaft and pole works, cider presses, distilleries, and breweries.

Among the prominent buildings are 123 churches, 65 schools and colleges, three public libraries, three first-class theatres, the custom-house, cotton exchange, Odd Fellows' building, Porter, Scimitar, and Equitable buildings, Masonic Temple, Gayoso Hotel, Woman's building, Randolph building, Goodwyn Institute, Memphis Trust building, Tennessee Trust building, a number of fine hotels, three large hospitals, and two orphan asylums. Memphis has a number of educational institutions, good public and parish and many private schools, the Memphis Hospital Medical College, the Maddox school for young women, the College of the Christian Brothers (R. C.), founded in 1871; Saint Agnes' Academy (R. C.), Sacred Heart Institute (R. C.), Saint Mary's School (P. E.), University School, and two public high schools. The Hannibal Medical College and the Le Moyne Normal Institute are for colored pupils. Five miles distant from the city is a National Cemetery, which contains 14,039 graves, of which 8,822 are those of unknown dead.

The annual expenditures for maintenance and operation are about \$1,000,000. The combined

capital and surplus of the 17 banks and three trust companies are \$6,000,000; the deposits \$25,000,000. The building permits issued in 1902 were valued at \$2,532,000. The progress the city is making at the present time is almost phenomenal. The growth of Memphis during the decade from 1890 to 1900 was greater than in any former decade of its existence. The population increased nearly 50 per cent. In 1890 the city had 250 industrial establishments, in 1900 more than 650, and 850 in 1903. Memphis is often spoken of as not only the metropolis of Tennessee, but also of Arkansas and Mississippi; the city is located in such a position as to be a great trading centre for each of these States.

The history of Memphis begins almost with the history of the United States. It was a landing and tenting place for the early explorers and missionaries. It was the home of the Chickasaw Indians, and the bluffs on which the city is located, 40 feet above high water and 80 feet above low water, have always been known as the Chickasaw Bluffs. In 1698 the French built forts on the site of what is now the city, and in 1794, the Spaniards erected forts at a time when Spain was claiming exclusive rights to lower Mississippi. Some of the foremost men in the United States owned lands in this vicinity and were interested in holding for their own country a right to free navigation on the Mississippi to the Gulf. Andrew Jackson, James Winchester, and John Overton sent to Memphis, in 1819, a small colony who established the first permanent settlement. In 1826 there were 500 persons in the settlement which was then incorporated as a town, and in 1849 a city charter was granted. The Union and Confederate forces tried to gain possession of the city at the beginning of the Civil War. On 6 June 1862 a Federal fleet under Commodore Davis conquered a Confederate fleet under Commodore Montgomery, thus placing Memphis in possession of the Union forces. General Forrest in command of Confederate forces entered the city in August 1864 and took several hundred prisoners.

Memphis has always progressed commercially except during the Civil War, and when visited by the yellow fever epidemics. The great growth industrially has come within the last few years. The location is making the city a great railroad centre; the surrounding forests are making it a great industrial centre; and the alluvial lands of the Saint Francis Basin, Yazoo Delta, and the Valley of the Mississippi River will always make her a great commercial centre. In 1855 yellow fever attacked the city, and again in 1867, 1873, 1878, and 1879. The epidemics of 1878 and 1879 so paralyzed the industries of the city, that in 1879 Memphis was unable to liquidate the current indebtedness and the charter as a city was revoked. The former city was designated by the State Legislature as "the taxing district of Shelby County." The control of the district was vested in a board of public works composed of five members, and a governing council composed of three commissioners. The council instituted the sewerage improvements, liquidated the debts, and in 1891 the place was reincorporated and again chartered as a city. Memphis lost lives, property, trade, and credit; but the history of the deeds of heroism performed by many during the fear-

ful yellow fever epidemic overshadows in importance the history of financial difficulties.

Since the Federal census of 1890, the city limits have been extended; but the population as given in 1890 included both urban and suburban districts, and the increase from 1890 to 1900 was remarkable. The growth of the city may be seen from the Federal census reports. Pop. (1850) 8,841; (1860) 22,623; (1870) 40,226; (1880) 33,592; (1890) 64,495; (1900) 102,320. In 1900 less than 5 per cent were foreign born, and nearly 50,000 were of negro descent. The city directory for 1903 gives the population at 159,326.

Consult: Davis, 'History of the City of Memphis' (1873); Keating and Vedder, 'History of the City of Memphis' (1888).

I. F. PETERS,

Commissioner Industrial League, Memphis, Tenn.

Memphis (Tenn.), Capture of. At dusk 5 June 1862 the Union flotilla under command of Com. C. H. Davis appeared near Memphis and anchored two miles above the city. The Confederate flotilla, Com. J. E. Montgomery, commanding, was lying at the Memphis levee. At daylight the Union fleet began to drop down toward the city, and the Confederates advanced to meet it. There were no troops protecting the city. The flotillas were composed of the following vessels:

UNION	Guns	CONFEDERATE	Guns
Benton	16	Little Rebel	2
Louisville	13	Bragg	3
Carondelet	13	Beauregard	4
Cairo	13	Price	4
St. Louis	13	Sumter	3
Queen of the West	ram	Lovell	4
Switzerland	ram	Thompson	4
Monarch	ram	Van Dorn	4
Lancaster	ram		
	68		28

Besides having more than twice the number of guns, the Union ordnance was much superior to that of the Confederates. The latter, however, made a desperate fight, which finally ended ten miles below the city, with the result that the Lovell, Beauregard and Thompson were destroyed; and the Little Rebel, Price, Sumter, and Bragg captured. The Van Dorn escaped. On the Union side only the Queen of the West was disabled.

Immediately after the fight the mayor, in reply to a summons to surrender, informed Com. Davis that there were no troops with which to oppose him. The next morning detachments from troops under Col. G. N. Fitch, which accompanied the fleet, landed and took possession of the city.

Gen. Grant arrived at Memphis 23 June, and established the headquarters of the District of West Tennessee. He was recalled to Corinth 15 July, and Gen. Sherman was ordered to Memphis, reaching the city 21 July. He restored the mayor and the city government, and made them responsible for civil order. He continued in command at Memphis until his forces left to join Gen. Grant in the final campaign for Vicksburg, having previously participated in the first move against that city.

The raid of Gen. N. B. Forrest, of Confederate cavalry fame, into Memphis occurred 21 Aug. 1864. The Union forces and commanding officers were completely surprised, and barely escaped capture. Gen. C. C. Washburn, in com-

mand of the District of West Tennessee; Gen. R. P. Buckland of the District of Memphis, and Gen. S. A. Hurlbut, were asleep in the city. Gen. Forrest left the vicinity of Oxtord 18 August, with three brigades, making a forced march of nearly 100 miles. A strong detachment rode into the city at 4 o'clock in the morning, running over a regiment of 100-days men on picket, and capturing about 250 of them. This force divided into three, and at once surrounded the quarters of the three officers named. Each, however, escaped, Gen. Buckland succeeded in reaching his troops and promptly directing offensive operations. With the exception of inconsiderable skirmishes in its vicinity, Memphis thereafter remained in undisturbed Union control.

H. V. BOYNTON.

Memphremagog, mēm-frē-mā'gōg, a lake in the southern part of the province of Quebec, Canada, extending into Orleans County, in Vermont. It is about 32 miles long, north and south, and from three quarters of a mile to four miles wide. It is irregular in shape, and along its shores are several striking indentations, in some places low and in some other parts high and rocky. The land on the west shore is mountainous, the altitude of the highest points being about 2,800 feet. The outlet is the Magog River, which flows into the Saint Francis river. Along the shore are a number of villages, and in summer a steamer plies daily on the lake, connecting the chief towns and villages.

Mena, Juan de, Spanish poet: b. Cordova, Spain, about 1411; d. 1456. He was educated at Salamanca and at Rome and afterward was appointed secretary and court historian to John II., King of Castile. His allegorical poems, 'Coplas de los Siete Pecados Mortales,' ('Le Coronacion,' and 'El Laberinto' (The Labyrinth), a poem founded on the 'Divina Commedia' and published in the year 1496, all show the influence of Dante, for whom he held great respect and admiration. They were very popular, but possessed little literary merit. His collected works were published in 1528, entitled 'Copilación de todas las obras de Juan de Mena.'

Menabrea, Luigi Federigo, COUNT, Italian soldier and statesman: b. Chambéry, in Savoy, 4 Sept. 1809; d. there 25 May 1896. After completing a course in mathematics at the University of Turin and joining the engineers in the Sardinian army, he accepted the professorship of technical science at the military academy and at the University of Turin. Having been promoted to the rank of captain, he was used in the diplomatic corps for some time; was then elected deputy, serving both under the minister of war and the minister of the interior; and upon the outbreak of the war of Sardinia and France against Austria in 1859 he was appointed chief of the engineer corps. After Savoy was ceded to France, Menabrea was made a senator by Victor Emmanuel, and chief of the department of engineers, and as such planned the fortifications of Bologna, Piacenza, and Pavia; in 1860 he was created a lieutenant-general, in that year laying siege to and after three months of fighting taking Gaeta. In 1861 he joined the cabinet of Ricasoli as minister of marine, in 1862 also taking over the portfolio of minister of public works. In 1866 he was Italian

ambassador to the council which brought about the Treaty of Prague and ceded Venice to Italy. In 1867, when Rattazzi resigned, he formed a new ministry, himself becoming minister of foreign affairs. As premier he did much to place Italy in cordial relations with the outside world, and to settle internal dissensions, but his imprisonment of Garibaldi, and the prevalent financial straits of the nation lost to him the confidence of the House of Deputies, and on 16 Nov. 1869 he resigned. In 1870 he became Italian ambassador at Vienna, was appointed to the same post at London in 1876, and in 1882 went to Paris, where he was stationed for 10 years. The most important of his works are: 'Etudes sur la série de Lagrange' (Turin 1844-7); 'Le génie italien dans la campagne d'Ancone et de la Basse-Italie' (Paris 1866); and 'République et Monarchie dans l'état actuel de la France' (1871).

Menage, Gilles, French philologist and satirist: b. Angers 15 Aug. 1613; d. Paris 23 July 1692. After completing his early studies he became an advocate, practising for some time at Paris, but, having conceived a profound disgust for that profession and all its adherents, he became an ecclesiastic, and for some time was a member of the household of the Cardinal de Retz, but subsequently took up his residence in the cloister of Notre Dame. A witty satire, entitled 'Requête des Dictionnaires', published shortly after this time and aimed at the 'Dictionary' of the French Academy, prevented his becoming a member of that society. His most important works are: 'Dictionnaire étymologique, ou Origines de la Langue Française' (1650-94); 'Origines de la Langue Italienne' (1669); 'Miscellanea'; 'Remarques sur la Langue Française'; 'Historia Mulierum Philosophorum'; 'Poesies Latines, Italiennes, Grecques, et Françaises'; and 'Anti-Baillet.'

Menagerie, a collection of wild animals, exhibited in zoological gardens, in museums, and by circus companies traveling from city to city. See CIRCUS; ZOOLOGICAL GARDENS.

Menai (mē'nī)-Strait, the channel between Wales and the island of Anglesey, is 13 miles long, and varies in width from 250 yards to two miles. A suspension bridge and the celebrated Britannia Tubular Bridge connect Anglesey with the mainland. See BRIDGES.

Menam, mā-nām', or **Meinam**, the chief river of Siam, rising in the Laos country, and flowing generally southward to enter the Gulf of Siam below Bangkok. Its length is about 900 miles, and for a considerable portion of its course it is navigable for small craft. It is subject to periodical overflows on which the crops of the rice fields along its banks are dependent.

Menander, the name of two Greek writers, (1) the comic dramatist: b. Athens, 342 B.C.; d. there 290 B.C. He was the pupil of Theophrastus, himself the pupil and successor of Aristotle as head of the Peripatetics, and author of 'Characteres,' a somewhat more literary and popular enlargement of some ruling ideas of the Nicomachean Ethics; he was by such a teacher well trained for his dramatic vocation. He was, moreover, a friend of Epicurus from early life, and may thus have been imbued with that bonhomie which rendered him so genial an interpreter of manners. He wrote a hun-

dred comedies which are distinguished from those of Aristophanes by their refinement, their freedom from personal and political virulence, and their graceful, sometimes beautiful, delineation of feminine character. He was, however, outrivalled in popular favor by his contemporary Philemon, whose ribaldry was irresistible to the Athenian playgoers. Only some fragments of his works survive in the original, the most important of these relics having come to light in Egypt (1898). He was, however, closely imitated by Plautus and Terence, and in the 'Bacchides,' 'Stichus,' and 'Poenulus' of the former, and the 'Andria,' 'Eunuchus,' 'Heautontimorumenos,' and 'Adelphi' of the latter we have very good representatives of the Greek dramatist's method and spirit. A fine antique statue of Menander is to be seen in the Vatican. (2) A Greek rhetorician who flourished in the latter half of the 3d century B.C. He has left the rhetorical treatise 'De Encomiis,' and from his analyses of the orations of Demosthenes, most of the scholia on that orator have been compiled. Consult: (on Menander the dramatist), Guizot, 'Ménandre' (1855); Horkel, 'Lebensweisheit des Komikers Menander' (1857); (on Menander the rhetorician), Ritschl, 'Der Rhetor Menander und die Scholien zu Demosthenes' (1883).

Menant, Joachim, French Assyriologist and jurist: b. Cherbourg 16 April 1820; d. Paris 30 Aug. 1899. Having studied law he was appointed to the magistracy of the civic tribunal in the city of Havre, but soon turned his attention to deciphering the old Assyrian inscriptions, for which he was elected a member of the Académie des Inscriptions. Chief among his works are: 'Zoroastre' (1844); 'Recueil d'Alphabets des Écritures cunéiformes' (1860); 'Éléments d'Épigraphie assyrienne' (1860); 'Inscriptions assyriennes des briques de Babylone' (1860); 'Inscriptions de Hammourabi, roi de Babylone au XVI. siècle avant notre ère' (1863); 'Exposé des Éléments de la Grammaire Assyrienne' (1868); 'Leçons d'épigraphie assyrienne professées aux livres de la Sorbonne' (1873); a collection of texts, 'Annales des rois d'Assyrie' (1874), and 'Babylone et la Chaldée' (1875); 'Manuel de la langue assyrienne' (1880).

Ménard, mā-nār, Michel Branamour, American pioneer: b. Laprairie, Lower Canada, 1805; d. 1856. He was of French parentage, and after working some time for a Detroit fur-trading company entered the service of his uncle, also a fur-trader, in Missouri. The Shawnees made him their chief, and he acquired great power among various Indian tribes. Soon after 1830 he went to Texas, where he continued fur-trading with the Indians, and also dealt with Mexicans. When the Texans revolted against Mexico he held the Indians in check and kept them from acting against the insurgents. As a member of the convention at which the Texans declared their independence, and afterward of the Congress of Texas, he exerted an influence in the formation of that State. The greater part of the site of Galveston was included in a purchase made by him in 1836, and of that city he, more than any other man, is to be considered the founder.

Menasha, mē-nāsh'a, Wis., city, in Winnebago County; at the mouth of the Fox River, on

Lake Winnebago, on the Government Canal of the Fox and Wisconsin River Improvement Company, and on the Chicago, M. & St. P., the Wisconsin C., and the Chicago & N. W. R.R.'s, about 90 miles north by west of Milwaukee. The first permanent settlement was made in 1847 and the incorporation was in 1874. Menasha, like other places on Lake Winnebago, is a favorite summer resort. It is in an agricultural region in which the lumber interests are prominent. The chief manufactures are flour, lumber, paper, brick, machine-shop products, woodenware, furniture, and woolen goods. The city has good public and parish schools, and a public library. Pop. (1890) 4,581; (1900) 5,589.

Menasse, mā-nās'ā, **Ben Israel**, Jewish scholar and writer: b. Lisbon 1604; d. Middelburg 20 Nov. 1657. He was in his 18th year rabbi of a synagogue in Amsterdam; mastered 10 languages, and published numerous works on theology and hermeneutics. After the decapitation of Charles I. of England, he took measures to secure a repeal of the statute of Edward I., by which Jews were excluded from England. Cromwell appointed a commission to consider his petition, and in 1655 the legal restrictions were removed. Among his most notable works is 'Vindiciae Judeorum,' which was translated into German by Mendelssohn, 1782. Consult Kayserling, 'Menasse Ben Israel' (1861).

Mencius, mēn'shī-ūs, the Latinized name of Meng-tse, that is, Meng the Teacher, a Chinese philosopher and recluse: b. Province of Shan-Tung about 372 B.C.; d. there about 289 B.C. He was educated by his mother with such success that the approbation contained in the phrase "the mother of Meng" has become proverbial. Mencius was one of the greatest of the early Confucians. During his time the governments of China were oppressive, and Mencius for many years wandered about in search of a prince who would consent to govern in accordance with true and just principles. Failing to find any such, he retired to his former seclusion and spent the rest of his life in perfecting his system and training up disciples. His works contain some enlightened views on man and society. He believed in the moral nature of man and had unbounded faith in the possibilities of progress under a good social and political system. He regarded all governments as from God, but at the same time he believed in the responsibility of rulers to their people and the people's right to depose or even put to death unworthy rulers. In a nation the people are the most important element, second comes the government, and third the monarch. The aim of a government, according to him, should be the happiness and education of the people, and any ruler who was content to leave his subjects in ignorance and misery deserved to be deposed. The teachings of Mencius were written out by his disciples in dialogue form, under the title 'The Book of Mencius,' which has been translated into Latin by Julien (1824) and into English by Collin (1828). Consult: Legge, 'Life and Works of Mencius' (1875); Faber, 'Lehrbegriff des Philosophen Mencius' (1877); Waters, 'A Guide to the Tablets in a Temple of Confucius' (1879).

Mende'ans. See NAZAREANS.

Mendel, Johann Gregor, abbot of Brunn, now known as the discoverer of the law named after him (see HEREDITY): b. Heinzendorf bei Adrau, Austrian Silesia, 22 July 1822, of peasant parents; d. 6 Jan. 1884. In 1843 he entered the Königskloster, an Augustinian foundation in Althbrunn, as a novice; and was ordained priest in 1847. From 1851-3 he studied natural science at Vienna; and, on his return to the cloister, taught in the Realschule. About 1869 he became abbot of Brunn; and later took part in the Ultramontane movement. It was in 1854 that he began those experiments, on *Pisum*, in the cloister gardens, that, after the lapse of half a century, have brought him posthumous fame. In 1865 he contributed his now memorable paper, 'Versuche über Pflanzenhybriden,' to the Society of Naturalists of Brunn; and, in 1869, another, on *Hieracium* hybrids. After 1869 he seems to have discontinued his work in hybridizing, and died unrecognized by science. This seems inexplicable, as his researches were of a nature to commend them to his studious contemporaries, among them Darwin, who entirely missed his contribution, even though the Brunn society exchanged with the Royal Society of London. But Mendel had the satisfaction of realizing that he had established a law in heredity as to the numerical ratios of the types developed in hybridizing—the grand fact for which we now prize his unobtrusive labors. He called himself a student of Kollar; and for some time he was president of the Brunn society. Since the verification of his experiments, simultaneously, in 1900, by De Vries, in Holland, Correns, in Germany, and Tschermak, in Austria, and of the translation of his paper appearing in the 'Journal of the Royal Horticultural Society of England' (1901), the literature has been full of 'Mendel's Law.'

Mendeleeff, Dimitri Ivanovitch, Russian chemist: b. Tobolsk, Siberia, 7 Feb. 1834; d. Saint Petersburg, 2 Feb. 1907. He studied at the Institute of Pedagogy, Saint Petersburg, where he gave special attention to natural science; in 1856 became docent at the University of Saint Petersburg; was at Heidelberg in 1859-61, where he published his monograph 'On the Capillarity of Gases,' soon followed by 'Organic Chemistry.' In 1863 he became professor of chemistry at the Saint Petersburg Institute of Technology, and in 1866 was appointed to a similar professorship in the University of Saint Petersburg. The results of his researches on the compression of gases, which he closely pursued from 1871 to 1875, were set forth in his work 'On the Elasticity of Gases.' He was commissioned in 1876 to report upon the petroleum industry in the Caucasus regions and in Pennsylvania. His 'Aqueous Solutions' (1886), a work on experimental chemistry, has taken its place among the most important contributions to that branch of science. In 1890 his 'Tariff Elucidated' presented the protectionist views of which he had already become a well-known advocate, and which, as a member of the Council of Commerce and Industries, he actively propagated. When the Chamber of Weights and Measures was established by the Department of Finance, in 1893, he was appointed conservator of the weights and measures. His proof of the

MOSES MENDELSSOHN.

MENDEL'S LAW — MENDELSSOHN-BARTHOLDY

periodic law (q.v.), first presented in 'Elements of Chemistry' (1868-70), is his crowning achievement in pure science. Consult Thorpe, 'Essays in Historical Chemistry' (1894).

Men'del's Law (of Heredity). See HEREDITY.

Mendelssohn, mën'dëls-sōn, Moses, German Jewish philosopher: b. Dessau, Germany, 6 Sept. 1729; d. Berlin 4 Jan. 1786. His father, Mendel, a schoolmaster, though very poor, gave him a careful education. He lived several years on the charity of persons of his own religion, devoting his time to study, chiefly in Hebrew and Hebrew literature, but also in mathematics and modern languages. In 1750 he was appointed by a silk manufacturer named Bernhard, a Jew, tutor of his children. At a later period Bernhard took him as a partner in his business. In 1754 he became acquainted with Lessing, with whom he contracted a close intimacy, which had a great influence on his mind. Intellectual philosophy now became his chief study. His 'Briefe über die Empfindungen' were the first-fruit of his labors in this branch. Mendelssohn contributed to several of the first periodicals, and now and then appeared before the public with philosophical works, which brought him fame, not only in Germany, but also in foreign countries. The most celebrated of these is 'Phædon,' a treatise on the immortality of the soul, first published in 1767. Since that time it has gone through numerous editions, and been translated into most European languages. He established no new system, but was, nevertheless, one of the most profound and patient thinkers of his age, and the excellence of his character was enhanced by his modesty, uprightness, and amiable disposition. He knew how to elude with delicacy the zealous efforts of Lavater to induce him to declare himself a Christian. To this encounter between Lavater and Mendelssohn German literature owes one of its greatest dramas, Lessing's 'Nathan der Weise,' in which the author, in the person of the hero, commemorates the virtues, the tolerant spirit, and comprehensive mind of his friend Mendelssohn. His 'Jerusalem, oder über religiöse Macht und Judenthum' (1783) was much misunderstood, partly because he attacked many deep-rooted prejudices of his race. 'Morning Hours' (Morgenstunden) was published in 1785. The last work of Mendelssohn was in defense of his friend Lessing, of whom Jacobi had asserted that he was a Spinozist, was entitled 'Moses Mendelssohn und die Freunde Lessings' (1786). Consult Kayserling, 'Moses Mendelssohn' (1882).

Mendelssohn-Bartholdy, Jakob Ludwig Felix, German composer: b. Hamburg, 5 Feb. 1809; d. Leipzig 4 Nov. 1847. The kindly influences which, like a halo, encircled the life of the illustrious man, are reflected in many of his best compositions. He was born in prosperity, reared in plenty, and at nearly all times was surrounded by conditions conducive to success. It has been said that in no way was Mendelssohn's naturalness and naïveté more evident than in his constant reference to his own foibles; and 'further, that the hearty way in which he enjoyed idleness and boasted of it, were delightful in a man who got through so much work, who was singularly temperate, and whose only weakness for the products of the kitchen was for rice, milk and cherry

pie. "I do not in the least concern myself," said he. "as to what people wish or praise or pay for; but solely as to what I myself consider good."

It is doubtful whether the history of any other great musician discloses so wide a combination of qualities. Some of his biographers have expressed the thought that his happy disposition prevented his work from attaining that degree of depth which it might have done had his genius been subjected to fiery trials. Be this as it may, the fact remains that among all the German composers there is not one who has enjoyed such universal popularity, certainly in America and England, as Mendelssohn. His oratorios, 'St. Paul' and 'Elijah,' are sung everywhere, while his 'Hymn of Praise,' the 'Overture to the Hebrides,' his symphonies, sonatas, concert-overtures, settings for certain Psalms, and 'Songs without Words' are familiar to all.

Seventy-two of Mendelssohn's numbered works were published before his death, and 47 later, while 23 of his compositions, many of them including two or more pieces, had no "opus" numbers assigned to them. Six other of his published compositions have been recorded, while his unpublished pieces, mostly in autograph, and principally composed before he was of age, are quite numerous, including 12 symphonies, several fugues, concertos, sonatas, studies, fantasias, etc.

Felix was the second child and eldest son of Abraham Mendelssohn, a Jewish banker of Hamburg, and Lea (or Leah) Salomon, a resident of Berlin, and a Jewish lady of considerable property and attainments, to whom he was married on 26 Dec. 1804. The grandfather of Felix was Moses Mendelssohn (q.v.), who settled in Berlin in 1762 and married Fromet, daughter of Abraham Gugenheim, of Hamburg. Moses' father was named Mendel, a poor Jewish schoolmaster of Dessau, on the Elbe. Thus the name Mendelssohn (son of Mendel) simply perpetuates the oriental method of name-making.

When not three years old Felix was taken to Berlin, and five years later (1816) his father took him and his sister Fanny, four years the senior of Felix, to Paris on a business trip. While there they both received lessons on the piano from Madame Bigot, but it was not till after their return to Berlin that their systematic education commenced. Ludwig Berger became their piano instructor, and Zelter taught them thorough-bass and composition. In 1824 Moscheles became acquainted with the family, and while he declined to accept Felix as a pupil, consented to offer him suggestions and advice. In the same year Spohr visited Berlin and renewed his friendship with the family, which had been formed at Cassel in the summer of 1822 where the family had gone for the purpose of introducing Felix to him. In his 8th year Felix played the piano with remarkable ability, and about a year later (1818) he made his first formal public appearance. This was at a concert given by Joseph Gugel, a virtuoso on the horn. At 11 he joined the Singakademie as an alto. In 1820 Felix commenced systematic work as a composer, although before that time he had written from 50 to 60 complete movements. The earliest date of which a dated autograph is preserved was attached to a cantata entitled 'In rührend

MENDELSSOHN-BARTHOLDY

feierlichen Tönen,' which he completed on 13 January of that year.

The following year was eventful. He composed five symphonies, nine fugues, several pieces for the piano, two operettas, and a number of songs. It was in this year, too, that he visited Goethe at Weimar. The poet was delighted with his talent. While at Weimar he played before the Grand Duke and Duchess and improvised before the Court and also before Hummel. His compositions in 1822 were very numerous, and during this and the following year he wrote six symphonies, five concertos, a piano quartette, a violin sonata, a Magnificat and Gloria, and an opera in three acts, entitled 'Die beiden Neffen, oder der Onkel aus Boston.' On 31 March he played for the second time in public, at Aloys Schmitt's concert, taking part in a duo for two pianos, and again, on 5 December, he played at a concert given by Madame Milder-Hauptmann, when he gave one of his own concertos. It was probably in this year, too, that the practice of having informal musical performances on alternate Sunday mornings at the Mendelssohn home was begun. Felix directed, his sister Fanny presided at the piano, his younger brother, Paul, played on the cello, and his second sister, Rebecca, sang.

In 1824 his musical genius showed marked advance, as evidenced in his symphony in C minor, composed between March 3 and 31. In the summer he was taken to Doberan on the Baltic, a seaside resort, and there received the impressions which later found expression in his 'Meeresstille Ouverture.' His wonderful power of extemporizing and his readiness to play the music of other composers are noteworthy features, and Hiller, who was with him in Frankfurt in 1825, was carried away with his performances. In this year he met Cherubini in Paris, whither he accompanied his father on a visit. Toward the end of 1825 Mendelssohn's father purchased a large mansion, surrounded by spacious grounds, and under the influence of this charming home he became more and more devoted to his work. The beauties of Shakespeare were here unfolded to him. Felix was especially charmed with the 'Midsummer Night's Dream,' and probably then conceived the idea of the exquisite composition bearing that name which forms opus 61 and was first produced in Potsdam 14 Oct. 1843. The overture to a 'Midsummer Night's Dream' appeared earlier, and as a piano duet, its first public performance being given at Stettin in February 1827. Either during this or the previous year, Felix entered the University of Berlin, where he showed evidences of decided literary powers. On his return from Stettin he made preparations for his opera 'Die Hochzeit des Camacho,' but owing to the opposition of the director, Spontini, it was performed only once at that time, although, strange to relate, a complete performance of it was given at Boston, Mass., on 19 March 1855.

The principal compositions during 1828 were a cantata for the Tercentenary Festival of Albrecht Dürer, a cantata for a Congress of Science, an Antiphona for four voices, and a concert overture. He also completed his overture to Goethe's 'Calm Sea and Prosperous Voyage.' During this year he organized a choir of 16 voices for practising Bach's Passion music. The year 1829 was an important one for Felix.

Hitherto his father had not permitted him to regard himself as a professional musician, but this now being determined on, arrangements were made for him to visit some of the great capitals, with a view to gaining materials for his greatest works. His first journey was to England, where he arrived on 21 April 1829. He was received with much enthusiasm and also scored a success in society. His delightful manners and unfailing animation charmed every one. In November he was again in Berlin, and during the winter he completed the 'Reformation Symphony' for the Tercentenary Festival of the Augsburg Confession. He declined the professorship of music in the University, preferring to carry out the program which his father had mapped out for him. In May 1830 he visited Weimar, where he again met Goethe, afterward going to Munich, and later to Italy. Preparations for his return began in June 1831, and after visiting many cities he arrived in Munich, where his concerto in G minor was performed for the first time on 17 October.

Another visit to London was made in the spring of 1832, during which he composed with unabated vigor. Among the more important productions of this time were his musical representation of Goethe's 'Walpurgis Night,' and the 'Fingal Overture,' which was finished in Rome. Again in Berlin in July 1832, he gave several concerts, producing the 'Walpurgis Night' at one of them. His time was fully occupied in composing, playing and conducting. His 'Italian' symphony was completed in March 1833, and sent to London where it was produced on 13 May under his personal direction. Later in the month, we find him conducting the Lower Rhine festival in Düsseldorf, where, as a result of his success, he was engaged as director of "all the public and private establishments of the town" for three years with a salary of 600 thalers. He resigned, however, during the 2d year to accept the position of conductor of the famous Gewandhaus Concerts at Leipzig, then considered the highest position in the musical world of Germany. Thither he proceeded in August 1835, to make arrangements for the season which began on the 4th of October following. Seven concerts were given between that date and 20 November, when he was shocked by the news of his father's death which had occurred the day before. For the first time his radiant disposition forsook him and he fell into a despondent mood. During this season of sadness, however, he was able to finish the oratorio of 'St. Paul' while he also maintained the excellence of the concerts for which he was responsible. The great oratorio was first produced at the Lower Rhine Festival at Düsseldorf 22 May 1836. About this time he took charge of the Frankfort Cäcilien-Verein during the illness of the director, and there made the friendship of Madame Jean-Renaud and her family. He became devotedly attached to her youngest daughter, Cécile, to whom he was married on 28 March 1837. Returning to Leipzig he conducted another successful season, closing with a performance of 'St. Paul,' for the first time produced in that city. In August 1837, he left his bride for the purpose of conducting 'St. Paul' at the Birmingham Festival. This was his fifth journey to England, and before he returned he held conferences with his friend Klingemann over the plan of a new oratorio

MENDELSSOHN-BARTHOLDY

having the prophet Elijah as the central figure. He reached Leipsic on 1 October in time to conduct the first concert of the Gewandhaus on the same evening.

The year 1839 was notable for the composition of the 'Ruy Blas' overture for the Leipsic theatre, and the setting of the 114th Psalm to music. In the following year the invention of printing was celebrated in Leipsic by a festival, and the 'Festgesang,' for men's voices, and 'Lobegesang,' or 'Hymn of Praise,' were composed for the occasion. During this year Mendelssohn accepted the direction of the musical department of the Berlin National Academy of Arts, but before entering on his duties, he made another visit to Birmingham to conduct a performance of the 'Hymn of Praise.' On his return he was installed as General-Musik-Director in Berlin, but having the privilege of living where he pleased, he returned to Leipsic. About this time he composed the music for the 'Antigone' and 'Œdipus Coloneus' of Sophocles, Racine's 'Athalie' and Shakespeare's 'Tempest' and 'Midsummer Night's Dream.'

Another sad trial now befell him in the death of his mother, 12 Dec. 1842, and in November of the following year he removed to Berlin. The king of Saxony had recently established a Conservatory of Music, a plan which Mendelssohn had long cherished, and he and Schumann were appointed professors of composition and the piano. Meanwhile the Gewandhaus concerts were left in charge of Hiller. In 1844, he visited London for the eighth time in response to an invitation to direct several concerts of the London Philharmonic Society. In October he resigned his position as General-Musik-Director in Berlin, and took a much needed rest until the autumn of 1845 when he again assumed charge of the Gewandhaus orchestra.

Early in 1846 he was back in Leipsic where he took charge of two classes in piano and composition, and among his pupils were Goldschmidt, De Sentis, Tausch and others. The season of 1845-6 was unusually brilliant in concert work, and the programmes showed a great breadth of selection. At the eighth concert he brought with him Jenny Lind, who was then heard for the first time in Leipsic. On 5 Aug. 1846, a preliminary rehearsal of 'Elijah' was held in Leipsic, and soon after he started for England on his ninth visit, the complete score having been sent over a month earlier for translation. First there was a rehearsal with piano accompaniment at Moscheles' house, followed by two full rehearsals at the Hanover Square Rooms, and later by rehearsals in Birmingham, where on 26 August the oratorio was performed for the first time in public. One of his biographers states that "there was a mad rush at the close of the performance to grasp the hand of the hero of the day, who thanked all present for their share in the performance with which he was so deeply gratified." Returning to Leipsic he remodeled the oratorio, however, making so many changes that scarcely a movement stands to-day as it was originally written. The completed edition was published in July 1847. The Sacred Harmonic Society of London now invited Mendelssohn to give a production of 'Elijah' in its revised form in Exeter Hall, and for the tenth and last time he visited London in April 1847. Four performances were given Queen Victoria and the Prince Consort being present

at the second of the series. After giving other productions of the 'Elijah' in Manchester and Birmingham, followed by a performance with the Philharmonic Society, he returned to Frankfurt, weary and utterly worn out. To add to his now unhappy condition, his sister Fanny, whom he had loved devotedly, was stricken with paralysis, and died 14 May 1847. On hearing the sad news he fell fainting and for several weeks was utterly prostrated. Seeking diversion, he revisited Switzerland during the summer, where, it is said, he applied himself to water-color painting and made excellent progress in that direction. Later he resumed composition, numbering among his productions at that time the beautiful quartet in F minor (Opus 80), and he also wrote some parts of a newly commenced oratorio, 'Christus.' He returned to Leipsic in September, but attempted nothing serious in a musical way. His spirit was broken, and he dreaded to appear in public. The beginning of the end came on 9 October while calling on Madame Frege, whom he was accompanying in his last set of songs. She left the room to order lights, says one of his biographers, and on her return found him shivering and suffering violent pains in the head. He rallied somewhat, but another relapse occurred on 3 November, and he never spoke again. He died the following day, and on Sunday, the 7th, was borne to the Paulinen-Kirche, preceded by a band playing one of his 'Lieder ohne Worte' (Book V., No. 3), which Moscheles had scored for the occasion. Thence the coffin was taken to the Alte Dreifaltigkeits-Kirchhof in Berlin, where it was deposited in its last resting place.

A cross on the grave bears this inscription: "Jakob Ludwig Felix Mendelssohn-Bartholdy: geboren zu Hamburg, am 3. Feb. 1809; gestorben zu Leipzig am 4. Nov. 1847."

Mendenhall, men'dên-hâl, **Thomas Corwin**, American physicist: b. near Hanover town, Ohio, 4 Oct. 1841. He was educated in the public schools and by his own efforts obtained a knowledge of physics and higher mathematics. In 1873 he became professor of physics and mechanics in the Ohio University, where he remained until 1878, when he accepted a call to the chair of physics at the Imperial University in Tokyo, Japan. There he founded a laboratory, an observatory, a scientific society, inaugurated a system of lectures, which work was highly approved by the Japanese government. In 1881 he returned to the Ohio University, and in 1884 accepted a position in the Signal Service at Washington. In 1886 he was elected president of the Rose Polytechnic Institute, but resigned in 1889 to become superintendent of the United States Coast and Geodetic Survey, and from 1894-1901 was president of the Worcester Polytechnic Institute. He has published several scientific papers and a book entitled 'A Century of Electricity' (1887).

Mendes, Catulle, kâ-tûl môn-dās, French writer: b. Bordeaux 22 May 1841. His verse is marked by extreme devotion to form. He has also written a great deal of prose—short stories, longer works of fiction, dramas. There is much affection about them all. Among the titles of his books are: 'Poésies' (1878); 'Monstres Parisiens' (1882); 'La Rose et le Noir' (1885); 'Grande Maguet' (1888). Of his plays may be cited 'Le Capitaine Fracasse' (1872) and 'Fiamette' (1889).

Mendes Leal da Silva, José, hō-sā' măn'-dāsh lā-âl' dā sêl'vā, Portuguese statesman and poet: b. Lisbon 18 Oct. 1818; d. Cintra 14 Aug. 1886. He was minister of the navy and of foreign affairs; ambassador to France 1874-83; and to Spain 1883-6. His vogue as a poet has been very great in his own country and his 'Songs' ('Canticos') were first collected in 1858. He wrote also a large number of plays, some of them very popular on the Portuguese stage, as 'Uncle Andrew from Brazil'; and 'The Sportsman'; and also several romances. He became a member of the Portuguese Academy in 1845.

Mendez-Pinto, măn'dāsh pên'too, **Fernao**, or **Fernam**, Portuguese traveler: b. Montemor-o-Velho, near Coimbra, Portugal, about 1510; d. Almada, near Lisbon, Portugal, 8 July 1583. He departed for the Indies in 1537, returning in 1558, and after his death a very curious relation of his voyages, 'Perigrinacao de Fernam Mendez-Pinto' was published, which has been translated into French, English, and other European tongues. Congreve, in his 'Love for Love,' called him 'a liar of the first magnitude,' and from that time his narrative

was considered as a romance; but his good faith and veracity are now generally admitted.

Mendiburu, măn-dê-boo'roo, **Manuel de**, Peruvian soldier and historian: b. Lima 1805; d. there 21 Jan. 1885. While a student he joined the patriot forces in 1821, was captured by the Spanish and held prisoner till the close of the war. Among various civil and military posts afterward held by him were those of minister of war and finance. He published a 'Diccionario historico-geografico del Peru,' a work of great value and highly prized by scholars. The first part, in eight volumes, deals with the Inca and colonial periods, and its publication, begun in 1874, was concluded after General Mendiburu's death. The second part has not been published.

Men'dicancy, a condition of permanent pauperism, where professional beggars are so numerous that government laws are necessary to remove or control them. A population of mendicants naturally results in a criminal community, and all countries containing this element have endeavored to remove this evil by legislation. There were beggars in biblical times. As early as 1351 France was compelled to pass laws against "Lazy persons, truants, and able-bodied beggars." Laws were passed in England on this subject as early as the time of Henry VIII. Mendicity has been found to exist to a greater extent in South European countries than elsewhere, and in Spain and Italy the professional beggar has been one of the greatest evils, the standard of prosperity, morality, and intelligence declining as mendicity increased.

According to the census statistics of 1900 there were 91,227 professional beggars in Spain, of whom 51,948 were women. In some of the cities beggars are licensed to carry on their trade. Seeking alms is recognized as a legitimate business, and the municipality demands a percentage upon the collections. Seville is the only city in the kingdom which forbids begging upon the streets. In some of the other towns beggars are allowed to come out and ply their trade one day in the week, perhaps Friday or Sunday, when the streets swarm with them as they go from house to house, sometimes on horseback, and it is said sometimes in carriages also. In Madrid there is no restriction and no license, and the streets are lined with them.

In 1903 the Spanish government passed a new law which aims to suppress vagrancy and begging, especially in the case of young children. It enacts that the parents and guardians of minors arrested for begging or wandering and sleeping on the highways and the public thoroughfares shall be liable to punishment by fines or terms of from 1 to 15 days' imprisonment. Heavier fines or from 15 to 30 days of imprisonment are imposed on parents and guardians who ill-treat children in order to make them beg, or who sell them to others for the purpose of begging. All persons convicted will forfeit their right to have the custody of the children for two years or more, at the discretion of the courts and authorities, who will place the minors in proper establishments for their support and education, until it is possible to restore them to their parents. This law, though introduced by the Minister of the Interior, was prepared by the Social Reform Committee, and drafted by

MENDICANT ORDERS — MENDOZA

a distinguished professor at the Madrid University, Senator Santa Maria de Paredes, formerly tutor in public law and economics to the king.

In Mexico, both Indians and native Mexicans to the number of thousands make up the army of professional beggars, and Mexico appears to have no laws to regulate them. In the Mexican cities and at fairs and festivals the mendicants are to be seen in astonishing variety; some maimed, some blind, and able-bodied fellows with most artistic "make-ups" of tattered garments and unkempt hair and beards. Some of these stand before one silently with a dumb appealing look in their eyes. Others kneel in the midst of the way, and fill the air with their doleful stereotyped appeals for charity. These beggars are humbugs after the manner of their kind the world over.

In the United States, where labor is in greater demand and better paid than abroad, there seems to be no excuse for mendicity, and yet there are many professional beggars here, largely able-bodied foreigners. The laws of Massachusetts, New York, and some other States make vagrancy a crime, and authorize the commitment of tramps to the workhouse, house of correction and common jail for varying periods. In the Atlantic coast States the evil is developing with alarming rapidity and demands more stringent treatment than heretofore.

New York city is a beggars' paradise. Between 6,000 and 8,000 professional mendicants make that city their home. Every other city in the United States suffers from the professional beggar, but not to the same extent as New York. The outdoor officer of the Charity Organization Society says that mendicants from all parts of the country flock to New York because the indiscriminate giving there is so common. Cities and States ship their beggar population to New York. About 10 per cent of these beggars are women.

Through the winter the arrests of professional beggars in New York average 200 a month. For the first offense the beggar gets five days' imprisonment, and for the second, third, and so on he should receive 40, 80, 160 days, and finally six months. But as he comes up under a different name each time, five days is his usual sentence. At the end of that short period he is preying on the community again.

Mendicant Orders. See MONASTICISM.

Mendive, măn-dě-vă, Rafael Maria de, Cuban poet: b. Havana, Cuba, 24 Oct. 1821; d. Matanzas, Cuba, 1886. His first collection of poems (1847), entitled 'Passion-Flowers,' is widely popular. Banished in 1869, he lived alternately in New York and Nassau, writing legends and stories in verse. He was one of the most notable of Spanish-American poets; and many of his verses received English, French, and Italian translations.

Mendocino. See CAPE MENDOCINO.

Mendo'ta Lake. See FOUR LAKES.

Mendoza, mën-dô'thă, Antonio de, Spanish administrator: b. about 1485; d. Lima, Peru, 21 July 1552. In 1535 he was appointed by the Emperor Charles V., with whom he was in great personal favor, viceroy of New Spain (Mexico), being the first of 64 viceroys, with the longest administration, and that which shows the best record, in the history of that

provincial government. He made many reforms, especially in relieving the oppressed natives; developed agriculture and mining; established the first Mexican mint; founded the first college; and introduced the first printing-press. In 1551 he became viceroy of Peru, where he caused to be prepared a code of laws that has been the basis of the colonial and, to a large extent, of the present legal system of the republic. It was under Mendoza's administration in Mexico that Francisco Vasquez de Coronado (q.v.) undertook his famous exploring expedition.

Mendoza, Diego Hurtado, dē-ă'go hoor-tă'do, Spanish author and statesman, great-grandson of the Marques de Santillana (q.v.): b. Granada 1503; d. Madrid 15 April 1575. He was educated, as a younger son, for the Church, but, after studying Arabic at Granada and the humanities at Salamanca, entered the army, and in 1525 fought at Pavia. He acted as Charles V.'s ambassador to England in 1537, to Venice in 1538, to the Council of Trent in 1545, and to the Papal See in 1547, when he became governor of Siena. With Philip II. he quarreled, and in 1564 was interned in Granada, only returning to court in 1574, soon before his death. To his stay in Italy was due his influence in making the Spanish lyric thoroughly Italianate; and from Italy he brought an unusual knowledge of the classics as well as a fine collection of Greek manuscripts. Mendoza also perfected the Spanish poetic epistle. The famous romance, 'Lazarillo de Tormes,' has been ascribed to him. But his greatest work is his history of the Moorish insurrection, 'Guerra de Granada,' a model of historical impartiality, and on a theme for which knowledge of Arabic peculiarly fitted him. So impartial was this work that it was not published complete for many years, and even now a good edition is a desideratum. Consult the biography in German by Fesenmair (1882).

Mendoza, Pedro de, Spanish explorer in American, founder of Buenos Ayres: b. Guadix, Granada, about 1487; d. at sea 1537. He was a favorite of Charles V.; fought bravely in Italy; and in April 1535 left Spain with 12 ships and 800 men, sailed up the Plata River, and founded the city then called "Nuestra Señora de Buenos Ayres." His further movements were unfortunate; Indians and disease attacked his men, three fourths of whom, including his own brother, were lost. The natives captured and burned the city, and Mendoza, rescued none too soon by his brother, who came with reinforcements, set sail for home. But his health and reason were undermined and he died on board ship.

Mendoza, Argentina, a province in the western part, on the eastern slope of the Andes Mountains; area, 54,000 square miles. Mount Aconcagua, 22,427 feet, is on the northwestern boundary. The western part of the province is mountainous, the eastern part pampa land and fertile where watered by the streams or by irrigation. It is rich in minerals, especially silver and copper. Coal and petroleum abound. Grapes grow luxuriantly and a large quantity of wine is shipped to the other provinces. Cattle, hides, and wool are the chief exports. Wheat and corn are increasing in importance. Pop. 118,000.

MENDOZA — MENGES

Mendoza, Argentina, city, capital of the province of Mendoza; at the base of the Andes, on the eastern side of the mountains, on the railroad which extends from Buenos Ayres to Valparaíso, Chile; about 600 miles west by north from Buenos Ayres and 165 miles east of Valparaíso. It is about 2,400 feet above the sea. The city was founded in 1559. In 1861 it suffered from an earthquake which killed about 10,000 people and destroyed a great part of the city. It is the seat of two national normal schools, a national college, and an agricultural institute. Pop. 20,000.

Mene, mē'nē (numbered); **Tekel** (weighed); **Upharsin** (divided), the Chaldee words traced on the wall at Belshazzar's feast, and significant of his impending doom (Dan. v.). The astrologers could not read them, because they were written in antique Hebrew characters, but Daniel understood their awful meaning; and the same night witnessed their fulfilment.

Menedemus, founder of the school of philosophy called Eretrian from his native city Eretria: b. about 351, d. about 277 B.C. Traditions vary as to whether he turned to philosophy under the influence of Plato, or under that of Stilpo of Megara, but his tenets seem to have most resembled those of the Megarian school.

Menelaus, mēn-ē-lā'ūs, in Greek legendary history the son or grandson of Atreus, and brother of Agamemnon. From his father-in-law Tyndareus, whose daughter Helen he married, he received the kingdom of Sparta or Lacedæmon. Paris, son of Priam, king of Troy, having carried off his wife Helen with a part of his treasures, and some female slaves, and conveyed them to Troy, Menelaus, accompanied by Ulysses, went thither to demand the restitution of his wife and property, and this being refused, he summoned the Greek princes to revenge the affront according to their promise. After the conquest of Troy Menelaus took Helen to return with her to his native land. Eight years he wandered before he reached home. On the island of Pharos he surprised Proteus asleep and compelled him to disclose the means which he must take to reach home.

Men'elek, or **Menilek**, emperor or negus of Abyssinia: b. Ankobar 17 July 1844. His father, crown-prince of Shoa, died in 1855; the boy then fell into the hands of Theodore, his father's rival for the throne, who kept him under guard in Gojam, and attempted to win his allegiance by marrying him to one of his own daughters and giving him the high title of Dejasmatch. Menelek escaped to Shoa in 1865, raised an army, made himself king, and in 1889 succeeded John II. as negus of Abyssinia. For this place he claimed a hereditary right because of his descent from Balkis, queen of Sheba, and Solomon. He trained his army partly after European methods; protested against Italy's claim to a protectorate; defeated the Italian force at Adowa in 1896, but chivalrously permitted his captives to go away unharmed; and by the Peace of Addis Abeba (26 Oct. 1896) won Italy's acquiescence in his independence. In 1898 he came to an agreement with Great Britain, by which his boundaries are left intact; and in October 1903 received with much cordiality an envoy of the United States, who came to proffer Menelek a com-

mercial treaty and to invite him to the St. Louis Exposition.

Menendez de Avilés y Marquez, mā-nēn'-dēth dā ā-vē-lās' ē mār'kēth, **Pedro**, Spanish captain, founder of the city of Saint Augustine, Fla.: b. Avilés, Asturias, 1519; d. Santander 17 Sept. 1574. In June 1565 he sailed with 1,500 men in 19 vessels to dislodge the French in Florida; landed there 28 August; and 6 September began a fort, the nucleus of the present town. He attacked the French garrison at Fort Caroline, during the absence of part of the force, which had set out to attack him but was storm-stayed and finally wrecked. Menendez slaughtered the remnant at the fort and those saved from shipwreck. He returned to Spain in 1567; visited America twice again, strengthening St. Augustine in 1568, and in 1570 sending a party of colonists to the Chesapeake and up the Rappahannock, where they were massacred by the natives; and was recalled to Spain shortly before his death. During the last two years of his life he was governor of Cuba.

Menendez y Pelayo, ē pā-lā'yō, **Marcelino**, Spanish critic: b. Santander 3 Nov. 1856. He was educated at Madrid and Paris; in 1878 became professor of philosophy and letters in Madrid; three years later was elected to the Spanish Academy; and in the late '90's became director of the Biblioteca Nacional. He is an ardent admirer of the classics and is theologically and politically a thoroughly strict and conservative Catholic. His style is wonderfully finished and elegant, and his matter well handled. He wrote: 'Estudios críticos sobre Escritores Montañeses' (1876); 'Horacio en España' (1877); 'Historia de los Heterodoxos Españoles' (1880-1); 'Calderon y su Teatro' (1881); 'Odas, Epístolas y Tragedias' (1883); 'Historia de las Ideas estéticas en España' (1884-91).

Menes, mē'nēz, according to Egyptian traditions, the first king of Egypt. Herodotus relates that he was the founder of Memphis, which he built on a piece of ground which he had recovered from the Nile by altering the river's course. According to Diodorus, Menes introduced into Egypt the worship of the gods, as well as a more elegant style of living. He has been identified by some with the Mizraim mentioned in Gen. x. 6. A tomb supposed to be that of Menes was discovered near Nakâdeh by De Morgan in 1897. See EGYPT.

Meng-Tse, mēng-tsē'. See MENCIOUS.

Mengs, Anton Raphael, German painter: b. Aussig, Bohemia, 12 March 1728; d. Rome 29 June 1779. In early childhood his father, Ismail Mengs, a miniature painter of little talent, who was settled at Dresden, took him in hand to make a painter of him, and in 1741 carried him to Rome and set him to study the antique, and to copy Michelangelo and Raphael. He was compelled to do a certain task in painting every day; his day's work subjected to severe criticism; and he was even punished if it was not satisfactory. From this constant practice he early gained skill as an artist, and when he returned to Dresden his talent and proficiency were at once recognized by August III., who appointed him court painter, and gave him permission to return to Rome. At Rome he attended the Academy, and in 1748 produced a

MENHADEN—MENINGITIS

large and elaborate composition, 'The Holy Family,' taking as model for the Mother of Jesus a beautiful peasant girl, whom he afterward married. On his return to Dresden he was commissioned to paint an altar-piece, 'The Ascension of Christ,' for the high altar of the Chapel Royal, and was given permission to return to Rome for the purpose of doing so. A new Academy of Painting having been opened in the Capitol he was appointed director, and painted for the Celestines the ceiling of their church, San Eusebio, for Cardinal Albani the 'Parnassus' in the ceiling of his villa, and several oil paintings, including 'Cleopatra,' 'The Holy Family,' and 'The Magdalen,' for private persons. When King Charles III. of Spain summoned him to Madrid he executed for him in fresco there 'The Assembly of the Gods' and 'The Descent from the Cross'; he also completed the altar-piece for Dresden. He returned to Italy in 1769, stayed eight months at Florence and painted for the pope a ceiling fresco for the Vatican library. In 1772 he went to Spain and produced for the king the fresco 'Apotheosis of Trajan,' his finest work, but returned to Rome in 1775. On his death the Cavalier d'Azara set up a statue to him and Catherine II. of Russia raised a splendid tomb for him in St. Peter's. He was certainly one of the most important painters of his day, and if he possessed none of the free and living originality of genius he was a master of noble composition and design. He was catholic in taste, and eclectic in style, drawing inspiration from the antique, as well as imitating Raphael, Titian, and Correggio, whose styles he tried to blend. Consult: Woermann, 'Ismail und Raphael Mengs' in the 'Zeitschrift für bildende Kunst,' Number 5, 1893.

Menha'den, a species of fish (*Brevoortia tyrannus*) of the herring family (*Clupeidæ*). Owing to the very large number of local names applied to this species much confusion concerning its identity and distribution exists in the minds of fishermen and others having only an unscientific knowledge of fishes. The name which heads this article is used chiefly in southern New England, and has become the book name of the species. North of Cape Cod it is the pogy, or occasionally the hard-head; in New York and New Jersey mossbunker, or some variation, as bunker or marshbunker, are the favorite names; the fishermen of Delaware and Chesapeake Bays know it as the bay alewife, and in the latter region and southward also as the bug-fish or bug-head, for a reason indicated below; still farther south it becomes the fat-back, and so on through a list of upward of 30 names, each of which has its advocates as the correct one. The specific name *tyrannus* does not refer to any quality of disposition of the menhaden, but was suggested by an association in the mind of the describer between a parasitic crustacean (*Oleocira prægustator*) living in the mouth of the fish and the foretasters of the Roman emperors. Like some other pelagic and migratory fishes the menhaden is exceedingly irregular in its movements and variable in abundance and distribution from year to year, but its general range is from Nova Scotia to Brazil and oceanward, so far as observed, to the Gulf Stream. In spring it approaches the coasts and extends northward with the alewives

and other species, probably for the purpose of spawning in brackish water, though little is actually known of its spawning habits. In winter Cape Hatteras marks the northern limit of its abundance. The menhaden swims in compact schools of large size, the movements of which at the surface, or sunken to a greater depth, are extremely irregular. Their seeming capriciousness has, however, been recently explained by a study of their food. Their gill arches bear a complicated and efficient system of filters, through which a large volume of water is strained as the fishes swim about with opened mouths and distended gill covers. Great quantities of minute animal and vegetable organisms are thus secured and swallowed.

From the other herrings the menhaden is readily distinguished by its very large head, large mouth, complex gill strainers and crenulated scales. The body is deep, the fins small, the mouth toothless and the color bluish and silvery, with one large and several small black spots.

Of all Atlantic coast fishes this is by far the most abundant, and, notwithstanding the incalculable millions annually destroyed by man and the predaceous fishes, birds and cetaceans, its numbers have shown no certain and permanent diminution, except in partially enclosed waters. Owing to its strong oily taste and extreme bonyness its value as human food is very slight, but as furnishing food for other fishes, as bait and for the manufacture of oil, fertilizer and other products, it has a very great economic importance. Large companies control its capture for the latter purposes and, besides pound nets, utilize many steamers provided with purse seines and derricks by means of which entire schools are taken at a haul and lifted on deck. The oil is extracted and the solid parts ground up for fertilizer at shore factories. The product varies from year to year, but the total weight of fish taken runs into the hundreds of million pounds. The following statistics are for the year 1888: Capital invested, \$2,239,755; number of factories, 55; number of steamers, 55; sailing vessels, 66; persons employed, 3,229; menhaden handled, 609,715,930; total value of products, \$1,655,920; oil manufactured, 2,818,097 gallons; fertilizer prepared, 48,344 tons. Consult Goode, 'History of the Menhaden,' Rep. U. S. Fish Commission, 1879.

Men'hirs, elongated, rough-hewn monoliths standing with one end in the ground. They are found of various sizes, from about 6 to as much as 67 feet high, the latter being the height of that at Locmariaquer in Brittany. Singular superstitions naturally attach to some of them. See **STANDING STONES**.

Meningitis, inflammation of a membrane, especially of the meninges or membranes of the brain and spinal cord. It is very rarely a primary condition, and in any of its forms may be confounded with typhoid fever, mania, etc. Inflammation of the meninges is generally confined to the pia mater and the arachnoid membrane (leptomeningitis), but may extend to the dura mater. Pachymeningitis, inflammation alone or chiefly of the dura mater, may extend to the other membranes. Inflammation of the cerebral meninges is cerebral meningitis; of the spinal meninges, spinal meningitis; of those of the brain and spinal cord, cerebro-spinal meningitis. Ascending meningitis is a meningitis

MENINGITIS

ascending from the lower part of the spinal cord.

Pachymeningitis is comparatively rare. The form involving the external surface of the dura mater results from blows or other injuries, and from osseous growths. There may be no well-defined symptoms, but usually is local headache and tenderness on pressure. If the dura mater, which is normally free, is bound to the skull by fibrous exudation, and especially if pus forms and hemorrhages occur, there are symptoms of pressure. Inflammation of the internal portion of the dura mater may result from the extension of inflammation from adjacent parts, such as the ear, the frontal or the ethmoidal sinus; or it may attend cases of pernicious anæmia, chronic syphilis, tuberculosis, and chronic wasting diseases. It occurs chiefly in old age, but has been seen in children. There are fibrinous deposits and extravasations of blood in cysts (hæmatoma), and occasionally pus forms. The brain is anæmic, sometimes softened. The symptoms are those of irritation—convulsions, vomiting, contracted pupils, a slow irregular pulse, etc.,—and those of compression or pressure—coma, etc. Pachymeningitis is usually fatal.

Cerebral meningitis (simple or cerebral meningitis), in the acute form, is not common, and is most apt to occur in men engaged in hard mental pursuits. It may be caused by injuries, by sunstroke, by spirituous liquors, etc., and is very dangerous, death usually occurring in from three to eight days. The brain is reddened and covered more or less with pus and coagulated fibrin or lymph, and its superficial layer is softened. There is almost always watery effusion into the brain-cavities. The symptoms are those of three stages: (1) headache; (2) delirium; (3) coma. At first there may be slight fever, some photophobia, frequency and irregularity of the pulse, and some contraction of the pupils. There is a disposition to vomit, a slowness in movements of the bowels, and often hyperæsthesia. Then comes delirium, which may or may not be active; the patient talks much, and tries to get out of bed; does not obey readily. There is more or less trembling of the limbs, with difficulty in moving them. One pupil is likely to be dilated. Sometimes strabismus occurs; the pulse is very irregular; and paralysis begins. Then follows coma, loss of sense, sensation, and of voluntary motion; there is sighing, the pulse is frequent and weak, the pupils do not respond readily to light, and the capillaries of the skin and eye are congested. Recovery from this disease cannot occur after the period of coma begins.

Sub-acute or chronic cerebral meningitis is a secondary disease, sometimes associated with chronic syphilis, Bright's disease, alcoholism, etc., though the cause is not always ascertained. The lesions are similar to those of acute meningitis, but less pronounced. There is less of serum and pus, and the exudated fibrin is more circumscribed. The symptoms are insidious and vague. Headache, vomiting, and photophobia are rare. The slight delirium is followed, it may be, by somnolency, irregular pulse, strabismus, and sighing respiration. With coma the pulse is rapid, 120 or more, and the patient dies as in acute meningitis.

Tubercular meningitis (a form of cerebral meningitis), also known as acute hydrocephalous granular meningitis and basilar meningitis,

is an acute tubercular inflammation of the pia mater, caused by a deposit of miliary granules over the surface of the brain, but most numerous at the base, in the track of the cerebral vessels, and in their sheaths. There is a noticeable vascularity, especially in the ventricles. The pia mater is thickened and opaque and covered with a semi-purulent exudation. Serum fills the ventricles and foramina, pressing upon the convolutions, and assists in softening portions of the brain. The lesions in this disease are rarely limited to the brain; tubercles are found in other organs, especially the lungs. The disease is a phase of that protean malady, tuberculosis, though the cerebral lesions may first be noticed. The primary causes are a hereditary diathesis (scrofulous or tuberculous), foci of caseous degeneration in some organ, a suppurating joint, or a scrofulous inflammation of bone. Exciting causes are impure air, exposure, unwholesome food, bad drainage, blows upon the head, excessive study and worry, etc. Though the disease is essentially a disease of early life (from nine months to ten years), it also attacks adults. Most of those affected die in from two to six weeks. The symptoms may be classed under three heads: (1) obscure symptoms; (2) those of rapid development; (3) those of coma. There are seen listlessness, loss of appetite, occasional vomiting, slowness of the bowels, and somewhat frequent pulse. Sometimes there is headache, a remittent form of fever, and then rapid development of diagnostic symptoms. The patient talks a good deal. There are irregularity of the pupils and pulse, a sharp "cephalic" cry, severe headache, insensibility to light and sound, grinding of the teeth, a flushed face in paroxysms, usually before convulsions, rolling and drawing back of the head, urine scanty and high-colored, oscillation of the eyes, obstinate constipation, etc. With coma comes strabismus; the pupils do not contract under the influence of light, but will contract and expand when the bowels rumble or the patient is moved. There are convulsions, paralysis, and automatic movements of the feet and hands, it may be for hours. The thumb may be turned in. There is a hollowed abdomen (boat-shaped), and congestion of the eyes, a puriform secretion sticking the eyelids together; involuntary discharge of bowels and bladder, are common. For treatment of this affection place patient in bed, in a quiet room; give easily digested food; apply an ice-cap to the head and warmth to the feet. Further treatment should be in the hands of a physician. Much can be done by parents and guardians to prevent the onset, by not developing the nervous system at the expense of the muscular and digestive systems. Precocious children are to be judiciously restrained, and outdoor life encouraged.

Spinal meningitis is not common; it is usually caused by injuries, is liable to occur in children with spina bifida, and is rarely amenable to treatment. Death occurs usually in from eight to ten days, either from extension of inflammation to the brain and pressure there by fluid, or from asphyxia due to spasms of the respiratory muscles. The lesions are similar to those of cerebral meningitis. The chief symptoms are pain in the spine and extremities, increased by movements of the body, great sensibility of the surface of the body, spasms of muscles, opisthotonos, and dyspnœa.

Cerebro-spinal meningitis, or spotted fever, usually more of a fever than an inflammation, is due to blood-poisoning, generally appears as an epidemic, and is very dangerous. Death frequently occurs in a few hours; recovery usually requires 30 or more days. The disease has spread over sections of this country two or three times, mainly in the winter and spring. One form is characterized by fever with no eruption; the other by fever and an eruption. The disease has been confounded with typhus and typhoid fever. The symptoms are a chill or chilliness, followed by nausea and vomiting, fever, violent headache, sometimes with pain down the spinal column, great prostration, vertigo, tetanic rigidity of muscles, delirium, and other symptoms of meningeal irritation, followed more or less rapidly by those of coma. When there is an eruption it usually appears early, and consists of dark blotches, from the size of a pinhead to that of a nickel, and is not marked on the extremities.

Where death occurs within 12 hours from the time of attack only a congestion of blood-vessels of the brain and, it may be, of the spinal cord, is generally found. Almost always there is lymph or pus beneath the pia mater, and sometimes serous effusion in the pleura, pericardium, or peritoneum. The blood undergoes a change, ecchymoses are found sometimes in the muscles, or in connection with the pericardium or pleura. The most important thing in treatment is the production of free perspiration, with rest in bed. The use of blisters, etc., should be left to the physician.

Menippus, mē-nīp'ūs, Greek cynic philosopher, a native of Gadara in Palestine, and supposed to have flourished about 60 B.C. His writings were chiefly of a satirical kind. Lucian styles him "the most snarling of cynics," and in two or three of his dialogues introduces him as the vehicle of his own sarcasms. It appears that his satires were composed in verse and prose, on which account those of Varro were denominated Menippean, and for the same reason the name of *Satire Ménippée* was given in France to the celebrated piece written against the League and Philip II. of Spain, its head. His writings are lost.

Men'ken, Adah Isaacs (originally DOLORES ADIOS FUERTES), American actress: b. near New Orleans, La., 15 June 1835; d. Paris, France, 10 Aug. 1868. Making her début with her sister as danseuses, at the New Orleans French Opera House, she was received with marked favor and visited Cuba, Texas, and Mexico. On her return to New Orleans, she published a volume of verse and taught French and Latin at a girls' academy in that city. In 1858 she appeared in 'Fazio' in New Orleans, and went to England in 1863-4, assuming the role of "Mazeppa" at Astley's which won her popularity. On 30 Dec. 1866 she played in Paris for 100 nights, and later in Vienna and London. Her last appearance was in Paris in May 1868. She was famous for her marriages and divorces; Alexander I. Menken, John C. Heenan, J. H. Newell, and James Barclay being her successive husbands.

Menno Simons, Dutch religious reformer: b. Witmarsum, Friesland, 1492; d. Oldesloe, Holstein, 13 Jan. 1561. He was ordained priest in the Roman Catholic Church and took pastoral work in the village of Pingium (1524), and

from a study of the New Testament, undertaken (1530) to solve his doubts about transubstantiation, he was induced to become an evangelical preacher and finally left the church of his ordination. The martyrdom of Sickinge Snyder at Leeuwarden for Anabaptism impelled him to consider the Scriptural grounds for infant baptism. He was finally converted to the cause of the Anabaptists, but never sympathized with the excesses of Münster and wrote a diatribe against John of Leyden (q.v.) (1535). In 1537 at the request of a number of Anabaptists of Groningen he assumed the functions of an Anabaptist preacher and exercised, by his moderation, a most salutary influence over his fellow ministers. He now married, his change in faith having superseded his vow of celibacy, and began to travel as an evangelist not only in Friesland but throughout Holland and Germany as far as to Livonia. Being persecuted from place to place he finally settled in Oldesloe in Holstein, where he closed his ministry with the consciousness of having founded a large and flourishing sect, whose subsequent history is related under the title Mennonites (q.v.).

Views of Menno Simons.—Menno was rather a preacher of a system of personal sanctity than either a dogmatist or a violent fanatic like some of the Anabaptists. He was a man of pure moral and devotional enthusiasm, whose account of his own conversion reads like a passage from the 'Confessions' of Augustine. He sums up the results of his labors as consisting in the conversion and recovery of the wicked. Yet he formulated a somewhat vague profession of faith. He believed in the divinity of Christ, who was born on earth in Mary, that is, without taking upon him human flesh and blood. He rejected infant baptism, and baptized those only who made a personal profession of faith in Christ. He particularly emphasized the power of excommunication possessed by the Church, without which "the spiritual Kingdom of God on earth cannot," he said, "exist in purity and piety." He believed in the coming millennium (q.v.); he excluded civil magistrates from church membership on the ground that the church was a theocracy whose magistrates were the ministers. He declared that war and all taking and administering of oaths were unlawful, and regarded human science as useless, even pernicious to a Christian. These decrees, however, as modified by the explanations of Menno, differed little from those generally promulgated by the Reformed bodies of his day. His principal teaching was of a moral and practical character. He was a meek, humble, noble-minded man, carried away with the spirit of his times, encouraging all that was good and pure among his followers, and sternly rebuking the guilty. The best edition of his work is 'Opera Omnia Theologica al de Godgeleerde werken vann Menno Simonis' (1681). Consult: Harder, 'Leben Menno Simons' (1846); Roosen, 'Menno Simons den evangelischen Mennonitengemeinden geschildert' (1848).

Mennonites, members of a Christian sect founded by Menno Simons (q.v.). The Anabaptists of the Netherlands, who were Menno's followers, did not call themselves Mennonites until 1530, when they organized and established their union. This union was, however, early disturbed by the complications springing from

MENNONITES

the most impracticable of their disciplinary canons, namely, that on the subject of excommunication. One section of the church wished for the strictest enforcement of the rule, and were called *die Feinen*, the Fine, and generally known as Flemings or Flandrians, from their province; these were the rigid literalists of discipline. The others, *die Groben*, the Coarse, or Waterlanders, so called from the district of Waterland, which they occupied, were milder in their interpretation of the canon. These latter were ultimately expelled from the body. Another schism took place at Amsterdam in 1664, between the Remonstrants (q.v.) and the orthodox party. By the year 1811 these breaches were all healed and a closer fellowship than ever bound the Mennonites together on the basis of a belief in baptism by infusion, for which adults only were eligible. Their disciplinary canon, however, modified by time or expediency, rests on the principle that the kingdom of Christ established on earth is a visible church, or community, into which the holy and just alone are to be admitted; and which is exempt from all civil institutions and the restrictions of civil law. The history of the spread of this strict and exclusive sect is interesting.

The Mennonites in Germany and Prussia.—The sect quickly overflowed the boundaries of the Netherlands, and in the 17th century its representatives were numerous in Germany, being counted at 70,000 in Moravia alone. Wherever they settled their Dutch thrift and industry caused the wilderness to blossom as a rose. Ferdinand II. expelled them in 1622; in 1730 and 1732 their refusal to serve in the army brought on them the threat of expatriation. In 1789 they were forbidden to become land-owners, but their numbers in all Germany to-day are estimated at 18,000.

The Mennonites in Russia.—Catharine II. learning of their excellent qualities as colonists, invited the Mennonites to Russia in 1786 and three years later 228 families settled there. These were followed by many others. They were guaranteed safety to life and property, freedom of worship and a grant of land to each family, exemption from taxes and, among other privileges, exemption from military service in perpetuity. Mennonite immigration continued up to 1817. Since then these sectaries received other tokens of favor and good-will from the imperial government. But in the last half of the 19th century the condition of things changed. An edict addressed to all colonists in the empire announced that in 10 years the stipulation as to their exemption from military service would expire. The Mennonites were allowed 10 years to leave Russia, and after making inquiries as to advisability of crossing the Atlantic, they decided to leave Europe, and the United States was considered preferable to Canada as a place of settlement. Immediately \$20,000 was raised for the expenses of a commission of 12 men who should spy out the land and choose the most favorable spot for a Mennonite settlement. The western prairies and some of the Southern States were selected as most suitable, and large purchases of land were made.

The Mennonites in the United States.—Mennonites had settled in the United States as early as 1683. William Penn was struck by their resemblance in social habits to the Quakers, and invited them to settle in Pennsylvania. His re-

quest was accepted, and the first party of Mennonite immigrants had in half a century from their arrival increased to 500 families. They were most numerous in Germantown and Lancaster County. Spreading to Maryland, Ohio, Indiana, and New York, they became diffused over every quarter of the Union and of Canada, though most thickly settled in Pennsylvania, Ohio, Maryland, and Virginia. It is calculated that to-day they number 55,554 members, with 1,112 ministers and 673 churches. But the followers of Menno Simons since their departure from Europe have felt the liberty of this new environment, and are now cut up into no less than 12 separate and independent bodies. The oldest and largest of these is (1) the Mennonite Church, which includes about two fifths of the whole sect. It is most largely represented in Pennsylvania and Ohio, and has a publishing house at Elkhart, Ind., from which are issued four newspapers, one review and a great amount of Mennonite literature, historical, theological and educational. (2) The Bruederhoef Mennonite Church has five congregations, 352 members, and 9 ministers. They trace their origin to Jacob Huter, who was burned at the stake in Innsbruck, 1536, and they settled in the United States in 1874. (3) The Amish Mennonite Church, second in importance among the divisions of this sect, has 365 ministers, 124 churches, and upward of 13,000 members. It consists of the followers of Jacob Amen, who separated from the main body in Switzerland, 1620. (4) The old Amish Mennonite Church, which has 2,438 members, 75 ministers, and 25 churches, adheres strictly to the ancient customs and ordinances of the sect and rejects all innovations. (5) The Apostolic Mennonite Church, a branch which came to the United States at the end of the first half of the 19th century, has two churches and about 200 members. (6) The Reformed Mennonite Church, started in 1812 under John Herr with the purpose of reviving the primitive customs of the sect. It consists of about 1,600 members and 43 preachers. (7) The General Conference Mennonite Church originated as a sequel to an attack made on a minister, John Oberholtzer, in Pennsylvania, who in 1848 was charged with introducing innovations. The followers of Oberholtzer formed this branch under him, and it now numbers about 10,000 members, and 128 preachers. (8) The Church of God in Christ started forth in 1850, under a missionary, John Halde-man. It adheres to the original doctrine and discipline and comprises 449 members. (9) The Old or Wislar Mennonites sprang from a division or dispute consequent on the introduction of Sunday Schools and evening meetings in the Mennonite Church in Indiana 1870. It comprehends 603 members and 15 churches. (10) Die Bundes Konferenz der Mennoniten Brüdergemeinde originated in Russia 1840 and came to the United States 1873. It adheres to the practice of baptism by immersion, emphasizes the necessity of conversion as provable by plain evidence; and promotes foreign missions, notably in China, Africa, and India. Members 2,000, ministers 42. (11) The Defenseless Mennonites also lay stress on visible conversion. They are a branch of the Amish Mennonites. Members 1,200, ministers 20. (12) The Church of the Mennonite Brethren was organized in 1880. It is the most liberal of all the branches of the

MENOBANCHUS — MENSTRUATION

sect; its adherents are open communionists and indifferent as to the form of baptism. Consult: Martin, 'The Mennonites' (1883); and Krehbiel, 'The History of the General Conference of Mennonites of North America' (1895).

Menobran'chus, a genus of tailed amphibians, more properly termed *Necturus*, the single known species of which is the North American mud-puppy (q.v.).

Menocal, Aniceto G., American civil engineer: b. Island of Cuba 1 Sept. 1836. He was educated in Havana and was graduated from the Rensselaer Polytechnic Institute in 1862. In 1863-9 he was engaged as sub-chief engineer of the Havana waterworks and in 1870 returned to New York, where he was two years in the engineering of the waterworks department. He has been chief engineer of all the surveys made for the isthmian canal by the United States government and was sent to Paris in 1879 as member of the Canal Congress. He has furnished the estimates of the cost of the canal and was a member of the boards for selecting coaling stations in the Philippines, Porto Rico, and on the coast of Liberia, Africa. He is a member of several scientific societies and has published many of his official reports, etc.

Menominee, the French *FOLLES AVOINES*, a tribe of North American Indians of Algonquian stock, formerly known in upper Michigan and Wisconsin, along the Menominee River and Green Bay, and ranging west to the Mississippi, and south to the Fox River. Their name signifying "wild-rice men," hence the French translation, is derived from their use as a staple food of the abundant wild rice of the region. Their descendants in 1901 numbering 1,390, civilized and Roman Catholics, inhabit the Green Bay Reservation, Wisconsin.

Menominee, *mè-nôm'i-nê*, Mich., city, county-seat of Menominee County; at the mouth of Menominee River, on Green Bay, and on the Chicago, M. & St. P., the Wisconsin & M., and the Chicago & N. W. R.R.'s; opposite Marinette (q.v.) and about 50 miles northeast of Green Bay, Wis. The first settlement was made in 1799 by Louis Chappieu, a French fur trader. The first lumber mill was built in 1832, but the town was not incorporated until 1883. It is situated in an extensive lumbering region, and it is one of the largest lumber-shipping ports on the Great Lakes. Its chief industries are connected with the lumbering interests; the principal manufactures are lumber in all forms, paper, shoes, boxes, machinery, telephones, steam-boilers, beet-sugar, electrical machinery, and lumber-camp outfits. The city has a fine high school, public and parish schools, and a public library which contains about 5,000 volumes. It has Saint Joseph's Hospital, the county buildings, and several fine churches. The government is vested in a mayor and council elected annually. The city treasurer and the justice of the peace are elected by the people; the other administrative officers are chosen by the mayor and council. Pop. (1890) 10,630; (1900) 12,818.

Menomonee, Wis., city, county-seat of Dunn County; on the Red Cedar River, and on the Chicago, St. P., M. & O., and the Chicago, M. & St. P. R.R.'s; about 68 miles east of Saint Paul, Minn. It is in an agricultural region and near the lumber section of the State. The chief manufactures are lumber, wagons, carriages, ma-

chinery, foundry products, brick, and flour. The trade is principally in lumber, flour, fur, brick, and wheat. Menomonee is the seat of the Stout Manual Training School (q.v.) and a normal training school. It has the Mabel Tainter Memorial library, which contains about 8,500 volumes. The Dunn County Asylum is near, but outside the city limits. Pop. (1900) 5,955.

Men'opause, the cessation of menstrual flow in women; climacteric; change of life. This epoch is reached generally between the 45th and 52d years, and is frequently marked by nervous disturbances. The power of child-bearing terminates at the menopause. See CLIMACTERIC; MENSTRUATION, DISORDERS OF.

Men'opome, a giant salamander of the genus *Cryptobranchus* (formerly *Menopoma*). See HELLEBENDER.

Men'pes, Mortimer, English artist: b. Australia. He went to London when 19, studied at South Kensington; spent three years in Brittany at Pont Aven; traveled in Japan, where he learned something from Kyosai, in India, Burma and Cashmere, then through southern Europe, and in Mexico; and wherever he went continued his early experiments in color and his attempts to reproduce the atmosphere of various localities. Originally he used the color as dry as possible, then mixed it with petroleum, and finally used poppy-oil as a medium. He revived the lost art of printing in color from etched plates; made some excellent dry paint etchings, notably one of Hals' 'Archers of St. Adrian'; and published several volumes of pictures. His English house was made in the East, and is a wonderful piece of Oriental workmanship in gold and black.

Men'sa, or **Mons**, in astronomy, one of the 14 constellations which Lacaille discovered at the Cape of Good Hope. It is named from the mountain which is a conspicuous feature of the landscape at the Cape. The constellation is a very inconspicuous one near the South Pole, its brightest star being only of 5.3 magnitude.

Menstrua'tion, the discharge of the menses or bloody fluid from the female generative organs. In women it normally occurs at intervals of one lunar month, or 13 times a year (hence the use of the term *menses*, Latin plural of *mensis*, month). Its first appearance marks the stage of puberty, and is usually attended by definite changes—enlargement of the breasts, showing development of the mammary glands, growth of the ovaries, of the uterus and external genital organs, etc., and by other signs, physical and mental, of approaching womanhood and maturity. It usually begins, in temperate climes, between the 14th and 16th year, and continues its periodic recurrences until the menopause (q.v.) or final cessation of the discharge, which ordinarily arrives somewhere between the 45th and 52d years. The recurrent periods of its appearance, as well as their duration, vary with different persons, and not infrequently in the same individual; the variations, however, not always indicating abnormal or pathological causes. Menstruation is often at first, and in many persons throughout the catamenial age, attended by characteristic pains and symptoms, with physiological and psychological conditions of disturbance or depression, which sometimes call for special hygienic treatment. During pregnancy (with exceptional cases) there is no menstrual

MENSURATION

flow, its cessation being one of the earliest signs of conception. Observation of wholesome rules of exercise, rest, etc., helps to maintain normal conditions of body and mind, the reverse of which, owing to neglect of such rules, so often makes the menstrual function a visitation of dread and distress.

Disorders of Menstruation.—These include amenorrhœa, dysmenorrhœa, menorrhagia and metrorrhagia. Amenorrhœa is an absence of the menstrual flow from some cause other than pregnancy or the approach of the menopause (q.v.) or tardy establishment of the menstrual function. It is a symptom of anæmia (q.v.), or may be due to a constitutional condition such as profound nerve-fag or tuberculosis. Strychnine, iron, and ergot may be administered internally, or the physician may apply local treatment. (See DYSMENORRHEA.) Menorrhagia is an abnormally profuse flow during the menstrual period, due to one of several conditions. If not checked by rest, a physician is necessary, as also in metrorrhagia, which is a sanguineous flow between the menstrual periods.

Mensuration. Mensuration is that branch of applied mathematics which treats of the metrical relations of geometric figures, in particular of the length of lines, the magnitude of plane and solid angles, the area of surfaces, and the volume of solids. The term is used both for the act and for the art of measuring geometric magnitudes. Mensuration is not usually treated as a separate branch of mathematics, but occurs as an integral part of various subjects, such as plane geometry, solid geometry, trigonometry, and integral calculus. For a discussion of the measurement of plane, diedral, spherical, and solid angles and of the relations between the sides and angles of a triangle (plane or spherical) the reader is referred to the article on TRIGONOMETRY. The present article will give formulas for lengths, areas, and volumes of the simpler and the regular figures and methods of approximation for the more complex or irregular figures.

The measure of a geometric magnitude is its ratio to a fixed magnitude of the same kind selected as the unit of measurement. Throughout this article the unit of area is assumed to be a square each side of which is equal to the unit of length, and the unit of volume is a cube whose edges are likewise of unit length. The purpose of a formula is to show how one of these numbers (ratios) may be found from certain others which are supposed to be known or obtainable. Thus formula (XIX) says that the ratio of the area of a circle to that of a square each side of which is a foot long (that is, the area of the circle measured in square feet) may be obtained by multiplying together the ratio of the circumference to the unit of length known as a foot, the ratio of the radius to the same unit of length, and the number $\frac{1}{2}$. It is important to recognize that in using any formula the units must all be of the same system. The number of acres in a field cannot be found directly from formula (X) by multiplying together the number of rods in two adjacent sides: this would give the number of square rods in the field. Nor is the number of gallons in a barrel given by formula (LXV) when the radii are measured in feet or in inches, but the number of cubic feet or cubic inches, as the case

may be. In order to change any measure from one system of units to another, the following table may be found useful

To change		Multiply by	Inverse.
in.	to cm.	2.53998	.393704
ft.	to m.	.304797	3.28087
miles	to km.	1.60933	.621377
sq. in.	to sq. cm.	6.45148	.155003
sq. ft.	to sq. m.	.0929013	10.7641
sq. ft.	to acres.	.0000229568	43560.
sq. yds.	to acres.	.000206612	4840.
sq. miles	to acres.	640.	.0015625
cu. in.	to cu. cm.	16.3866	.0610254
cu. ft.	to litres.	28.3167	.0353156
cu. in.	to gallons.	.004329	.231
cu. ft.	to gallons.	.000264184	3785.235

[in.=inches, ft.=feet, yds.=yards, sq.=square, cu.=cubic, m.=metres, cm.=centimetres, km.=kilometres.]

For other multipliers see WEIGHTS AND MEASURES. The second column of figures serves to change the unit in the opposite way to that indicated by the rest of the table: thus to change meters to feet multiply the number of meters by 3.28087; for instance, 10 meters is equal to 32.8087 feet.

In many cases the computation of area or of volume may be accomplished most easily by mechanical means. For the measurement of the area of plane figures ingenious and effective instruments known as planimeters have been invented. Two historic instances are the finding by Galileo of an approximate value for the area of a cycloid by cutting it out of a sheet of copper and weighing the model, and the discovery by Archimedes of a fraud in Hiero's new crown through measuring its volume by submersing it in water and measuring the water displaced. To apply this last method, multiply the number of ounces of water by 1.73, or less accurately by $\frac{1}{4}$, and the result will be the number of cubic inches in the object; or, measure directly the volume of the water displaced.

LENGTH OF LINES.

Circle.—The circumference of a circle is equal to the diameter multiplied by

$$3.14159265358979323846264338328 \dots$$

This constant is usually denoted by the Greek letter π (pi) and is approximately equal to

$$3\frac{1}{7}, \frac{22}{7}, \text{ or } 3.1416.$$

Use the first if an error of one two-thousandth of the final result may be neglected, and the last if an error of one four-hundred-thousandth is negligible.

The above theorem may be written

$$\begin{aligned} l &= \pi d, \\ &= 2\pi r, \end{aligned} \quad (I)$$

where l =length of circumference, d =diameter, and r =radius.

The length l of the arc AMB in Fig. 1, in which MD is the perpendicular at the middle point of the chord AB , AE is tangent to the circle at A or perpendicular to the radius OA , OE is perpendicular to AM , the chord of half the arc or the angle AOE is one fourth of the

MENSURATION

angle AOB , may be found by any one of the formulas

$$l = \frac{\pi}{180} dr, \quad \frac{\pi}{180} = \frac{1}{57} \quad (\text{error about } \frac{1}{250}) \quad (\text{II})$$

$$l = c + \frac{8}{3} \frac{h^2}{c}, \quad (\text{III})$$

$$l = 2k + \frac{1}{3}(2k - c), \quad (\text{IV})$$

$$= \frac{1}{3}(8k - c),$$

$$l = t + s, \quad (\text{V})$$

in which d =number of degrees in the angle AOB , r =radius OA , c =chord AB , h =height MD , k =chord of half the arc AM , t =length

FIG. 1.

of AE , and s =length of BE . Formulas (III), (IV), and (V) are only approximate, the error being small only if the angle AOB or the ratio of h to c is small. Thus for an angle of $d=90^\circ$ the arc is 1.5708..., whereas formulas (III), (IV) and (V) give 1.576..., 1.5696..., 1.5732..., respectively.

FIG. 2.

Parabola.—The length l of the arc AVB of the parabola in Fig. 2 is

$$l = \sqrt{y^2 + 4x^2} + \frac{y^2}{2x} \left(\log \frac{2x + \sqrt{y^2 + 4x^2}}{y} \right) \dots, \quad (\text{VI})$$

where $x=VD$, $y=AD$, and the logarithm is taken to the base e .

Ellipse.—The length l of the circumference $ABA'B'$ of ellipse in the next figure (Fig. 3), in which F and F' are the foci ($BF=BF'=OA$), is

$$l = 2\pi a \left(1 - \frac{1}{4}e^2 - \frac{3}{64}e^4 - \frac{5}{256}e^6 \dots \right), \quad (\text{VII})$$

or approximately

$$l = \pi \sqrt{2(a^2 + b^2)} \quad (\text{VIII})$$

$$= 4.443d;$$

where e is the eccentricity $\left(OF/OA = \frac{1}{a} \sqrt{a^2 - b^2} \right)$;

$a=OA$, one half the longest diameter; $b=OB$, one half the shortest diameter; $d=AB = \sqrt{a^2 + b^2}$.

FIG. 3.

General Methods of Approximating the Length of Any Curved Line.—Divide the line into parts each of which differs but little from a small circular arc. Then each portion may be found by any one of the formulas (III), (IV), or (V). A convenient method for the use of formula (IV) is indicated by the following diagram (Fig. 4) and formula (IX). The only restrictions upon the location of the points 1, 2, 3, 4, ... in addition to that given above is that the odd-numbered ones must be half-way between the others and that there should be an odd number of points in all.

FIG. 4.

$$l = (\overline{A1} + \overline{12} + \overline{23} + \dots) + \frac{1}{4}[(\overline{A1} + \overline{12} + \overline{23} + \dots) - (\overline{A2} + \overline{24} + \overline{46} + \dots)], \quad (\text{IX})$$

AREA OF PLANE FIGURES.

Rectangle.—The area a of a rectangle, the lengths of two adjacent sides of which are b and c respectively, is

$$a = bc. \quad (\text{X})$$

Triangle.—The area a of the triangle ABC (Fig. 5) is

$$a = \frac{1}{2}hb, \quad (\text{XI})$$

$$a = \frac{1}{2}bc \sin A, \quad (\text{XII})$$

$$a = \sqrt{s(s-a')(s-b)(s-c)}, \quad (\text{XIII})$$

or

$$a = \frac{1}{2}b^2 \frac{\sin A \cdot \sin C}{\sin(A+C)}; \quad (\text{XIV})$$

where a' , b , c are the lengths of the sides BC , CA , AB , respectively; h is the perpendicular distance (height) of B from AC ; s is one half of the sum of the sides: $s = \frac{1}{2}(a' + b + c)$.

If one angle of the triangle (say A) is a right angle, both formulas (XI) and (XII) simplify: namely, the area is one half the product of the two

MENSURATION

sides which enclose the right angle ($a = \frac{1}{2}bc$). For a simple method of finding the area of an equilateral triangle ($a' = b = c$) multiply the square on one side by $\frac{\sqrt{3}}{4}$ ($a = \frac{\sqrt{3}}{4}b^2$, approximately), see formula (XVIII).

FIG. 5.

Parallelogram.—The area a of the parallelogram $ABED$ (Fig. 5) is

$$a = d \cdot h, \quad (\text{XV})$$

or

$$a = cd \sin D, \quad (\text{XVI})$$

where c and d are the lengths of two adjacent sides, D is the angle between them, and h is the perpendicular distance between the two parallel sides whose length is d .

Trapezoid.—The area a of the trapezoid $CBED$ (Fig. 5), any four-sided figure with two of the opposite sides (BE and DC) parallel, is

$$a = \frac{1}{2}h(d + e), \quad (\text{XVII})$$

where h is the perpendicular distance between the two parallel sides and d and e are the lengths of the parallel sides ($d = BE$, $e = DC$).

Regular Polygon.—The area a of a polygon bounded by n equal sides each of length s and having its n angles all equal is

$$a = s^2 \times \frac{n \cot \frac{180^\circ}{n}}{4}. \quad (\text{XVIII})$$

The following table gives (approximately) the value of the multiplier in the simpler cases

Name.	n	$\frac{n \cot \frac{180^\circ}{n}}{4}$
Triangle.....	3	.433013
Square.....	4	1.
Pentagon.....	5	1.72048
Hexagon.....	6	2.59808
Heptagon.....	7	3.03301
Octagon.....	8	4.82843
Nonagon.....	9	6.18182
Decagon.....	10	7.69421
Undecagon.....	11	9.36564
Dodecagon.....	12	11.19615

Thus, for instance, if the side of a regular hexagon be 9 feet, its area is $81 \times 2.59808 = 210.4445$.

Irregular Polygon.—The area of an irregular polygon may be found by dividing it into parts each of which is a triangle, parallelogram, rectangle, or trapezoid. Thus if we draw a system of parallel lines across the polygon, one through each vertex, each part will be a triangle or trapezoid, and its area may be found by formulas (XI) or (XVI).

Circle.—The area a of a circle, whose radius is r and whose circumference is l , is

$$a = \frac{1}{2}lr, \quad (\text{XIX})$$

or

$$a = \pi r^2. \quad \pi = 3.1416 = \frac{22}{7} \quad (\text{nearly}). \quad (\text{XX})$$

The area a of the sector $OAMB$ (Fig. 1), in which l is the length of the arc AMB and d is number of degrees in the angle AOB , is

$$a = \frac{1}{2}lr, \quad (\text{XXI})$$

$$\text{or } a = \frac{\pi}{90} dr, \quad \frac{\pi}{90} = .034906585 = \frac{1}{286} \quad (\text{nearly}).$$

The area a of the segment $AMBD$ (Fig. 1) is

$$a = \frac{1}{2}r(l - r \sin d^\circ), \quad (\text{XXII})$$

$$a = \frac{1}{2}ch + \frac{h^3}{2c} \quad (\text{approximately}), \quad (\text{XXIII})$$

$$\text{or } a = \frac{1}{2}ch \quad (\text{approximately}), \quad (\text{XXIV})$$

where r , l , c , h , d have the same meanings as in formulas (II), (III), (IV), and (V).

Parabola.—In Fig. 2 the area a of the segment $VABD$ with base $AB = 2y$ and height $VD = x$ is

$$a = \frac{2}{3}xy. \quad (\text{XXV})$$

Ellipse.—In Fig. 3 the total area a' of the ellipse $ABA'B'$, of which the length of the longest diameter $A'A$ is $2a$ and the length of the shortest diameter $B'B$ is $2b$, is

$$a' = \pi ab, \quad \pi = 3.1416 \quad (\text{XXVI})$$

General Methods of Approximation.—Any plane area can be divided into parts each of which is a rectangle or differs from a rectangle in that one side is a simple curve as in Fig. 6. It is therefore sufficient to give methods by which an area, such as $ABB'A'$ below, may be measured.

FIG. 6.

1. **The Trapezoidal Method.**—Divide the base line AB into any number of equal parts, AP , PQ , QR , ..., TB and erect the perpendiculars PP' , QQ' , ..., TT' . Then if each portion $A'P'$, $P'Q'$, ..., $T'B'$ of the curve $A'B'$ is nearly coincident with its chord, the area a is

$$a = \overline{AP}(\overline{AA'} + \overline{PP'}) + \overline{PQ}(\overline{P'Q'} + \overline{QQ'}) + \dots + \overline{TT'}(\overline{TT'} + \overline{BB'})]. \quad (\text{XXVII})$$

2. **Simpson's Rule.**—Divide the base line into any even number of parts (in Fig. 6 it is divided into six parts); erect the perpendiculars as before. Then

$$a = \frac{1}{3}\overline{AP}[\overline{AA'} + \overline{BB'} + 2(\overline{QQ'} + \overline{SS'} + \dots) + 4(\overline{PP'} + \overline{RR'} + \overline{TT'} + \dots)] \quad (\text{XXVIII})$$

3. **Weddle's Rule.**—Divide the base into exactly six equal parts (as in Fig. 6), then

$$a = \frac{1}{40}\overline{AB}[5(\overline{PP'} + \overline{RR'} + \overline{TT'}) + \overline{RR'} + \overline{AA'} + \overline{QQ'} + \overline{SS'} + \overline{BB'}]. \quad (\text{XXIX})$$

MENSURATION

SURFACE AND VOLUME OF SOLIDS.

Prism.—This includes any solid two of whose faces, known as the *bases*, are equal polygons situated in parallel planes and all the other faces, the *lateral faces*, are parallelograms. Thus in the following diagram (Fig. 7) the polygons $ABC\dots$ and $A'B'C'\dots$ are the bases and the parallelograms $AA'B'B$, $BB'C'C$, $CC'A'A$ are the lateral faces. The edges AA' , BB' , CC' , $\dots$ are the lateral edges. The polygon $UVW\dots$ lying in a plane perpendicular to one, and so to all, of the lateral edges is called a *right section*. The right section is equal to the base if and only if the lateral edges are perpendicular to the base

FIG. 7.

For the lateral area a which is the sum of the lateral faces $AA'B'B$, $BB'C'C$, $\dots$, and the volume v of a prism we have the formulas

$$a = e(\overline{UV} + \overline{VW} + \dots), \quad (\text{XXX})$$

$$v = es, \quad (\text{XXXI})$$

$$v = hb, \quad (\text{XXXII})$$

in which e = length of a lateral edge (AA' or BB' , $\dots$), s = area of a right section ($UVW\dots$), h = height, *i.e.*, distance between bases, b = area of a base.

The volume v of a *truncated triangular prism*, that is one with three lateral faces and whose bases are not parallel (therefore the lengths e_1 , e_2 , e_3 of the lateral edges not equal), is

$$v = \frac{1}{3}s(e_1 + e_2 + e_3). \quad (\text{XXXIII})$$

Any *truncated prism* may be divided into truncated triangular prisms and its volume thus found. For a four-sided prism whose opposite lateral faces are parallel this gives

$$v = \frac{1}{2}(e_1 + e_3)s, \quad (\text{XXXIV})$$

where e_1 , e_3 are a pair of opposite edges.

Cylinder.—This includes any solid having two bases which are equal plane figures bounded by curved lines (such as circles, ellipses, or irregular figures), and situated in parallel planes, and the rest of the surface of the solid such that it may be thought of as consisting of an infinite number of parallel straight lines. If we call the length of each of these (equal) parallel lines e , the formulas for the prism given above (XXX, XXXI, XXXII) apply also to the cylinder, namely, the lateral area a and the volume v are

$$a = ep, \quad (\text{XXXV})$$

$$v = es, \quad (\text{XXXVI})$$

$$v = hb, \quad (\text{XXXVII})$$

where p is the length of the boundary, and s is the area of the section of the cylinder by a

plane perpendicular to one of the lines lying on the lateral surface.

If the right section of a cylinder be a circle, the base, unless a circle, is an ellipse and its area is found by formula (XXVI). If in such a circular cylinder the bases are not parallel and the distance between the centers of the bases is l , then the area a and the volume v are

$$a = lp, \quad (\text{XXXVIII})$$

$$= 2\pi rl, \quad (\text{XXXIX})$$

$$v = ls, \quad (\text{XL})$$

$$= \pi r^2 l, \quad \pi = 3.1416, \quad (\text{XLI})$$

where r is the radius of the right section. These formulas are equivalent to (XXXV) and (XXXVI) when the bases are parallel, since then $l = e$.

Pyramid and Cone.—The volume v of any solid, such as those in Fig. 8, whose surface

FIG. 8.

consists of a base, which is a plane figure of any kind, triangle, polygon, circle, ellipse, etc., and of triangles or curved areas which may be thought of as composed wholly of straight lines, joining the boundary of the base to some point (the vertex) not in the same plane as the base, is

$$v = \frac{1}{3}bh, \quad (\text{XLII})$$

where b is the area of the base and h is the perpendicular distance (height) of the vertex from the plane of the base.

For a right circular cone, that is one in which the base is a circle and the line joining the vertex to the centre of the base is perpendicular to the plane of the base, the area a of the curved (lateral) surface is

$$a = \pi re, \quad \pi = 3.1416, \quad (\text{XLIII})$$

where r is the radius of the base and e is the distance from the vertex to any point in the circumference of the base.

Prismatoid.—The volume v of any solid, whose total surface consists of two plane figures (the bases), of any character whatever, lying in parallel planes, and a lateral surface made up of triangles, trapezoids, or curved portions which may be thought as made up of straight lines joining the boundaries of the bases, is

$$v = \frac{1}{6}h(b_1 + b_2 + 4m), \quad (\text{XLIV})$$

where h is perpendicular distance (height) between the bases, b_1 and b_2 are the areas of the bases, and m is the area of a section of the solid by a plane parallel to and half-way between the planes of the bases; or

$$v = \frac{1}{4}h(b + 3q), \quad (\text{XLV})$$

where b is one of the bases and q is the area of a section parallel to, and two-thirds of the way from, that base to the other.

Solids of Revolution. Sphere.—The area s of the surface and the volume v of a sphere of radius r are

MENSURATION

$$s = 4\pi r^2, \quad 4\pi = 12.56637 \dots \quad (\text{XLVI})$$

$$v = \frac{4\pi}{3} r^3, \quad \frac{4\pi}{3} = 4.18879 \dots \quad (\text{XLVII})$$

The volume v and lateral area a of a *segment* of a sphere (that is the part lying between two parallel planes) are

$$v = \frac{\pi}{6} h [h^2 + 3(r_1^2 + r_2^2)], \quad \frac{\pi}{6} = .5236 \dots \quad (\text{XLVIII})$$

$$a = 2\pi hr, \quad (\text{XLIX})$$

where h is the height of the zone (perpendicular distance between the parallel planes of the bases), r_1 and r_2 are the radii of the bases respectively, r is the radius of the sphere.

Spheroid.—For a *prolate* spheroid, that is the solid formed by revolving an ellipse about its longest diameter (in Fig. 3, about AA'), the area s of the surface and the volume v are

$$s = 2\pi \left(b^2 + \frac{ab}{e} \sin^{-1} e \right), \quad (\text{L})$$

$$\text{or} \quad s = 2\pi b (b + fa), \quad (\text{approximately,}) \quad (\text{LI})$$

where a , b , and e have the same significance as in (VII) and (VIII) and

$$f = 1 + \frac{1}{10}c^2 + \frac{8}{15}c^3 + \frac{1}{15}c^4 + \frac{68}{2835}c^5 + \dots,$$

in which $c = 1 - \frac{b^2}{a^2}$. Or less accurately

$$s = \frac{\pi b}{3} \left[7a + b \left(6 - \frac{b}{a} \right) \right], \quad \frac{\pi}{3} = 1.0472; \quad (\text{LII})$$

$$v = \frac{4\pi}{3} ab^2, \quad \frac{4\pi}{3} = 4.18879 \dots \quad (\text{LIII})$$

The volume v of a *segment* of a prolate spheroid (part cut off by a plane perpendicular to the axis of revolution) the height of which is h , is

$$v = \frac{\pi h^2 b^2}{3 a^2} (3a - h), \quad \frac{\pi}{3} = 1.047198 \dots \quad (\text{LIV})$$

For an *oblate* spheroid, that is the solid formed by revolving an ellipse about its shortest diameter (in Fig. 3, about BB') the corresponding formulas are

$$s = \pi \left(2a^2 + \frac{b^2}{e} \log \frac{1+e}{1-e} \right), \quad (\text{LV})$$

$$\text{or} \quad s = 2\pi (a^2 + gb^2), \quad (\text{LVI})$$

where

$$g = 1 + \frac{1}{3}d + \frac{1}{6}d^2 + \frac{1}{8}d^3 + \frac{1}{6}d^4 + \frac{1}{12}d^5 + \dots,$$

in which

$$d = 1 - \frac{b^2}{a^2};$$

$$v = \frac{4\pi}{3} ba^2, \quad \frac{4\pi}{3} = 4.18879 \dots \quad (\text{LVII})$$

The volume v of a *segment* of an oblate spheroid is

$$v = \frac{\pi h^2 a^2}{3 b^2} (3b - h). \quad (\text{LVIII})$$

Paraboloid.—The volume v of the solid formed by revolving VAD in Fig. 2 about VD as an axis is

$$v = \frac{\pi}{2} xy^2, \quad \frac{\pi}{2} = 1.5708 \dots, \quad (\text{LIX})$$

which is just one-half the volume of the circumscribing cylinder.

The General Solid of Revolution.—The volume v of the solid formed by revolving any curve about a line lying in the same plane and not intersecting it, for instance by revolving $A'B'BA$ in Fig. 6 about AB as an axis, is

$$V = \frac{\pi}{3} \cdot \overline{AP} [AA'^2 + BB'^2 + 2(\overline{QQ'}^2 + \overline{SS'}^2 + \dots) + 4(\overline{PP'}^2 + \overline{RR'}^2 + \dots)]. \quad (\text{LX})$$

Or, as it is perhaps usually easier to measure the circumferences of the circles generated by PP' , etc., than their diameters, if we denote the circumferences generated by $A', P', Q', \dots, B'$ by $a, p, q, \dots, b$, respectively, the above formula may be written

$$v = \frac{\pi}{12\pi} \cdot \overline{AP} [a^2 + b^2 + 2(q^2 + s^2 + \dots) + 4(p^2 + r^2 + \dots)],$$

$$\frac{1}{12\pi} = .0265258 \dots \quad (\text{LXI})$$

The Regular Solids.—The area of the surface and the volume of the five regular solids may be found by means of the multipliers given in the following table:

Name.	Area = (edge) ² ×	Volume = (edge) ³ ×	(LXII)
Tetrahedron. . .	1.7320508	.1178511	
Cube,	6.	1.	
Octahedron. . .	3.4641016	.4714043	
Dodecahedron. .	20.6457788	7.6631180	
Icosahedron. . .	8.6602540	2.1816950	

General Method.—The volume of solids which do not come under any of the types treated above may be measured by an application of the prismatoidal formula (XLIV). Let $a_1, a_2, a_3, \dots, a_n, a_{n+1}$ be the areas of a set of plane sections parallel to a suitably chosen base and dividing the solid into an even number ($2n$) of portions; a_1, a_{n+1} being the end sections (that is the solid lies wholly between a_1 and a_{n+1}). The distance between consecutive cutting planes is to be the same throughout and to be taken so small that between the odd-numbered sections the solid is approximately a prismatoid. The area of a section may be found by surrounding it by a rectangle and measuring (by XXVII, XXVIII, or XXIX) the portion of the rectangle outside of the section. If the distance between the sections be h , then

$$v = \frac{1}{2} h [a_1 + a_{2n+1} + 2(a_3 + a_5 + a_7 + \dots + a_{2n-1}) + 4(a_2 + a_4 + a_6 + \dots + a_{2n})]. \quad (\text{LXIII})$$

Barrel.—If d be the inside diameter of the end of a barrel, c the inside diameter at the middle, and l the length (or height) of the barrel, then the prismatoidal formula (XLIV) gives as the volume v

$$v = \frac{\pi}{6} l \left(\frac{d^2}{2} + c^2 \right), \quad \frac{\pi}{6} = .5236. \quad (\text{LXIV})$$

The following is said to be a better approximation:

$$v = \frac{\pi}{9} l \left(d^2 + \frac{5}{4} c^2 \right), \quad \frac{\pi}{9} = .349 \dots \quad (\text{LXV})$$

The volume v of the smaller portion of a partly filled barrel, that is of the contents if the barrel is less than half full and of the empty portion if it is more than half full, is

$$v = .000472h(d^2 + a^2 + 4b^2), \quad (\text{LXVI})$$

where h is the distance of the surface of the contents from the nearest end, a is the diameter at the surface of the contents, and b is the diameter half-way between the surface and the nearest end.

WILLIAM FINDLAY,
Instructor in Mathematics, Columbia University.

Mental Science, an individualistic religious and philosophical belief numbering upward of 500,000 persons in the country who are followers of various beliefs, known as Divine Science, Divine Healing, Spiritual Ethics, Metaphysical Science and other titles. There is no organization of these owing to the variety of belief prevalent among them. Hence mental science stands for no definite set of dogmas; it differs materially from Christian Science (q.v.), in so much as the latter is based on the belief in Christ. A mental scientist bases his belief on the physical powers of the mind, without reference to anything Divine. Mental Science believes in the dominant power of mind over matter and in the cure of all diseases by purely mental effort.

Mentchikof, Alexander Danielovitch, Russian soldier and statesman: b. Moscow 6 Nov. 1672; d. Berezov, Siberia, between November 1729 and February 1730. He was of obscure parentage, but succeeded in entering the service of Prince Lefort, the favorite of Peter the Great, later discovering and thwarting a conspiracy against his patron's life. After serving in the campaign of Azof, he accompanied the czar on his trip through Holland and England, and on the death of Lefort became his chief adviser. He was created field-marshal and prince by Peter, and prince of the German empire by Leopold I., and during the absences of the czar acted as regent. During the campaign of 1706 he defeated the Swedes at Kalish, and in 1709 was largely instrumental in securing the victory over Charles XII. at Pultowa. In 1710, as commander of the Russian forces in the north, he took Riga, occupied Pomerania and Holstein, and conquered Stettin. His arbitrary acts, however, finally resulted in his court-martial by Peter, though the death sentence was commuted to fine. He was one of the principal factors in the accession of Catharine I. to the throne (1725-7), and till her death was all powerful, and even after Peter II. succeeded to the throne he had absolute control of the government. He was about to marry his daughter to the young czar when he was suddenly overthrown by Dolgoruki (September 1727) and banished to Siberia.

Menthene, mên'thên, a colorless hydrocarbon oil having the formula $C_{10}H_{18}$, and obtained by dehydrating menthol ($C_{10}H_{16}O$) by the action of strong sulphuric acid, or by distilling it with zinc chloride or phosphorus pentoxide. It has a specific gravity of about 0.81 and boils at 333° F. It does not mix with water, but is moderately soluble in alcohol and in ether, and dissolves in benzene, turpentine, or petroleum.

Men'thol (peppermint-camphor), a brilliant white crystalline substance separated from the essential oil of mint (*Mentha*). It is obtained from official (also from Chinese and Japanese) oil of peppermint. Like thymol, menthol has considerable antiseptic power. It is chiefly used combined with chloroform and oils as a liniment for the relief of pain, or locally in the form of pencils as a remedy for neuralgic headache. Sometimes menthol is used internally in solution for relief from nausea, flatulence, and colic, but it is more apt to excite inflammation of the stomach and intestines than the milder preparations of peppermint.

Mentone, mên-tō'nê (Fr. MENTON, môn-tôn), France, a seaport town and health resort on the Mediterranean, in the department of Alpes-Maritimes, near the Italian frontier, and 19 miles by rail northeast of Nice. It is charmingly situated on a promontory about the middle of a bay five miles in circuit, encircled by abruptly rising hills. The ancient walls of the feudal town are still standing, and there the streets are dark and crooked. The new part of the town, with numerous fine villas, stretches along the base of the hill on which the old part is situated, parallel to the sea. The climate of Mentone is mild and equable; it is rare that the thermometer descends as low as the freezing point, or rises higher than 30° C. (86° F.), hence making Mentone a favorite resort for persons in delicate health. There is a considerable trade in fruit, in flowers, and leaves used in the manufacture of perfumes, and in olive-oil. The town of Mentone belonged to the principality of Monaco from 1346 to 1860, but in the latter year was ceded to France. In the vicinity, but on Italian territory, are the grottoes of Baoussé Rousse, popularly known as the Caves of Mentone, famous for the valuable evidences of prehistoric man that they have yielded. Pop. (1901) 14,913.

Men'tor, according to Greek legend, the faithful friend of Ulysses, who entrusted to him the care of his domestic affairs during his absence in the war against Troy. The education of the young Telemachus fell to his charge, and when the latter set out on his voyage in search of his father Minerva accompanied him under the form of Mentor (Odyssey, ii. 390; iii. 12, etc.), acting the part of a prudent and experienced counsellor to the young hero. This character of a sage adviser is more fully developed in the *Télémaque* of Fénelon, in which Mentor plays a conspicuous part.

Menzaleh, mên-zā'lê, or **Menzala**, Egypt, a large lake or lagoon extending from Damietta to the Suez Canal, and running parallel with the Mediterranean, from which it is divided by a narrow slip of land, from 2 to 12 miles in breadth. Length of the lake from northwest to southeast, about 38 miles; breadth, about 20 miles. It receives the Pelusiac and Tanitic branches of the Nile, and communicates with the sea by three openings called Dibeh, Gemileh, and Om Farejeh. The lake is of comparatively recent origin, and covers what was a fruitful district of the delta, having formed through neglect of the dams. There is a small town of the same name on the south side of the lake. The Suez Canal runs along its eastern edge from north to south.

Menzel, mên'zêl, **Adolf Friedrich Erdmann von**, German artist: b. Breslau 8 Dec. 1815; d. Berlin 9 Feb. 1905. In 1830 his parents settled in Berlin, where his father had a lithographic studio, and where the son studied a little in the Academy and more by himself. At 18 he published a cycle of lithographs called 'An Artist's Wanderings,' which immediately attracted attention; four years later he had begun to draw historical scenes from the past of Brandenburg and had commenced painting in oils with 'Checker-Players' (1836) and 'Judgment' (1837). About the same time his work as an illustrator opened up with the 400 pictures

for Kugler's 'Frederick the Great' (1840), in which Menzel showed himself original, dramatic, and historically correct. This vein he followed out in his 200 illustrations for the 'Works' of Frederick the Great, and in 600 more accompanying a work on the army of Frederick the Great (1856); as well in his oil paintings, a dozen or more, of various scenes in Frederick's life. A trip to Paris in 1867, so the French critics claim, worked a change in Menzel's methods, so that he applied himself more to problems of light and shade. After 1890 he used color less and less and in his pencil drawing broke away from mere line to the use of a cloudy treatment. He was one of the greatest of German artists of his day; and in 1899 he received the Order of the Black Eagle, conferring hereditary nobility. Apart from his historical pictures, mention should be made of the 'Modern Cyclops' (1875), the interior of a Silesian rolling mill, with excellent lights, and of social satires like 'Carnival Morning' (1885). Consult Jordan, 'Das Werk Adolf Menzels' (1895); and lives by Sondermann (1895), and Knackfuss (1897).

Menzel, Wolfgang, German author: b. Waldenburg, Silesia, 21 June 1798; d. Stuttgart 23 April 1873. He studied at Jena and Bonn, became a follower of F. L. Jahn and the Turnerei, and was for four years schoolmaster at Aarau in Switzerland. In 1825 he returned to Germany, having already made himself known to the literary world by his 'Elastic Verses' (1823). He edited and contributed to magazines, and wrote a very great number of works, poems, romances, histories, criticisms, political polemics, and Christian theology. From 1826 to 1848, and again later, he was editor of the 'Litteraturblatt' in Stuttgart. His chief writings include histories of Germany (1825), German literature (1827), German poetry (1858), Europe (1853-57), and the world ('Universal History' 1862-72). He also produced a work of mythological research (1842), a book on the pre-Christian doctrine of immortality (1869), and autobiographical memoirs (1876). He was often involved in controversy, assailing with equal zeal theological rationalists and political radicals. His attacks upon Goethe and other authors were fully equalled for virulence by the criticisms upon Menzel himself, made by Heine and some of the younger German writers.

Mephistopheles, mēf-īs-tōf'ē-lēz, a name for the devil, which has been made popular by Goethe's 'Faust.' Goethe derived it from an old popular legend, in which it is spelled *Mephistophiles* or *Mephistophilis*. The etymologies of the word are as various as the spelling. Some suppose it to be an irregularly formed Greek compound from the negative *mē*; *phōs*, light; and *philos*, loving, thus signifying "not loving the light." Others surmise that it may be derived from the Latin *mephitis* and the Greek *philos*, in which case it will signify literally "loving the mephitic vapors of hell." The Mephistopheles of Goethe has little in common with the devil of the popular imagination. He appears, especially in the original form of the drama of Faust, as a real man of flesh and blood, who only preserves those traits of the popular devil of the Middle Ages which are compatible with a true human individuality—as the companion of Faust, as a selfish and malevolent votary of pleasure, always looking to the real,

and bringing back Faust by cold and heartless irony, from barren speculation to the enjoyment of the present life.

Meran, mǎ-răn', Austria, a celebrated health resort in Tyrol, charmingly situated on the river Passer, near its entrance into the Adige, at the foot of a hill called the Küchelberg. It consists of an old and a new town, the latter with handsome villas and hotels, and numerous fine residences and old castles in the neighborhood. Lying in a sheltered situation on the southern slope of the Alps, it possesses a mild and equable climate, and is much frequented in winter by invalids with pulmonary affections. Pop. (1900) 9,284, with suburbs 17,951.

Mercadante, Saverio, sǎ-vǎ-rē-ō mēr-kā-dăn'tǎ, Italian composer: b. Albamura 26 June 1797; d. Naples 17 Dec. 1870. He studied music at the college of S. Sebastiano in Naples under Zingarelli. From flute and violin he turned to vocal music; won great success with a cantata 'L'Unione delle Belle Arti' in 1818, and with an opera 'L'Apoteosi d'Ercole' in 1819; was made chapel-master of the Novara Cathedral (1833) and director of the Naples Conservatory (1840); and in 1862 became totally blind. He wrote many masses and other ecclesiastical music, such as 'The Seven Last Words'; but is best known for his operas, of which the following, out of a total of 50, should be mentioned: 'Elisa e Claudio,' 'Il Bravo,' 'Il Giuramento,' 'I Briganti,' and 'Le due illustri Rivali.'

Mer'cantile Agency, an American business and detective enterprise; an incorporated company which agrees to furnish subscribers who pay a yearly fee, with information as to the responsibility, financial standing and property interests of private individuals, or firms or corporations. The mercantile agency sometimes makes a business of collecting debts and bills of account. The business originated in the United States in 1837, following the financial panic of that year. Lewis Tappan was the founder of the first enterprise of this character in New York city. Consult: Errant, 'The Law Relating to Mercantile Agencies' (1889); Reinhard, 'A Treatise on the Law of Agency' (1902).

Mercap'tans (Latin, "taking up mercury"), or **Thio-Alcohols**, in chemistry, a large class of substances having the same constitution as the alcohols, but differing from them by having the oxygen atom in the hydroxyl replaced by sulphur. They are oily liquids or crystalline solids having an offensive, garlic-like odor, and are all insoluble in water. They possess acid tendencies that are more marked than those of the alcohols, and combine with metallic oxides to form salts which are known as "mercaptides." They combine with especial facility with mercuric oxide, and take their name from this circumstance. Ethyl mercaptan is the best known member of the series, and it is this substance that is understood when "mercaptan" is spoken of, without further qualification. Ethyl mercaptan, C_2H_5SH , is prepared by acting upon ethyl chloride, C_2H_5Cl , with potassium hydrosulphide, HKS ; the potassium atom and the ethyl radical changing places as indicated by the equation $C_2H_5Cl + HKS = C_2H_5SH + KCl$. Ethyl mercaptan is a colorless, mobile, liquid, boiling at 90° F. It is very inflammable, burning with a blue flame, and it mixes readily with

alcohol and ether, though only to a very slight extent with water. Like the other mercaptans, it forms salts with the oxides of the metals, the hydrogen atom that is associated with the sulphur being the one that is replaced by the metal. The mercury salt, $\text{Hg}(\text{S.C}_2\text{H}_5)_2$, may be prepared very readily by agitating the mercaptan (or its alcoholic solution) with red oxide of mercury, HgO . Its formation is attended by the liberation of considerable quantities of heat, and the mercaptide itself is obtained in the form of soapy white scales. All of the metallic mercaptides are decomposed by hydrochloric acid. The mercaptans of fatty radicals all give a fine green color when treated with a solution of isatin in strong sulphuric acid and this reaction (as well as their insufferable smell) is used as a test for their presence.

Mercator, mēr-kā'tōr, **Gerardus** (Latinized form of GERHARD KREMER), Flemish mathematician and geographer: b. Rupelmonde, Flanders, 5 March 1512; d. Duisburg 2 Dec. 1594. He studied at Louvain, and became a lecturer on geography and astronomy, making his instruments with his own hands. Recommended to Charles V., Mercator entered into the emperor's service, and executed for him a celestial globe of crystal, and a terrestrial globe of wood. In 1559 he retired to Duisburg, and received the title of cosmographer to the Duke of Juliers. His last years were devoted to theological studies. He is known as the inventor of a method of projection called by his name, in which meridians and parallels of latitude cut each other at right angles, and are both represented by straight lines, which has the effect of enlarging the degrees of latitude as they recede from the equator. His first maps on this projection were published in 1569; the principles were first explained by Edward Wright, in 1599, in his 'Corrections of Errors in Navigation,' whence the discovery has sometimes been attributed to him. His 'Tabulæ Geographicae' (1578) is the best edition of the maps of Ptolemy. See MAP.

Mercator's Chart or Projection. See CHART.

Mercedas, mēr-sā'dās, **Argentina**, town, in the province of Buenos Ayres, on the Pacific railroad; about 40 miles west of the city of Buenos Ayres. In 1779 it was founded as a military station. An Irish colony settled here about 1800. Mercedas is in a region where the chief occupation is raising sheep and cattle. It has several manufacturing establishments, among which are flour-mills, soap factories, and cattle-yards. The shipments are principally wool, hides, and flour. The town has a public library and a college. Pop. about 11,000.

Mer'cenaries, or Stipendiaries, foreigners or others who received pay for their services as soldiers, especially as distinguished from government soldiers or those owing military service to the crown or nation. Hired professional soldiers appear very early in the history of military organization. Foreign mercenaries appear in the armies of Alexander the Great and the Romans. They were common in all armies, but generally engaged for a single campaign only. In England, Harold had a body of Danes in his army when he defeated the Norwegian king—the hus-carls, a body originally established by Canute. William III. had for some time a body of Dutch troops in his pay after he

became king of England; and throughout the 18th century Hessian and Hanoverian regiments were constantly in the pay of the British government for temporary purposes. Hessians fought for Great Britain in the Revolutionary War; and the landgrave of Hesse, who sold his troops at so much a head, received upward of \$2,500,000 for Hessian soldiers lost in that struggle. Americans have fought as hired soldiers in China, South Africa, and in nearly all the countries of Central and South America. They are generally known as "soldiers of fortune." Most of the officers in the regular Chinese army are either Englishmen or Americans. But most famous of all mercenaries were the Swiss soldiers, who were hired, sometimes by the cantons themselves, over all Europe, and formed many famous body guards. They were long employed by the French monarchs; and the Vatican at Rome still has its Swiss guards.

Mercer, mēr'sēr, **Henry Chapman**, American anthropologist: b. Doylestown, Pa., 24 June 1856. He was graduated from Harvard in 1879, where he was curator in 1894-7. In 1893-7 he was anthropological editor of the 'American Naturalist.' He has made extensive investigations and studies in anthropology in America, discovering several new extinct species, and has written: 'Lenape Stone' (1885); 'Researches Upon the Antiquity of Man in the Delaware Valley and the Eastern United States' (1897); 'Tools of the Nation-Maker' (1897); etc.

Mercer, Hugh, American general: b. Aberdeen, Scotland, about 1720; d. near Princeton, N. J., 12 Jan. 1777. Educated as a physician, he served as surgeon's assistant in the army of the Young Pretender at the battle of Culloden. Emigrating in 1747 to America, he settled in Virginia, and resided there, in the practice of his profession, until 1755, when he volunteered in the expedition led by Braddock to Fort Duquesne. At the outbreak of the Revolution he promptly joined the Continental army, and obtained the rank of brigadier-general. He subsequently accompanied Washington on his retreat through New Jersey, and rendered valuable assistance at the battle of Trenton. In the succeeding action at Princeton he was mortally wounded and died a week later. Mercer County, N. J., was named in his honor.

Mercer University, Macon, Ga., is an institution having its genesis at a meeting of the Baptist Associations of Georgia, at Powelton, 27 June 1822, held to discuss, among other matters, the question of ministerial education. In 1827, at a similar meeting, held in Washington, Ga., the project was further discussed, and in 1829, Josiah Penfield, of Savannah, bequeathed \$2,500 as a fund for education, on condition that the Baptists should raise an equal amount. This was promptly done, and two years later it was resolved to establish "a Classical and Theological School . . . open only for those preparing for the ministry." It was soon seen, however, that the school could not be so restricted, and in 1832 this bar was removed. Mercer Institute was established on a site of 450 acres, at Penfield, in January 1833, with 39 students,— "Penfield" in memory of Josiah Penfield, and "Mercer," after Dr. Jesse Mercer, early conceiver and patron of the school. In 1837, a charter was obtained giving the in-

MERCERIZED COTTON—MERCIER

stitution collegiate rank, and changing its name to "Mercer University." Thereafter it grew steadily. The successive presidents were B. M. Sanders; Otis Smith; John L. Dagg; N. M. Crawford; H. H. Tucker; A. J. Battle; G. A. Nunnally; J. B. Gambrell; and P. D. Pollock, still in office. The Civil War threw its affairs into temporary confusion, and in 1871 the college was removed to Macon. Since then its resources and influence have been greatly increased, gifts have been frequent and generous, and its educational status has become recognized as sound and sure. Its alumni roll includes very many distinguished names. Mercer University at present comprises three colleges—Arts, Law, and Pharmacy. Its campus covers 20 acres; the buildings number 13, of which six are of brick and stone. The assets of the University amount to nearly half a million dollars. The present enrolment is 275, the number of instructors 25.

GEORGE HERBERT CLARKE,
Mercer University.

Mercerized Cotton, a process invented by John Mercer, of Lancashire, England, for treating cotton fibre or fabrics. The system was first patented in 1851. The process consists of steeping the cloth in a solution of caustic alkali. The tissue shrinks one fourth and takes more brilliant colors in dyeing than unmercerized cotton goods.

Mercersburg, mēr'sērz-bērg, Pa., borough, in Franklin County; at the terminus of a branch of the Cumberland Valley railroad; about 70 miles southwest of Harrisburg. It was settled in 1730 and was originally called Black Town. It was incorporated in 1831. The borough was enlarged in 1901. It is in a farming section of the county, but has some coal and iron interests. It was formerly noted for its educational institutions, which were under the auspices of the German Reformed Church in America. It is the seat of the Mercersburg Academy, which in 1902 had about 200 students and property valued at \$130,000. Mercersburg was the home of James Buchanan (q.v.). Pop. (1900) 956.

Mercersburg Theology, a school of religious philosophy founded by F. A. Rauch of the German Reformed Church in 1836, his work being taken up by John W. Nevin (q.v.) and Philip Schaff (q.v.). The name comes from the Mercersburg (Pa.) Theological Seminary of the German Reformed Church, whence the teaching of this system spread. The Mercersburg theology urged that the Church was not a voluntary society of believers but a historic and spiritual growth—an attitude showing markedly less hostility to the Roman Catholic Church; that old confessions can not express the modern faith of the church; that the sacraments are more than symbols; that church worship should be orderly—hence the 'Liturgy' (1858) and 'Order of Worship' (1866); and that religious education is of prime importance. The Mercersburg movement infused new life into the German Reformed Church. Consult Appel, 'Life of John Williamson Nevin' (1889).

Merchant Marine. See AMERICAN MERCHANT MARINE.

Merchant Marks. See MONOGRAM; TRADE-MARK.

Merchant of Venice, The, a comedy by Shakespeare (1594). It appears on the 'Stationers' Register' in 1598 and was issued in quarto in 1600, 1637, and 1652. The story of the bonds and that of the caskets are both found in the 'Gesta Romanorum,' but the poet used especially Giovanni Fiorentino's 'Il Pecorone' (Milan, 1558). Inadequate versions of the play by Dryden, Otway and others were seen on the stage till 1741 when Macklin produced the original play.

Mercia, mēr'shī-a, England, the largest kingdom of the Saxon heptarchy, now comprised in the midland counties on both sides of the Trent from the North Sea to Wales. Mercia was founded by Crida in 585. Like the other Anglo-Saxon kingdoms it had a stormy history, being almost continually at war with some of its neighbors. In 827 it was conquered by Egbert, who united the different kingdoms of England into one. As its frontiers extended to those of the other kingdoms, as well as to Wales, it derived its name from that circumstance (Anglo-Saxon *mearc*, march or boundary). See ENGLAND, *History*.

Mercié, Antonin, än-tō-nän mēr-sē-ä, French sculptor and painter: b. Toulouse 30 Oct. 1845. He studied under Jouffroy and Falguière; won the first Prix de Rome in 1868; and in 1872 obtained a medal of the first class for his bronze statue of the young David, now in the Luxembourg. His masterpiece was 'Gloria victis' (1874), followed by a nude throned Juno (1877), a marble statue of 'Painting' (1890); 'William Tell,' now in Lausanne; monuments to Thiers, Meissonnier (in front of the Louvre), and Jules Ferry, and 'Napoleon' on the Vendôme Column. He painted a Venus, now in the Luxembourg. Since 1891 Mercié has been professor in the Paris Academy.

Mercier, Honore', Canadian lawyer, journalist, and politician, some time premier of the province of Quebec: b. Iberville, Quebec, 15 Oct. 1840; d. Montreal, 30 Oct. 1894. He was educated at St. Mary's (Jesuit) College in Montreal and afterwards studied law at St. Hyacinthe, being admitted to the bar in 1865. During his legal studies (1862-64) he was editor of the 'Courrier de St. Hyacinthe,' the conservative organ of the district. As a journalist he was among those who opposed the project of Canadian Confederation, fearing that the union of the provinces might be fatal to the distinctive position of the French Canadians. This led him to abandon his editorship and to sever his connection with the Conservative party.

During the years immediately following the confederation of 1867 Mercier devoted himself to his profession, but in 1871 he reappeared in politics as the leader of the National Party (also called the Parti noir), whose leading aim was to curtail the power of the Dominion government in favor of provincial rights. On this platform he was elected to the federal parliament for Rouville in 1872, but did not stand for re-election to the parliament of 1873. After some four years devoted to the successful practice of the law at St. Hyacinthe, Mercier was elected (1879) to the Legislative Assembly of Quebec, being appointed solicitor-general of the province in the ministry of M.

Joly. On the defeat of the Joly administration in the same year, Mercier passed into the opposition, of which he presently became the leader.

In 1881 he left St. Hyacinthe to practise law in Montreal. In 1885 the French Canadian population was thrown into a ferment by the trial and execution of Louis Riel, the leader of the North West Rebellion (q.v.). Mercier, heading the agitation thus occasioned, declared Riel to have been a "victim of the fanaticism of Sir John A. Macdonald" (speech at Montreal 22 Nov. 1885). On the strength of the feeling this aroused, the Conservative party was defeated in the provincial elections of 1886 and Mercier found himself at the head of the administration. In this capacity he carried through the legislature the famous Jesuits Estates Act (q.v.), a measure intended to compensate the Jesuits for the property confiscated by the crown at the time of the papal dissolution of the order. In spite of the agitation throughout Canada against the act the Mercier government was upheld in the election of 1890. On a visit to Europe in connection with a provincial loan Mercier was created by the Pope a count and commander of the order of Saint Gregory (1891). In the same year grave charges of peculation were brought against the premier and his colleagues on the ground that a subsidy of \$100,000, intended for the Baie des Chaleurs railway, had been diverted to political uses. The investigation ordered by Lieutenant-Governor Angers resulted in the dismissal of the ministry (15 Dec. 1891). This action was ratified by the overwhelming defeat of the Mercier party in the election which ensued. The criminal charges brought against Mercier, as a result of this and a second official investigation, ended in a verdict of not guilty. Mercier remained a member of the assembly but with diminished influence and shattered health. He appears to have planned a movement in favor of Canadian independence, but his death prevented its realization.

STEPHEN LEACOCK,

Lecturer on Political Science McGill University.

Mercur, mër'kér, James, American soldier: b. Towanda, Pa., 25 Nov. 1842; d. West Point, N. Y., 22 April 1896. He was graduated from West Point in 1866 and commissioned in the engineering corps. He was engaged in surveys made under the government and in 1867-72 was assistant professor of natural and experimental philosophy at West Point, after which he was in command of an engineering corps and in 1876-81 assisted in clearing the New York harbor of the obstructions at Hell Gate. He was professor of civil and military engineering at West Point from 1884 until his death. He published a revised edition of Mahan's 'Permanent Fortification' (1887) and the original works, 'Elements of the Art of War' (1888); and 'Military Mines, Blasting, and Demolitions' (1892).

Mercur'ic Chloride. See CORROSIVE SUBLIMATE.

Mercuric Cyanide. See HYDROCYANIC ACID.

Mercury, mër'kü-ri, the Roman god Mercurius who presided over commerce and gain. See HERMES.

Mercury, the planet of the Solar System which is nearest to the sun. Owing to the position of its orbit, far inside of that of the earth, it is never seen by us at any great distance from the sun, but seems to swing back and forth, first on one side of the central luminary and then to the other. (See SOLAR SYSTEM). Its time of revolution is a little less than three months, and therefore less than one fourth that of the earth. When, starting from a point between the earth and the sun, it has completed a revolution, the earth has moved forward in its orbit, and, in consequence, nearly thirty days more are required to catch up with the earth and again come into conjunction with it. Consequently the time of one synodic or apparent revolution is nearly four months. It follows that its greatest elongations from the sun occur at intervals of nearly sixty days, alternately to the east and to the west. When near its greatest eastern elongations it may be seen in the west toward the close of twilight. When west of the sun it may be seen in the morning after daybreak. To the naked eye it seems to shine as a star of the first magnitude. But as it is never seen in a perfectly dark sky except when very near the horizon, it is not readily observable in high northern latitudes. It is said, in fact, that Copernicus died without ever seeing this planet.

With the aid of a telescope, Mercury may be seen the greater part of the time—in the afternoon when it is east of the sun; in the morning when it is west of it. But it is never seen fully illuminated unless near the farther part of its orbit, beyond the sun, when it may be lost in the effulgence of the sun's rays. When it approaches nearest to us, only a small portion of the hemisphere presented to us is illuminated. Owing to these unfavorable conditions observations on it are extremely difficult, and it cannot be said that anything is certainly known of its physical constitution. The difficulty is increased by its being much the smallest of all the major planets. The result is that nothing is positively known as to the time of the rotation on its axis. About 1800, Schroeter, a celebrated observer of the planets, thought it rotated in a little more than 24 hours. But Herschel found no foundation for this belief, and could see no evidence whatever of a rotation. About 1880 Schiaparelli, the celebrated Italian astronomer, making a very careful study of the planet, under the favoring sky of Milan, was led to the conclusion that, like the moon, Mercury's time of rotation was the same as its time of revolution in its orbit, so that it always presented the same face to the sun. A similar conclusion was reached by Lowell at the Flagstaff Observatory. But the difficulty of seeing any well-defined features on the planet is such that conservative astronomers are still in doubt on the subject, and regard the time of rotation as still unknown, and not likely soon to be determined.

The most remarkable feature presented by the motion of Mercury is that the perihelion of its orbit is found to move forward considerably faster than it ought to by virtue of the attraction of the known bodies of the solar system. The cause of this motion has perplexed astronomers for half a century, and no positive solution has been found. It was at first supposed by Leverrier to be due to the attraction

MERCURY

of one or more unknown planets between Mercury and the sun. But, as will presently be shown, this explanation is no longer tenable. Another explanation is that the motion is due to the sun's gravitation diminishing somewhat more rapidly than it would according to the law of the inverse square. If this is so, the perihelion of all the other planets ought to be effected by a similar motion. But it unfortunately happens that, up to the present time, it is not possible to discover with certainty whether there is or is not such an excess of motion in the case of the other planets. The reason of the difficulty is that the eccentricities of the orbits of Venus and of the Earth are so small that such a motion in their perihela cannot be detected until fifty or a hundred years more of observation have been made. In the case of Mars the observations seem to show that there is really such an excess of motion; but the result is not at all conclusive, and cannot be made so until a more perfect comparison than yet exists between the observations of Mars and the theory of gravitation has been made.

SIMON NEWCOMB.

Mercury, or Markery, a perennial herb (*Chenopodium bonus-henricus*) of the natural order *Chenopodiaceæ*. Like other members of its genus, it has mealy foliage, and inconspicuous greenish flowers. The tender shoots which appear in early spring are valued as a substitute for spinach, for which purpose the plant is frequently cultivated. In Europe it is better known as Good King Henry. It will grow in any garden soil with practically no attention.

Mercury, or Quicksilver, a metallic element which has been known for many centuries, and which is distinguished from the other metallic elements by the fact that it is liquid at ordinary temperatures. Mercury occurs native in the metallic form, but by far the larger part of it is obtained by distilling the native sulphid, cinnabar (HgS), in a current of air which is regulated so as to burn the sulphur of the sulphid, while leaving the mercury in the metallic state. Cinnabar occurs abundantly at Idria, Austria, at Almaden, Spain, and at New Almaden, near San Francisco Bay, and it is from these sources that the mercury of commerce is chiefly obtained. Mercury freezes at 37.9°F . below zero and boils, at the ordinary atmospheric pressure (760 mm.), at 675°F . Its specific gravity at 32°F ., when compared with water at 39°F ., is 13.596. Its specific heat at ordinary temperatures is about 0.0331, and its average coefficient of expansion between 32°F . and 212°F . is 0.00010085 (Fahrenheit scale). The ratio of the specific heat of the vapor at constant pressure to its specific heat at constant volume has been found, experimentally, to be 1.666, which indicates that the molecules of the vapor are monatomic, and that they behave, so far as their collisions among themselves are concerned, as though they were elastic spheres. (See GASES, KINETIC THEORY OF.) Mercury may be freed from dust and dirt by filtering it through leather. To remove tin, lead, and other dissolved metals, the mercury may be left for some weeks in contact with concentrated sulphuric acid, and subsequently digested with dilute nitric acid; or it may be several times dis-

tilled. Various other modes of purification are also known.

The metal is chiefly used, in the arts, for the extraction of gold from crushed ore or fine gravel, the ore being washed by a gentle stream of water over a copper plate which is amalgamated with mercury. The gold particles, being heavy, sink through the water so as to come into contact with the copper plate, where they are held by the mercury in the form of a gold amalgam. (See GOLD and AMALGAM.) In physics, mercury is also greatly used for filling thermometers and barometers, and for many other purposes. It is likewise used in medicine, both in the metallic form and in its compounds with other elements. Metallic mercury, when rubbed up in a mortar with confection of roses until its globules are so fine as to be indistinguishable to the eye, is known as "blue-mass," and is administered in the form of pills, as a cholagogue.

Mercury has the chemical symbol Hg (from "hydrargyrum," its Latin name), and an atomic weight of 200.3 if $\text{O} = 16$, or 198.8 if $\text{H} = 1$. It forms two oxids, each of which give rise to a series of stable salts. The metal does not oxidize upon exposure to air at ordinary temperatures, but when heated nearly to its boiling point in air or in oxygen, it slowly oxidizes, with the formation of mercury monoxid (or mercuric oxid), HgO . When prepared in this manner the monoxid is crystalline and red, and for this reason it is familiarly known as the "red oxid." The same substance may be prepared in an allotropic form by precipitating a solution of mercuric nitrate by the addition of caustic potash, the monoxid then coming down as an amorphous yellow powder. The red oxid turns black when strongly heated, but recovers its color upon cooling. When heated to redness the monoxid decomposes into metallic mercury and free oxygen. It can therefore be used as a source of oxygen; and it was in fact by heating this substance that oxygen was first discovered, by Priestley. By acting upon the red oxid or upon metallic mercury by excess of nitric acid, mercuric nitrate, $\text{Hg}(\text{NO}_3)_2$, is formed; while if nitric acid is allowed to act upon excess of mercury, mercurous nitrate, HgNO_3 , is obtained. The corresponding sulphates of the metal are obtained by acting upon metallic mercury with sulphuric acid, mercuric sulphate (HgSO_4) or mercurous sulphate (Hg_2SO_4) being obtained, according to the conditions of the experiment. Mercuric sulphid, HgS , which occurs native as the mineral cinnabar, and which is also known as vermilion, is bright red in color, and may be prepared artificially by heating mercury with sulphur, or by passing sulphuretted hydrogen gas through a solution of a mercuric salt. When obtained in the latter way it comes down as a black amorphous powder, which may be brought into the normal red crystalline form by sublimation. Mercury forms two chlorides which are extensively used, especially in medicine. Mercuric chloride (also known as "bichloride of mercury" or "corrosive sublimate"), HgCl_2 , is prepared by heating a mixture of equal parts of mercuric sulphate, HgSO_4 , and common salt, NaCl ; the reaction being $\text{HgSO}_4 + 2\text{NaCl} = \text{HgCl}_2 + \text{Na}_2\text{SO}_4$. The bichloride is fairly soluble in water, and dissolves readily in a solution

of sal ammoniac. It is also quite soluble in alcohol. It crystallizes in the trimetric system, melts at 509° F., and boils at 563° F. It is intensely poisonous, and is one of the most powerful germicides known. It is used in surgery and medicine as an antiseptic and disinfectant, and is occasionally administered internally in very small doses. Mercurous chloride, HgCl (more familiarly known as "calomel," or as the "mild chloride"), is a white powder, insoluble in water, and is greatly used in medicine, both as a cholagogue and otherwise. It may be prepared in various ways, but the usual method is by heating four parts of corrosive sublimate with three parts of metallic mercury; the mercury combining with half of the chlorine of the corrosive sublimate, as indicated by the equation $\text{HgCl}_2 + \text{Hg} = 2\text{HgCl}$. The calomel sublimes, and must then be ground to a fine powder and thoroughly washed, in order to remove any free soluble corrosive sublimate that may not have been decomposed. The so-called "white precipitate," which is obtained when ammonia is added to a solution of corrosive sublimate, has the composition NH_4HgCl . Mercurous oxid, or "black oxid of mercury," Hg_2O , may be obtained as a black powder by digesting calomel with excess of caustic potash. It decomposes into the red oxid and metallic mercury upon exposure to light, or upon being heated to the boiling point of water. Many other compounds of mercury are known, but they are of less importance than the ones here given.

Mercury, Fulminate of. See FULMINATES.

Mercury, Medical Uses of. Mercury uncombined is used only for its bulk. Triturated with some other substance it is valuable medicinally and produces specific mercurial effects, local and constitutional. Such compounds are blue mass (blue pill), mercury with chalk (gray powder), mercurial ointment, and mercurial plaster. All mercurial compounds entering the circulation have a peculiar influence over nutrition. This is especially true of the salts of mercury, such as mercurous chloride or calomel, mercuric chloride or corrosive sublimate, and mercurous iodide or the green iodide of mercury. In small doses, especially in syphilis, they are tonic, improving the quality of the blood; in large doses they impair it, and tend to inflame the mucous membrane of the mouth, stomach, and intestines. Calomel and blue pill are largely used for their laxative effects. Mercury in the various forms of powder, ointment, lotion, and plaster is used to remove body-vermin, relieve itching, and as a remedy in certain skin affections. See POISONS.

Mercury Vapor Lamp. See VAPOR LAMP, THE HEWITT MERCURY.

Mercy, Fathers of, Roman Catholic religious congregation founded on the restoration of Louis XVIII., 1814, and approved of by the Pope (1834) under the title 'Society of the Priests of Mercy.' The object of the society is the conversion of sinners by mission preaching, and the practice of the corporal works of mercy. In 1839 the order founded houses in New York and Saint Augustine, Fla., and the fathers have churches for the French population in Brooklyn and Manhattan. The mother house was originally at Paris, but was removed to Rome in 1903 as a result of the Association Law. Con-

sult Delaporte, 'Vie de Jean-Baptiste Rauzan' (1857).

Mercy-seat (Heb. *Kapporeth*, covering or lid, that is, of the sacred ark in the ancient Jewish tabernacle), an unfortunate and inappropriate term as applied to the cover of the chest or ark containing the two tables of the law, and overspread by the wings of the Cherubim. Between these wings appeared the Shekinah or fiery symbol of the divine presence hovering over the mercy-seat, which consisted most probably of a sheet of the finest gold (Ex. xxv. 17, etc.; xxx. 6; xxxi. 7, etc.). The New Testament writers seem to hold that the term contains by implication the idea of the propitiation (q.v.) (Heb. ix. 5; Rom. iii. 24). The high priest sprinkled on it the blood of the yearly atonement, and some writers think that the term covering as applied to it refers more to the covering of or atonement for sins than to its use in covering the treasures of the ark. In any case the idea of a seat, as if the expression in Psalms xcix. 1, "he sitteth between the cherubims" referred to the earthly tabernacle, is inappropriate. Consult: Pratenias, 'De Judæa Arca' (1727); Werner, 'De Propitiatoria' (1695). See SHEKINAH.

Mercy, Sisters of, a name given to members of several religious communities founded for the purpose of nursing the sick at their own homes, visiting prisoners, attending lying-in-hospitals, superintending the education of females, and the performance of similar works of charity and mercy. Communities of Sisters of Mercy are now widely distributed over Europe and America. There are also religious under the same name connected with the Anglican Church. The term is applied more specifically to the Order of Our Lady of Mercy, a Roman Catholic order founded for the objects above enumerated in Dublin 1827. The first house in America was established in Pittsburg, Pa., 1843, and from it have sprung 65 convents. Consult 'Leaves from the Annals of the Sisters of Mercy' (1881). See McAULEY, CATHERINE.

Mer de Glace, *mâr dê glâs*, France, an Alpine glacier on the northern slope of Mont Blanc, with an area of 16 square miles, and an extreme length of about nine miles. It is formed by the confluence of three branches called the Glacier du Géant, the Glacier du Lechaud, and the Glacier du Talèfre and is noted for its beautiful scenery. It ends as the Glacier des Bois whence flows the Arveyron River, in the valley of Chamouni. From the village of Chamouni the Mer de Glace is easiest visited and Mont Blanc ascended. The glacier has an average flow of two feet a day during summer and autumn.

Meredith, George, English poet and novelist: born, Hampshire 12 Feb. 1828. Published details of Meredith's life are rather meagre; little is known of his parentage or of his education except that he was sent to school in Germany and later studied law, which he gave up for literature. For a time he was a pupil of T. L. Peacock (q. v.), whose daughter he married as his first wife. His residence has for some years been at Box Hill in Surrey.

His first work in literature was a volume of poems published in 1851. This was followed, in 1856, by 'The Shaving of Shagpat,' a brilliant, fantastic Oriental tale in which some inter-

preters have professed to see a political satire. In 'The Ordeal of Richard Feverel' (1859), however, he began the course of studies in human temperament which have made his name famous. The novel, unquestionably one of the most powerful in the language, deals with the ordeal of adjustment to the world of a high-spirited youth; it is the conflict between temperament and desire, represented in the hero, and a variety of conventions, most rigidly typified in the "system" of his father, Sir Austin Feverel. The effect of the book is chiefly tragic. 'Evan Harrington' (1861), the next novel, is wholly comic in idea; the characters are embodiments of various "humors," most strikingly represented in the intriguing Countess; the plot, as in all of Meredith's novels, is quite secondary in interest, and springs from the characters. 'Modern Love,' a sequence of brilliantly phrased, intricate, 16-lined sonnets, was published in 1861. 'Emilia in England,' now called 'Sandra Beloni,' appeared in 1864, and its sequel 'Vittoria' three years later. The story is that of a young Italian girl of unaffected manners and character, and her life among people of very diverse temperaments and social ideas; the theme of the novel may be regarded as the conflict, among very real people, of the genuine with the sentimental character. Between the two novels appeared, in 1865, 'Rhoda Fleming,' perhaps the simplest of all Meredith's novels in style, and a powerful study in character. It deals, on the whole, with a conventionally more humble order of society than that usually found in Meredith's novels, and is rather more direct, but few things in fiction are more impressive than the almost instinctive steadfastness of the heroine or more gloomy than the spiritual confusion that she tries to set in order. In 'The Adventures of Harry Richmond' the note is again chiefly comic. Much of Meredith's best work lies in the freshness of the varied scenes of this book, and in the hero's father is perhaps as typical a character of the novelist as can be found, a man whose adventurous fancy and devotion to his son "informs" numberless odd and extravagant acts. Another excellent study of a different sort is 'Beauchamp's Career' (1876). It is the analytical, yet lively, story of a young man whose earnestness of character and whose activity caused him, from a conventional point of view, to fail in life. Like other of Meredith's novels it is a great contribution to our understanding of the varieties of human temperament and to our sympathy with them.

In 'Beauchamp's Career' perhaps more than in any of his preceding novels Meredith directly explained his aim in drawing character; it was to present a type of motive, and to show how it dominates and gives unity to a series of acts. The motive which causes action is, so to speak, temperamental rather than deliberate; in typical examples like the Countess in 'Evan Harrington,' or Beauchamp, for instance, Meredith is interested in the expression of temperament rather than a story. The Countess, on the face of the matter, wished for the social advancement of her family; what she really wanted was scheming for the sake of scheming, and her social ambitions were but the medium of expression. This manner of approaching character, indeed, dominated all the character drawing in Meredith's novels, but it was not expressed

as a deliberate theory until the publication, in 1877, of 'On the Idea of Comedy and the Uses of the Comic Spirit.' The essence of this essay is that comedy is one of the most wholesome and effectual ways of probing and purifying the ill of the world, that good comedy, as in the plays of Molière, really enables the reader to recognize what is genuine and discard what is sentimental; unfortunately, instead of good comedy we often are treated, in most literature, to painful moralizings. Meredith's fullest and finest expression of this idea is in his 'The Egoist' (1879), unquestionably his masterpiece and one of the chief glories of English fiction. Egoism, that love of self which prevents men from seeing things in their true relations, is one of the fundamental failings of mankind, and Meredith has drawn it, in the inimitable Sir Willoughby Patterne, as a figure of colossal proportions. The novelist's skill and dispassionate-ness as an artist was never better shown than in the fact that he refuses to give conventional rewards and punishments; for the hero's unflinching egoism permits him in the end to turn to the flattering of his vanity what would ordinarily be regarded as humiliation.

Pursuing his end, an analysis and a synthesis of the springs which govern action, Meredith in his next novel, 'The Tragic Comedians' (1880) took a story from contemporary European court life and explained it as a piece of dramatic psychology. The comparative shortness of the novel makes it a good study of the author's method. This novel, too, indicated a tendency on his part to depict the motives and the psychology of people actually in existence rather than, as in 'The Egoist' and its predecessors, to draw the embodiment of a type of "humor." This tendency was certainly evident in his next novel, 'Diana of the Crossways' (1885), his greatest popular success, and is shown in the fact that certain of the incidents and characters excited curiosity as to their originals. It is manifest also in his last three books, 'One of Our Conquerors' (1890), 'Lord Ormont and His Aminta' (1894), and 'The Amazing Marriage' (1895), which are perhaps less broadly representative and more particular than his earlier novels. Meredith's writings also include four short stories, 'The Tale of Chloe,' 'The House on the Beach,' 'Farina,' and 'The Case of General Ople and Lady Camper.'

Meredith, who shares with Thomas Hardy (q. v.), the distinction of being the foremost of living (1906) English novelists, belongs to the so-called psychological school, of which the great popular representative is George Eliot, with whom he is practically contemporary. He differs from her in several important respects: The comedy of character (as the term is understood with Cervantes and Molière) as well as the tragic side of life, is reflected in his pages. His attitude is detached and impersonal, and he never allows his sympathies to intrude upon his study of the type he is treating, a characteristic which accounts for the criticism sometimes made that he lacks temperament, and which is doubtless one of the reasons for his comparative unpopularity. He is more interested in his characters as types of temperament than as individuals, and in this field he has perhaps represented the greatest range and variety of human motive that is to be found in English fiction. Taking

strata of society, on the whole, conventionally above those treated by George Eliot, he has made them representative of a great variety of "comic" motives. As a moralist, his attack has been upon those types which are broadly termed sentimental, and in this respect his pictures of such men as Wilfred Pole and Willoughby Paternie are inimitable. The person that he most approves is the simple, considerate, intelligent being, well represented in such minor heroes as Merthyr Powys, Vernon Whitford, Dartrey Fennellan, and Tom Redworth, and pictured to the height of brilliancy in his real heroines. In no other novelist, in no English writer except Shakespeare, can be found so splendid a galaxy of women: Rose Jocelyn, Janet Ilchester, Renée, Cecilia Halkett, Jenny Denham, Clara Middleton, Emilia, Carinthia Jane, and many others, as well as such older ladies as Lady Jocelyn and Lady Charlotte Eglett, are the best tribute to womankind that English literature possesses, and the creation of them is an achievement of the very first rank. His style is frequently criticized as involved and epigrammatic, but no novelist contains passages of greater poetical charm.

Bibliography. The best complete American edition of the poems and novels is by Messrs. Scribner, in 16 volumes. Commentary is scattering and appears chiefly in the form of contemporary reviews. Consult Brownell, 'Victorian Prose Masters' (1901), Hannah Lynch, 'George Meredith' (1891), and, for a varied symposium, LeGallienne, 'George Meredith, Some Characteristics'; with a Bibliography by John Lane, and for his place in the history of the novel, Cross, 'The Development of the English Novel' (1899).

W. T. BREWSTER,

Professor of English in Columbia University.

Meredith, Louisa Anne Twamly, Australian author and artist: b. Birmingham, England, 20 July 1812; d. Hobart Town, Tasmania, 21 Oct. 1895. She had already published a volume of verse (1835); and 'The Romance of Nature,' illustrated by herself (1836), before she married her cousin Charles Meredith (1839) and removed to Australia, whence they went to Tasmania five years later. She continued her literary activity till the end of her long life, and for many years before her death had been the most prominent Tasmanian author. Among her many books, often illustrated by herself are: 'My Home in Tasmania' (1852); 'Over the Straits' (1860); 'Tasmania: Friends and Foes, Feathered and Furred' (1880). Her prose works were popular in Australia and had also a circulation in England and this country; and her verse, of which she published several collections, was at once pleasing and unpretentious.

Meredith, Owen. The pseudonym of Bulwer-Lytton. See LYTON, EDWARD ROBERT BULWER.

Meredith, Sir William Ralph, Canadian jurist: b. Westminster, Ont., 31 March 1840. He was educated in the University of Toronto and was admitted to the bar in 1861 when he established a law practice in London, Ont. He was a member of the Ontario legislature 1872-94 and became queen's counsel in 1876. In 1894 he was appointed chief justice of the Court of

Common Pleas which office he still holds, and he is chancellor of the University of Toronto. He was knighted in 1896.

Merganser, or **Fish-duck**, a duck of the genus *Mergus*, distinguished by the slender cylindrical bill, the upper mandible terminating in a strong hooked "nail," and the margins presenting the appearance of rows of tooth-like processes. The most widely distributed is the red-breasted (*Mergus serrator*), known as sheldrake in America where it is less numerous than in the Old World. The goosander (*Mergus merganser*) and the nun or smew (*M. albellus*) are familiar European and Asiatic species, while the hooded merganser (*Lophodytes cucullatus*) or sawbill is familiar in North America. The mergansers feed chiefly upon fishes, and swim and dive after their prey with great ease and dexterity. They are essentially northern in their distribution, breed in the far north, and migrate southward on the approach of the colder season. The nest is built of grass and roots, and is lined with down. It is usually placed in a hollow of the bank near water; but some species prefer the greater security of a hollow tree. The flesh is coarse and rank. Eight or ten species are known in various parts of the world. The female alone incubates, but the male watches near the nest. From eight to fourteen eggs are laid, and the young enter the water as soon as they are hatched.

Mergenthaler, mĕr'gan-tă-lĕr, **Ottmar**, American inventor: b. Würtemberg, Germany, 10 May 1854; d. Baltimore 28 October 1899. He was a watchmaker by trade; came to the United States at 18, entered the employ of the United States government at Washington, where he kept clocks and electrical bells throughout government buildings in order; improved apparatus used in the signal service; and in 1876 removed to Baltimore, where he devoted himself to perfecting a type-setting machine. On this he spent several years, his scheme going through four stages, the last of which was the linotype (q.v.). When he had patented this machine he had much difficulty in introducing it. It was perfected by the addition of the Rogers spacer, brought its inventor large profits, and is now in very common use in large printing establishments. Mergenthaler also invented a basket-making machine.

Merger, (1) in law, the sinking or obliteration in conveyancing of lesser estates or property, into greater ones; or the consolidation of two or more estates; (2) a term used in financial or business circles, meaning the consolidation or combination of a particular class of manufactories, railroads or other business interests; generally in the nature of a trust.

Mergui, (mĕr-gĕ') **Archiipelago**, a chain of islands in the Bay of Bengal, off the coast of Tenasserim in Burma, the more northern ones forming a part of the British district of Mergui; area, 10,000 square miles. They are generally covered with trees, and present many picturesque features, rising at some points to the height of 3,000 feet. The inhabitants belong to a race called Selungo. They give little attention to agriculture, obtaining a sustenance mainly by fishing, pearl gathering, and selling edible birds' nests. The Selungs are peaceful and industrious, but few in number. The adjoining seas

abound in fish and excellent oysters; pearls of good quality are found. Pop. (1901) 88,667.

Merida, Mexico, the capital city of Yucatan. The city was founded in 1542, and is situated on a level plain but little above sea level. There are railway connections with all important points in the interior, and several lines of steamers ply between Progreso, 25 miles distant, and Veracruz, New York, and other prominent commercial ports. The surrounding country is almost entirely devoted to the henequen industry, which has reached enormous proportions in the state. There are manufactories of cotton goods, cigars, panama hats, leather, soap, etc., and considerable trade in sisal hemp. The principal buildings are the government palace, the municipal palace, the Casa del Conquistador Montejo (the first Spanish house built in the city), the old Cathedral, the School of Arts, the Penitentiary, Literary Institute or State College, Normal School for Teachers, Meteorological and Astronomical Observatory, Yucatan Museum, Catholic College of San Ildefonso, schools of medicine, surgery, pharmacy, jurisprudence, and notarial instruction; the Literary Institute for Girls, the College for Girls, the Catholic School for Girls, the Teresano College, the Primary School of Arts and Works, and the Institucion de Beneficencia Privado, founded by Leandro L. Ayala at an outlay of \$1,000,000. There are an Asylum for Maniacs, a Lazareto, a Maternity Hospital, three other hospitals, an Asylum for Mendigos, two theatres, and an arena for bull fights. The Hidalgo Park contains a statue of General Cepeda Peraza; and one symbolizing the peace of the state. Near the great Cathedral are also large statues of Saint Peter and Saint Paul. A Body of Public Security, a Jefe Politico and an Inspector General preserve order and insure safety to all. The streets are paved with asphalt. Merida contains two local financial institutions—the Banco Yucateca, with a capital of \$8,000,000, and the Banco Mercantil de Yucatan, with a capital of \$6,000,000, and a branch of the National Bank and an agency of the Bank of London and Mexico. Pop. (1906) about 42,000.

Merida, Venezuela, town, capital of the state of Los Andes; 5,290 feet above sea-level, at the foot of the Sierra Nevada de Merida, and 70 miles south of Lake Maracaibo. It was founded in 1558 by Juan Rodriguez Saurez. It was almost wholly destroyed by an earthquake in 1812. It is the seat of a bishop, contains one of the two National universities of Venezuela, and has several high schools. Its manufactures are carpets, woolen and cotton goods. Pop. about 11,862.

Meriden, Conn., city, in New Haven County; on branches of the New York, New Haven & Hartford railroad; about midway between Hartford and New Haven. Originally the town of Meriden was a part of Wallingford until 1806, when the town of Meriden was incorporated. In 1867 it was granted a city charter. It is situated in an agricultural region, but the city is noted for its large number of manufactories. Some of the principal manufactures are cutlery, silver and plated ware, steel pens, hardware, machinery, screws, vises, glass-ware, cut glass, malleable iron, bronzes, fire-arms, brass castings, curtain fixtures, gas and

kerosene fixtures, self-playing attachments for pianos and organs, woodenware, tinware, granite, agate-ware, lamp trimmings, etc. The shipments are principally manufactured articles, fruit, vegetables, and tobacco.

The educational institutions are the public and parish schools, a high school and the Curtis Memorial Library. It has the Curtis Home for Orphan Children and Aged Women, the Connecticut School for Boys, and the Meriden Hospital. The government is administered under a charter of 1897. The mayor, who holds office two years, appoints fire and park commissioners, board of taxation and apportionment, police and board of public works. The council elects the health officer, board of compensation, tax collector, plumbing inspector, boiler inspector and fire marshal. The treasurer, sheriff, clerk, and auditor are chosen by popular vote. Pop. (1900) 24,296.

Meridian, Miss., city, county-seat of Lauderdale County; on the Mobile & Ohio, the New Orleans & Northwestern, and the Southern R.R.'s; about 90 miles east of Jackson. The city is surrounded by fine farm land on which a large quantity of cotton is raised. The chief industrial establishments are cottonseed-oil mills, cotton mills, lumber mills, railroad shops, cotton-gins and cotton compresses. It is the seat of the East Mississippi Female College (M. E.), founded in 1867 and opened in 1869, the Lincoln School (Congregational) and the Meridian Academy (Methodist Episcopal South) both for colored students. Pop. (1900) 14,050.

Meridian (Miss.), **Expedition to**. In January 1864 Gen. Sherman concentrated two divisions of 10,000 each at Vicksburg under Gens. McPherson and Hurlbut, and 3 February marched eastward with the purpose of destroying Meridian, 150 miles distant, as a railroad centre, and possibly penetrating to Selma, Ala., or, if the opposing forces did not seem too strong at Mobile, to turn southward from Meridian and attempt the capture of that city. Gen. Sooy Smith was to co-operate with a cavalry force from Memphis; Gen. Dodge, in command at Pulaski, Tenn., was to hold Logan at Bellefonte, Ala., for a diversion toward Rome, Ga.; and Gen. Thomas was to demonstrate toward Dalton to prevent troops being sent by Gen. Johnston to Sherman's front. Sherman entered Jackson on the 6th, after heavy skirmishing with cavalry. Decatur was reached on the 12th. Meridian was taken the 14th, the Confederate force, under Gen. Leonidas Polk, being much less than Sherman's, withdrawing toward Demopolis. The arsenal, extensive storehouses, and cantonments were burned. The work of destroying the railroads centring at Meridian began on the 16th, 60 miles being rendered utterly useless to the north and east, and 55 miles toward Mobile. This destruction was of the most systematic and thorough character; 10,000 men worked at it for five days; 61 bridges and culverts, and more than a mile of trestles over swamps were burned; all rails were rendered useless. This object of the expedition was fully gained, as Meridian was not wholly restored as a railroad centre during the war. Thereafter, the transporting of supplies eastward from the State of Mississippi was seriously interrupted for a long time, and was greatly impeded up to the close of the war, while

all military operations which required railroad facilities were rendered extremely difficult.

The expedition, however, was not as successful as had been hoped. The Confederates, by the exercise of great energy in the face of many difficulties, so strengthened Mobile as to forbid an advance in that direction. Sherman, not receiving the cavalry support under Gen. Sooy Smith which he had reason to expect from Memphis, was unable to push on to Selma, Ala., one of the great manufacturing cities and storehouses for military supplies of the Confederacy. Smith, in turn, had been unavoidably detained, and Sherman returned to Vicksburg, reaching its vicinity 26 February. His command had marched between 300 and 400 miles, had crossed Mississippi, and inflicted well-nigh irreparable military damage; but had been prevented from carrying out his full programme by Confederate activity in assembling forces in his extreme front.

H. V. BOYNTON.

Meridian, one of the innumerable imaginary lines on the surface of the earth that may be conceived of as passing through both poles and through any other given place, and serving to settle the longitude of places, and thus to mark their exact position. There are also corresponding lines called astronomical or celestial meridians, which are imaginary circles of the celestial sphere passing through the poles of the heavens and the zenith of any place on the earth's surface. These correspond exactly to the geographical meridians, that is, the celestial is exactly above the geographical meridian of any place. Every place on the globe has its meridian, and when the sun arrives at this line it is noon or midday, whence the name (Latin, *meridianus* — *medius*, middle, and *dies*, day). (See LONGITUDE.) The inconvenience arising from having a fixed meridian in different countries is sufficiently obvious, and geographers, navigators, and astronomers have all found it frequently a source of confusion. After years of fruitless discussion the question of a reference or first meridian for the world came before an international conference held at Washington, 1 to 22 Oct. 1884. There, although the representatives of France and Brazil dissented, it was agreed to recommend the meridian of Greenwich both as the astronomical and as the geographical reference meridian of the world, longitude to be reckoned east and west from this up to 180°. At the same time it was advised that the astronomical day should begin at midnight, mean Greenwich time, the hours for astronomical purposes being reckoned as before from 0 to 24. This arrangement began on 1 Jan. 1885. Previously many foreign map-makers had accepted the meridian of Greenwich as first meridian, Germans and Americans apparently having no jealousy of Great Britain in regard to the matter. The change of time has had some importance for astronomers, but ordinary civil time is still computed much as before. The zone system of reckoning standard time was adopted in the United States in 1883 and in Australia in 1895. In the former country there are four zones: the Eastern, taking time from the meridian of 75° W. (5 hrs. slow on Greenwich time); the Central, with standard meridian 90° W. (6 hrs. slow); the Mountain, 105° W. (7 hrs. slow); and the Pacific, 120° W. (8 hrs. slow). There are three Australian zones: Queensland, New South Wales, Victoria, and Tasmania, with 150°

E. (10 hrs. fast) as standard; South Australia, with 135° E. (9 hrs. fast); and Western Australia, with 120° E. (8 hrs. fast). Other standards adopted with reference to Greenwich are: 15° E. (1 hr. fast) for Mid-Europe; 22½° E. (1½ hrs. fast) for Cape Colony; 30° E. (2 hrs. fast) for Natal; 135° E. (9 hrs. fast) for Japan; and 172½° E. (11½ hrs. fast) for New Zealand.

Meridian Circle, in astronomy, an instrument used in observatories to combine the functions of a transit instrument and of the old mural circle. A vertical circle is carried on the axis of the transit instrument and revolves with it, its divisions being read by micrometer microscopes mounted solidly on one of the piers. In this way both co-ordinates of the position of a heavenly body, its right ascension and declination, are determined at the same meridian passage—a great saving of time over the old method with the instruments.

Meridian Conference, an international convention, held in October 1884, at Washington, D. C., for the purpose of adopting a common prime meridian from which to reckon longitudes, and for other kindred purposes. See MERIDIAN.

Mérimée, mǎ-rê-mǎ, **Prosper**, French author: b. Paris 28 Sept. 1803; d. Cannes 23 Sept. 1870. He was educated at the Collège Henri IV. and studied law though he never practised it. Under the pseudonym 'Joseph LeStrange' he published in 1825 'Theatre de Clara Gouz, Comedienne Espagnole,' an assumed translation from the Spanish of eight prose comedies, but in reality his own work. From that time onward he continued to publish works at frequent intervals and at the same time had an official career of importance. Following the revolution of July 1830, he was made secretary to the ministers of commerce and marine, in 1831 was appointed inspector of ancient monuments, in 1844 became a member of the Academy, and senator of France in 1853. He was a commander of the Legion of Honor in 1860. Beside publishing several important works connected with his duties as inspector of ancient monuments he was the author of 'Colomba' (1840), a very popular novel of the Corsican vendetta; 'Carmen' (1847), a romance upon which the famous opera 'Carmen' by Bizet is founded; 'Lettres à une Inconnue,' his most famous work (1873); 'Lettres à une autre Inconnue' (1875); 'Lettres à Panizzi' (1881); 'Une Correspondance Inédite' (1896). The four works last named are Mérimée's most characteristic writings revealing him as a most loyal devoted friend. They differ widely from his other works, which though often brilliant are hard and unsympathetic, while these are tender and romantic. As a master of style Mérimée had few equals in his day. Consult: Filon, 'Mérimée et ses Amis' (1894); Haussonville, 'Mérimée' (1888); Tournoux, 'Prosper Mérimée, ses Portraits, ses Dessins, etc.' (1879).

Mer'ington, **Marguerite**, American playwright: b. England about 1860. Among her dramas are 'Daphne,' 'Captain Letterblair'; 'Love Finds the Way.'

Meri'no, a woolen or worsted fabric, introduced about 1826, and so named because made from the wool of merino sheep. See WOOL.

MERINO SHEEP—MERMAID

Merino Sheep. See **SHEEP.**

Merit, Order of, a British order instituted by King Edward VII., 26 June 1902, to confer distinction on persons in military, scientific, artistic and professional circles. The order follows the Order of the Bath. Twelve persons were decorated with the new order during 1902-3.

Merit System, The. See **CIVIL SERVICE REFORM.**

Merivale, mēr'i-vāl, Charles, English historian and ecclesiastic: b. Barton Place, Devonshire, 8 March 1808; d. Ely 27 Dec. 1893. He was educated at Cambridge, took orders in the English Church, was rector of Lawford, Essex, 1848-69, and dean of Ely from 1869. He published 'The Fall of the Roman Republic' (1853), which forms the first part of his popular 'History of the Romans under the Empire' (latest ed. 1890); 'General History of Rome' (1875); 'Lectures on Early Church History' (1879); etc. Consult, 'Autobiography and Letters' edited by his daughter (1899).

Merivale, Herman, English statesman and political economist; brother of Charles; b. Dawlish, Devonshire, 8 Nov. 1806; d. London 9 Feb. 1874. He was educated at Oxford, where he was professor of political economy 1837-42. He was under-secretary for the colonies, 1848-59 becoming perpetual under-secretary for India in 1859. He wrote 'Colonization and Colonies' (1841); a much valued work; 'Historical Studies' (1865); 'Memoirs of Sir Philip Francis' (1867).

Merivale, Herman Charles, English author: b. London 1839; d. 15 Jan. 1906. He was educated at Harrow and Oxford, became a barrister of the Inner Temple in 1864 and edited the 'Annual Register' 1870-80. Among his publications are: 'The White Pilgrim and Other Poems' (1875); 'The Cynic' (1882); several plays; 'The Whip Hand' (1884); 'The Dove' (1888). He was a son of J. H. Merivale.

Meriwether, Lee, American lawyer, social reformer, and author: b. Columbus, Miss., 25 Dec. 1862. Having obtained a secondary education at Memphis, Tenn., he there published the 'Free Trader' with a brother, Avery, in 1881-3, and in 1885-6 toured Europe afoot from Gibraltar to the Bosphorus for study of the condition of Continental workmen and of the protective tariff. He was appointed by the secretary of the interior to write for the United States Labor Bureau a report on the 'Condition of European Labor,' published in the annual report of the bureau for 1886. In 1886-9 he was employed as a special agent of the department of the interior for which he made investigations of labor in the United States and the Hawaiian Islands, and in 1891 visited the island prisons of the Mediterranean. He was admitted to the bar in 1892, and in 1893 entered practice at St. Louis. In 1889-90 and 1895-6 he was labor commissioner of Missouri. His reports on municipal government and street-railway franchises led to his nomination in 1897 for the mayoralty of St. Louis on the Democratic ticket. He was defeated at that time and also in 1901, when he was candidate of the Public Ownership party. Besides his various reports, he has published 'A Tramp Trip: How to see Europe on Fifty Cents a Day' (1887); 'The Tramp at

Home' (1890); 'Afloat and Ashore on the Mediterranean' (1892), and other works.

Merle d'Aubigné, Jean Henri. See **D'AUBIGNÉ, JEAN HENRI MERLE.**

Merlin, mēr'lin, a semi-legendary British prophet and magician, supposed to have flourished toward the end of the 5th century. The accounts of him are hopelessly mixed with fiction. He was said to be the son of a demon and the daughter of a British prince, and was brought up at Caer-Merlin, a city supposed to be the modern Carmarthen. He received from his father the power of working miracles and was the greatest sage of his time, the counsellor and friend of English kings. Vortigern, according to the legend, on the advice of his magicians, had resolved to build an impregnable tower for security against the Saxons; but the foundation was scarcely laid when the earth opened by night and swallowed it up. The magicians informed the king that to give firmness to the foundation he must wet it with the blood of a child born without a father. After much search the young Merlin was brought to the king. Merlin disputed with the magicians and showed them that under the foundation of the tower was a great lake, and under the lake two great raging dragons, one red, representing the British, one white, representing the Saxons. The earth was dug open, and the dragons began a furious battle; whereupon Merlin wept, and uttered prophecies respecting the future state of England. Merlin is a character in Tennyson's 'Idylls of the King.' A collection of the prophecies attributed to him appeared at Paris in 1498, at London in 1529 and 1533, at Venice, 1554. They can be traced back to about 1360. His prophecies were published at Edinburgh in 1615 and contain also those ascribed to the Cambrian or Welsh Merlin.

Merlin, or Stone-falcon, a small and handsome European falcon (*Æsalon regulus*) pre- vailingly blue, known throughout the temperate parts of the old world, and very similar to the American pigeon-hawk (q.v.). It is fierce and courageous, and is trained in falconry for the pursuit of the birds that form its natural prey.

Mermaid, a mythical being living within and under the sea, having the form of a woman above the waist and that of a fish below it. They are usually described as having great personal charms, and as using these for the purpose of luring imaginative and amorous men to destruction by enticing them into the depths of the sea; and, as a correlative, they are sometimes represented as securing their own destruction by quitting the sea, through marriage with some favored human husband by which they magically obtain temporarily a complete human form and soul, but always end in bringing disaster to one or both of the sacrilegious pair. Mermen are also occasionally heard of, but take an unimportant part in the legendary lore of the sea.

This mediæval notion is doubtless a survival of the primitive fancies, half fearful, half poetic, which created the classic conceptions of tritons, nereids, and the like. Shakespeare wrote (*Ant. and Cleop.*, II., 2, 211):

Her gentlewomen, like the Nereides,
So many mermaids, tended her.

All of these ideas probably arose from a mixture of observed human resemblances in certain marine animals with purely mystical fancies

which peopled the ocean with similitudes to terrestrial creatures. Primitive men have everywhere derived a large part of their sustenance from the natural products of the waters; and always the vastness and mystery of the sea, full of strange creatures and incomprehensible phenomena, have powerfully affected the imagination of the ignorant and superstitious. To this day the ocean is more familiar and more important in the life of many isolated peoples, who dwell upon its margin and derive their support almost exclusively from it, than is the land; and they invest it and everything it contains with a wondering regard which the inlander can neither share nor understand. To these, even in civilized regions (as on the coast of Ireland or the Hebrides) mermaids remain only one of many present realities, herding sea-cattle and lying in wait for unwary humanity as surely as when sea-horses raced over the Ægean waves with the car of Poseidon or the Sirens tempted the mariners of ancient Greece. In one form or another such stories have been rife in the folk-lore of all maritime peoples since prehistoric times; and, although not so widespread, the belief in mermaids, and their kith and kin, is still a matter of firm faith with hosts of persons in all parts of the world. Folk-lore abounds in evidence of this.

The physical basis for these notions rests upon the resemblance which some marine animals bear to human beings when seen at a distance and in certain attitudes. Such, in northern countries, are various seals, which formerly abounded upon the coasts of western Europe, and still are to be seen in the less frequented spots. They have a way of lifting their round heads and shoulders from the water, with a queer human intelligent look upon their faces, and hugging their young to their bosoms with motherly affection. Impressed with this resemblance, easily turned into a story to beguile a long winter evening or to amuse a child, and growing with imaginative repetitions, the northern peoples were quick to believe the similar and more elaborate stories brought to them by early voyagers from the Mediterranean, and so the tales grew and changed into the rich folk-lore of the coasts of the North Sea.

The southern stories, embellished by classic culture into the sea-myths of Neptune, Proteus and the sea-nymphs of old, and descending into the mermaids and mermen of mediæval folk-lore, yet alive around the Mediterranean and Oriental seas, and among sailors generally, probably have their root in the aspect of the East Indian and African dugongs (q.v.). Near at hand these uncouth monsters would never be mistaken for human beings; but seen at a distance, by fearful and wondering voyagers along the coast, such an error might easily happen, for they frequently stand upright among the weedy shallows of the coasts, perhaps draped with loosened vegetation like long hair, and holding to their breasts a young one who nurses from pectoral mammæ much as a human baby would do. Such reports, brought back to the enquiring poetic minds of Greece, might easily blossom into the tales of sea-mythology which formed so large and real a part of the popular belief as well as of the legendary lore of the classic age of India, Persia and the Mediterranean peoples. The fish-gods of the Phœnicians and other idolaters are closely related.

From this has come down to us the extensive and varied use of mermaids and mermen in heraldry. "In French heraldry," says Robinson, "the mermaid is called the Siren; in German she has two tails; in the Italian she carries a harp; and in many cases in each country she is crowned. In England it is a very ancient crest, and among others the lords Byron, the earls of Portsmouth . . . and many others display the sea-maiden in their armorial bearing. With her comb and looking-glass she smiles at us from the shields of the Holmes, Ellises, Lapps; and as a supporter holds up the arms of the Viscounts Boyne and Hood, the earls of Howth and Caledon, and is borne by the heads of the families of Sinclair of Rosslyn, and Scott of Harden. Two mermaids crowned are the supporters of the Boston arms."

Artificial mermaids, claiming to be preserved realities, have formed a part of the stock of curiosities of wonder-shows since time immemorial; and most of those exhibited since the days of Barnum have been the products of Japanese ingenuity.

ERNEST INGERSOLL.

Mermaid's Head, a globose sea-urchin, as one of the heart-urchins.

Mermaid's Purse, the egg-case of the skate (or shark), which is often cast up empty on the shore.

Merman. See MERMAID.

Mero, or **Merou**, a West Indian name for a jewfish (q.v.).

Merobandes, Flavius, a Spanish rhetorician and poet of the first half of the fifth century A.D., eminent also as a general, has left us a short hymn in honor of Christ, and fragments of five historical poems. L. Jeep in his edition of Claudian (Leipsic 1876-1879) publishes four of these poems.

Merodach, mēr'ō-dāk, or **Bel-Merodach**. See BEL.

Meroë, mēr'ō-ē, Egyptian Sudan, a city and state of ancient Ethiopia, in the north-eastern part of Africa. The city is still represented by ruins and pyramids near Kabati on the Nile north of Khartum, and the state forms the district often spoken of as the Isle of Meroë, extending southeast to Abyssinia, and in the northwest forming a part of Nubia. It was distinguished for its mineral and cereal wealth, and at an early date was the centre of an active and varied commerce including the great caravan trade between Ethiopia, Egypt, Arabia, northern Africa and India. The government was in the hands of a caste of priests, who chose a king who was obliged to live and act according to certain prescribed rules. The priests could sentence the king to death in the name of the gods, and he was forced to submit. The priests were of a lighter complexion than the other inhabitants, and may have come from India. Ergamenes, king of Meroë in the 3d century B.C., during the reign of Ptolemy II, in Egypt, first made himself independent of this oppressive priesthood by murdering the priests in the golden temple. Meroë and Axum (in Abyssinia), which appears to have been a colony of Meroë, remained the centre of the southern commerce till the time of the Arabians. The existing monuments of their architecture, and many other vestiges, exhibit an advanced religious and social cultivation.

Merosto'mata, a sub-class of arthropods, allied to the *Crustacea*, and represented by only a single survivor (the horsefoot crab), but including a large series of fossil forms which flourished in the Palæozoic Age. They were somewhat scorpion-like in form, although sometimes of gigantic size, and ranked between the superior trilobites and inferior arachnids. The Merostomata are characterized by having six pairs of ambulatory limbs about the mouth, the first of which terminate in some, if not in all, cases in chilicera. The others serve as organs of locomotion, and their coxal joints for prehension and mastication. The prevailing opinion is that the body is divided into two parts (cephalothorax and abdomen) instead of three (head-shield, thorax and abdomen). The sub-class comprises three orders, *Xiphosura*, the horsefoot crabs (q.v.), several species of which still exist; the *Synxiphosura*, Silurian and Cambrian fossil forms; and *Eurypterida* (see *EURYPTERUS*). Consult Packard, 'Zoolo-gy' (1897), and Zittel-Eastman, 'Text-book of Paleontology,' Vol. I. (1900), which contains an extensive bibliography.

Merovingians, mēr-ō-vīn'jī-anz, the first dynasty of Frankish kings which ruled in the northern part of Gaul, since called France. They derived their name from Merowig (Merovæus), the grandfather of Clovis. They ruled from 496 till 752, when they were supplanted by the Carolingians. See FRANCE.

Merriam, mēr'ī-am, Clinton Hart, American biologist and author: b. New York city, 5 Dec. 1855. He was graduated from Yale in 1877 and from the College of Physicians and Surgeons in New York in 1879, and practised medicine, 1878-85. He was United States Bearing Sea commissioner in 1891 and visited Alaska in the interest of fur seal investigations. He has held various commissions from the government in the field of biology and has made explorations in its interest in the far West. He has written: 'Birds of Connecticut' (1877); 'Mammals of the Adirondacks' (1882-4); 'Results of Biological Survey of San Francisco Mountain Region and Desert of Little Colorado in Arizona' (1890); 'Flora and Fauna of the Death Valley Expedition' (1893); 'Life Zones and Crop Zones of the United States' (1898).

Merriam, Henry Clay, American soldier: b. Houlton, Maine, 13 Nov. 1837. He was graduated from Colby University, and began the study of law; but in 1862 entered the Union army as captain in a Maine regiment. He was at the battle of Antietam in 1862, and organized the colored troops in 1863, being lieutenant-colonel of the Louisiana Native Guard (a negro regiment) at the close of the war; he led the assault on Fort Blakely 9 April 1865, and obtained a medal of honor from Congress for gallant conduct. In 1866 he was appointed major in the regular United States army, and rose to the rank of brigadier-general in 1897 and major-general of volunteers in the Spanish War, 1898. He served in many expeditions against the Indians, and protected American citizens in the valley of the Rio Grande in the revolutionary troubles (1873-6). In 1898 he was commander of the departments of the Columbia and California, and organized, equipped and forwarded the troops to the Philippines; and in 1899 was sent to the Philippines in command of

the army of occupation. In January 1900, he was placed in command of the Department of the Colorado, and in 1901 was retired from active service. He is the inventor of the Merriam infantry pack.

Merriam, William Rush, American financier: b. Wadham's Mills, N. Y., July 1849. He was graduated from Racine College, Wisconsin, in 1871 and entered the First National bank of St. Paul where he was cashier in 1873. In 1880 he was president of the Merchants' National bank there and in 1882 became a member of the State legislature of Minnesota and was speaker in 1886. He was elected governor of Minnesota in 1889 and was director of the United States Census in 1898-03.

Merrick, mēr'ik, Leonard, English novelist: b. Belsize Park, London, 21 Feb. 1864. He was educated at Brighton College, and among his novels, several of which have been reprinted in this country, are: 'Mr. Bazalgette's Agent'; 'The Man Who Was Good'; 'Cynthia: a Daughter of the Philistines'; 'When Love Flies Out of the Window.' He is also the author of several plays.

Merrifield, mēr'ī-fēld, Webster, American educator: b. Williamsville, Vt., 27 July 1852. He was graduated from Yale in 1877 and was an instructor there 1879-83. From 1884 to 1891 he was professor of Greek in the University of North Dakota, becoming professor of political economy and president of the institution in 1891.

Merrill, mēr'il, George Edmands, American Baptist clergyman and educator: b. Charlestown, Mass., 19 Dec. 1846. He was graduated from Harvard in 1869, and from the Newton Theological Seminary in 1872. Entering the Baptist ministry, he was pastor at Springfield, Mass. (1872-7); at Salem, Mass. (1877-85); at Colorado Springs (1885-7); and at Newton, Mass. (1890-9). In 1899 he was called to the presidency of Colgate University, Hamilton, N. Y., where his administration has been of a constructive nature, improving the standard and awakening interest in many new lines of college activity. He has written 'Story of the Manuscripts' (1881); 'Crusaders and Captives' (1890); 'The Reasonable Christ' (1893); 'The Parchments of Faith' (1895).

Merrill, Lewis, American soldier: b. New Berlin, Pa., 28 Oct. 1834; d. Philadelphia 27 Feb. 1896. He was graduated from West Point in 1855, and at the outbreak of the Civil War was appointed colonel of a volunteer cavalry regiment and served with distinction through the war. He was active in warfare with the Indians and performed the notable service of breaking up the Kuklux Klan in 1868, which was recognized by Congress after some delay by promotion to the rank of lieutenant-colonel of cavalry.

Merrill, Selah, American Congregationalist clergyman and archæologist: b. Canton Centre, Conn., 2 May 1837. He was educated at Yale and at the New Haven Theological Seminary and was ordained to the ministry in 1864 when he entered the Federal army as chaplain. He held pastorates in Leroy, N. Y., and in San Francisco, and was for a time professor of Hebrew at Andover Theological Seminary. In 1882-6, 1891-4 and since 1898 he has been United

States consul at Jerusalem and has made valuable archaeological researches and discoveries there. He has written: 'East of the Jordan' (1881); 'Galilee in the Time of Christ' (1881); 'The Site of Calvary' (1885); etc.

Merrill, Stephen Mason, American Methodist bishop: b. Jefferson County, Ohio, 16 Sept. 1825; d. Keyport, N. J., 12 Nov. 1905. He studied for the ministry and was ordained by the Ohio Conference in 1846, and in 1868-72 was editor of the 'Western Christian Advocate.' In 1872 was appointed bishop. He published: 'Christian Baptism'; 'Union of American Methodism'; 'Sanctification' (1901); 'Miracles' (1902).

Merrill, William Emery, American military engineer: b. Fort Howard, Wis., 11 Oct. 1837; d. near Edgefield, Ill., 14 Dec. 1891. He was graduated from West Point in 1859 and for a year prior to the outbreak of the Civil War was assistant professor in engineering at West Point. He went to the front in 1861, and served with distinction at Yorktown, Chickamauga, Missionary Ridge and other famous battles and in 1864-5 had charge of the railroad which supplied the armies in Georgia and Tennessee and was brevetted colonel for his services. After the war he served as chief engineer on the staff of General Sherman and was engaged in western surveys and the improvement of rivers. He was in charge of the improvement of the Ohio River at the time of his death which occurred on a railroad train. He wrote 'Iron Truss Bridges for Railroads' (1870) and 'Improvement of Non-Tidal Rivers' (1881).

Merrill, Wis., city, county-seat of Lincoln County; on the Wisconsin River, and on the Chicago, Milwaukee & Saint Paul railroad; about 145 miles north of Madison. It was settled in 1875 and incorporated in 1880. It is in a part of the State where the chief industries are connected with lumbering. Merrill has manufacturing establishments for shingles, laths, planed lumber, sawed lumber, sash, doors, and blinds, clapboards, lumber for interior finish, flooring, etc. It has a high school, an opera house, a court-house which cost about \$100,000, and the T. B. Scott Public Library. Pop. (1890) 6,809; (1900) 8,537.

Merrimac, mēr'ī-māk, a river of New Hampshire, which has its source at Franklin where the Pemigewasset and Winnipisaukie rivers unite. The Winnipisaukie is the outlet for the lake of the same name; the Pemigewasset has its rise in the northern part of Grafton County, in the White Mountains. The Merrimac flows nearly due south into the State of Massachusetts when it turns, continuing its course east, then northeast to the Atlantic Ocean. The mouth of the river is a tidal estuary which is navigable for steamers of good size. At the entrance is a sand bar which is constantly changing, and which is a hindrance to navigation. The river is navigable for small steamers as far as Haverhill. The extensive water-power of the Merrimac made it one of the most important rivers of the country when the chief motive power for machinery was water. The largest cotton-mills of the country were erected on its banks, and many woolen mills, carpet mills, and other manufactories. Newburyport is at the mouth of the river. Other important places on its banks are Haverhill,

Lawrence, and Lowell, in Massachusetts, and Nashua, Manchester, and Concord in New Hampshire. The length from the source of the Pemigewasset to the ocean is 183 miles.

Merrimac, The, a frigate of the United States navy. See MONITOR and MERRIMAC, THE.

Merriman, mēr'ī-man, **Henry Seton**. See SCOTT, HUGH STOWELL.

Merriman, Mansfield, American civil engineer: b. Southington, Conn., 27 March 1848. He was graduated from Yale in 1871 and in 1872-3 was assistant engineer in the United States corps of engineers. He was instructor in civil engineering at Sheffield Scientific School, Yale, in 1875-8 and since 1878 has been professor of civil engineering at Lehigh University. In 1880-5 he was also a member of the United States Coast and Geodetic Survey. He is a member of many scientific societies, and has published: 'Theory of Continuous Bridges' (1876); 'Mechanics and Materials' (1885); 'Treatise on Hydraulics' (1889); 'Precise Surveying and Geodesy' (1899); etc.

Merriman, Titus Mooney, American Baptist clergyman: b. Charleston, P. Q., 23 April 1822. He was graduated from Canada Baptist College, Montreal (now McMaster Hall, Toronto), in 1844, served in the United States Christian Commission during the Civil War, and became a naturalized citizen of the United States in 1882. He was a professor at Laselle Seminary, Auburndale, Mass., 1864-95. He published 'William, Prince of Orange' (1874); 'Pilgrims, Puritans and Roger Williams Vindicated' (1892); etc.

Merritt, mēr'īt, **Wesley**, American soldier: b. New York 16 June 1836. He was graduated from West Point in 1860 and served with honor through the Civil War and for bravery at Gettysburg was brevetted major. His services at the battles of Yellow Tavern and Winchester gained for him the rank of brigadier-general and major-general. He was assigned chiefly to frontier duty from the close of the Civil War until 1882 when he was made superintendent of West Point and in 1887 placed on duty at Fort Leavenworth, Kan. He commanded the Department of the East 1897-8 and in May 1898 was put in command of the United States troops in the Philippines and conducted the campaign to a successful termination. After the close of the Spanish-American War he was ordered to Paris in order to assist the work of the American peace commissioners. He was retired from active service in June 1900.

Merry, Robert, English poet and eccentric: b. London April 1755; d. Baltimore, Md., 14 Dec. 1798. He was educated at Christ's College, Cambridge, and studied law at Lincoln's Inn; inherited a good deal of money from his father, but quickly squandered it; and about 1784 settled in Florence, where he was made a member of the Della Crusca Academy, and wrote much sentimental verse, some of it answered by Hannah Cowley. He returned to England in 1787; printed some of his verse, which was sarcastically praised by Walpole and was the butt of Gifford's 'Baviad'; and in 1791 married an actress. In the meantime he had become infatuated with the principles of the French Revolution and had lived in Paris. In 1796 they

came to America, where his wife acted with great success and where Merry was regarded as a very superior poet. 'The Abbey of Saint Augustine,' a play by him, was acted in Philadelphia in 1797.

Merry, William Walter, English Anglican clergyman and classical scholar: b. Worcester-shire 6 Sept. 1835. He was educated at Oxford and has been rector of Lincoln College there from 1884. In 1861 he became vicar of All Saints Church, Oxford, was select preacher to the University 1878-9, and again in 1880, and public orator in the University in 1880. He is widely known for his editions of the classics published by the Clarendon Press and including the 'Odyssey' (Books I. to XII., 50th thousand; XIII. to XXIV., 15th thousand); and the plays of Aristophanes. He is the author of 'The Greek Dialects' (1875).

Merry England, a popular name for England. The word merry is used, not in the sense of gaiety, but according to its earlier meaning, that is, agreeable, or pleasant; as in the phrase, "merry month of May."

Merry Mount, a district near the present town of Quincy, Mass., which in the early colonial days of New England was occupied by a party of men belonging to the Church of England. They paid little respect to the rigid and austere habits of the Puritans whom they greatly offended by the laxity of their manners. An attack was made upon this settlement by the forces of the Plymouth colony in 1630. John Lothrop Motley, the historian, produced in 1849 a romance entitled 'Merry Mount.'

Merry Wives of Windsor, a comedy by Shakespeare, first produced about 1600 and first printed in its present form in the 'First Folio' of 1623. An imperfect quarto edition appeared in 1602. According to Rowe it was written at the request of Queen Elizabeth, who wanted to see Falstaff in love, but there is no proof of this. An opera by Nicolai with words adapted from Shakespeare by Mosenthal was brought out in Berlin in 1849. It was entitled 'Die lustigen Weiber von Windsor.'

Mersey, mēr'zī, England, a river rising in the range of hills on the southwest confines of Yorkshire, at the point where Cheshire and Derbyshire join the former. It flows in a general southwest direction to Runcorn, where it expands into an estuary two to three miles broad, near the mouth of which, on the north side, is Liverpool, with Birkenhead opposite, and below which it joins the Irish Sea. Since 1886 a railway tunnel under the Mersey has afforded communication between Liverpool and Birkenhead. The entire length of the river, including the estuary, is from 55 to 60 miles. Principal affluent, the Irwell, to which it is navigable. The Bollin and the Weaver are affluents from Cheshire. With the Mersey and Irwell is now closely connected the great Manchester ship-canal (q.v.) which opens into it.

Merson, Luc Oliver, French painter: b. Paris 21 May 1846. He studied at the Ecole des Beaux Arts and was a pupil of G. Chassevent and of Pils. His first picture exhibited in the Salon was 'Leucothea and Anaxandros' (1867). In 1869 he carried off the Grand Prix de Rome, the supreme ambition of art students, by his painting 'The Soldier of Marathon.' He pro-

duced the same year 'Apollo the Destroyer,' now in the Museum of Castres. In 1872 he painted 'The Martyrdom of Saint Edmund of England' (Museum of Troyes). Since then he has devoted his pencil to the portrayal of legendary and mythological scenes and incidents. His chief works in this class are: 'The Vision, a Legend of the 14th Century' (1873); 'A Patriot Sacrifice' (1874); 'Saint Michael' (1875); 'Saint Francis and the Wolf of Agubbio' (1878); 'Saint Isidore' (a triptych) (1879); 'The Judgment of Paris witnessed by Eros' (1884); 'Mankind and Fortune' (1892). He has also frescoed with scenes from the life of Louis IX. the walls of the St. Louis gallery in the Palais de Justice at Paris.

Merthyr-Tydfil, mēr'thēr-tid'vīl, or Tydvil, Wales, a market and manufacturing town of Glamorganshire, 24 miles by rail northwest of Cardiff, on the Taff, at the northern end of Taff Vale. From an unimportant village in 1780, Merthyr-Tydfil has become a prosperous centre of steel and iron manufactures, owing to its situation near the valuable coal and mineral fields of South Wales, its exports of these various products being considerable. The town has undergone much modern improvement and is noted for its municipal enterprises. Pop. (1901) 69,227.

Mer'ton, Walter de, English bishop: d. 27 Oct. 1277. He was graduated at Oxford University, of which he was appointed chancellor by Henry III. in 1261, and three years later instituted the collegiate, or separate house system of the English University, by establishing the college which is called after his name. Here the secular clergy were to be educated in philosophy, the liberal arts and theology. The system he thus introduced has been the secret of success both to Oxford and Cambridge, and was originated chiefly with the object of raising up secular schools which might check the power of the monasteries and eventually supersede them as centres of education. He was appointed bishop of Rochester in 1274.

Merton College, Oxford, England, was originally founded in 1264 at Malden, Surrey, by Walter de Merton (q.v.), and removed to Oxford in 1274, where its collegiate buildings are among the oldest and most interesting in the city, the chapel especially being noted for its proportions and beauty. The foundation consists of a warden, twenty fellows, eighteen post-masters or scholars, ten exhibitors, four lecturers, two chaplains, and in 1902, 150 undergraduates. Among its famous alumni are Harvey, Anthony Wood, Sir Thomas Bodley, and Sir Richard Steele.

Meru, mēr'oo, in Hindu mythology, the sacred mountain on whose summit resides Siva, sustaining and uniting earth, heaven, and hell.

Merv, mērv, Russia, an oasis in Central Asia, in the south of Western Turkestan, and about 120 miles north of the frontier of Afghanistan, now traversed by the railroad from the Caspian to Samarkand. It is watered by the Murghab, and produces wheat, cotton, sugar, silk, etc. In the midst of the oasis are the ruins of the ancient town of Merv, founded by Alexander the Great, and subsequently held by Syrians, Arabs, Mongols, and Persians. A new town has grown up on the Murghab, where the

railway crosses the river, with a citadel and 10,000 inhabitants. The oasis generally is the principal seat of the Tekke Turcomans, who from this centre used to make predatory incursions into Persia and Afghanistan. In 1815 the oasis was subjugated by the Khan of Khiva, to whom it remained tributary for about 20 years. Subsequently Persia attempted to make good the claims which it had long made to this district, and in 1860 fitted out an expedition for the purpose, which, however, miscarried completely, as did another expedition in 1876. In 1881 General Skobelev led a Russian expedition against the Tekke Turcomans, captured their stronghold of Geok-Tepe, and received the submission of their principal leader. The district of Merv subsequently came under the power of Russia. Merv is of great strategical importance, and considerable interest was attached to it in connection with the advances made by Russia in the direction of India. Pop. 200,000.

Mer'win, Henry Childs, American lawyer: b. Pittsfield, Mass., 5 Aug. 1853. He was graduated from Harvard in 1874 and was for some years lecturer in the law school of Boston University. Beside editing several legal works he is the author of 'Patentability of Inventions' (1884); 'Road, Track and Stable' (1893); 'Life of Aaron Burr' (1899); 'Life of Thomas Jefferson' (1901).

Merwin, Samuel, American author: b. Evanston, Ill., 6 Oct. 1874. He was educated at Northwestern University (Evanston, Ill.), and published with H. K. Webster (q.v.) 'The Short Line War' (1899), and 'Calumet K.' (1901), independently 'The Road to Frontenac' (1901) and 'The Upper Hand' (1903).

Meryc'odus, or **Cosoryx**, a small antlered antelope fossil in the Miocene formations of the western United States. It was about the size of a dorcas gazelle, but with shorter limbs and neck and belonged to the family *Antilocapridæ*, now represented only by the pronghorn (q.v.); but it bore relatively tall three-tined antlers, which were deciduous and precisely like those of deer. Minute lateral toe-rudiments hung high above all the hoofs, but these were relatively smaller than in deer; in the modern pronghorn no trace of these remains. It was probably a collateral ancestor of the antelopes. *Blastomeryx* is a closely related genus somewhat more primitive. A very complete skeleton, collected by W. D. Matthew, is exhibited in the American Museum of Natural History at New York.

Méryon, Charles, shârl mǎ-rê-ôn, French etcher: b. Paris 23 Nov. 1821; d. Charenton 14 Feb. 1868. He entered the navy, after studying at Brest, but failing health forced his resignation, and he settled in Paris, studying etching there. His chief works were picturesque spots in old Paris, many since destroyed. A series of 23 plates by him appeared 1850-4. His last years were spent in an insane asylum at Charenton. Consult Wedmore, 'Méryon and Méryon's Paris' (1879); Burt, 'L'Euvre de Charles Méryon,' translated by Huish (1879); Bouvenne, 'Notes et Souvenirs sur Charles Méryon' (1883).

Me'sa, a table-land, or plain; a term common in southern California and Mexico.

Mescal, a fiery liquor produced in Mexico from several species of *Agave* (q.v.). The most

famous liquor however is made from the "hearts" of the species recently described as *Agave tequilana*. The city of Tequila, in the state of Jalisco, is the centre of this particular industry. The Tequila *Agave* resembles in the appearance of its stiff lance-like leaves the sisal hemp plant, though it sends out its leaves from a great bulb-like cellular mass which forms the heart of the plant. This heart, when denuded from its leaves and detached from the root, is cleft in two, and a dozen of these pieces make a fair load for a mule, for they must be transported from the fields where grown to the city, sometimes a journey of several miles. These hearts are roasted in pits, within the distillery enclosures, dug four or five feet deep and considerably wider. A hot fire is built of mesquite wood, and large stones distributed through the fuel. The "heads" are then heaped over the burning mass until a huge mound is formed, which is covered first with grass and then with earth, and the mass left several days to cook. When the mound is opened the raw product is found to have changed to a dull brown in color, and the juices to have been converted into sugar. While hot and steaming the mass is taken to another pit, stone-paved, on the bottom of which revolves a heavy stone crusher, driven by a sweep and mule power. Here it is ground into pulp, and the semi-liquid mass carried in deep trays on the heads of Indians to the vats where it remains to ferment. Then it goes to the rude stills, and is run off as mescal.

The commercial mescal is a colorless liquor sometimes with a slight amber tint, though much of it is like alcohol. Some of the higher grades are given fancy names which serve as trademarks. It is far too strong a liquor to be drunk by Americans with impunity, though its fiery quality seems to suit the Mexican taste for hot things. Zotol is another liquor, made in the same way from the bulb-like heart of a species of *Dasylium*, which is said to be as strong as 95 per cent alcohol. These liquors should not be confounded with aguardiente, which is made from sugarcane. The Mexican name means burning water.

CHARLES RICHARDS DODGE.

Mesca'la. See MEXCALA.

Mesdag, mës'däg, Hendrik Willem, Dutch marine painter: b. Groningen 23 Feb. 1831. He was a banker, following in his father's footsteps, until his 36th year, when he devoted himself to art, studied under Alma Tadema, who was a relative, and under Roelofs, and lived at The Hague, with a studio at Scheveningen. He takes a foremost rank among modern painters of the sea, and conveys the idea of water-masses and motions very felicitously. The report circulated in American newspapers of his death 4 Aug. 1902 was false. Mesdag's pictures include 'Fishing Boats at Scheveningen,' 'Strand of Scheveningen,' 'Morning on the Scheldt,' 'In Peril,' and many other views of the North Sea. Consult Zilken, 'H. W. Mesdag' (English version by Bell, 1896).

Meshed, mësh'ed, or Messhed, mësh'hëd, Persia, capital of the province of Khorasan, in an extensive valley 500 miles northeast of Ispahan. It is surrounded by walls, and has many ruinous houses, but its principal street is spacious and handsome, having a water-course, the banks of which are shaded by trees, passing

through it, while at its extremity are seen the splendid cupola and gilded minarets of the mosque containing the shrine of Iman Riza, the son of Ali, the founder of the Shiites. This tomb has a gorgeous interior, a vast hall, like the central nave of a cathedral, rising loftily into a central dome ornamented with the richest colors and a profusion of gilding. This shrine attracts a vast number of pilgrims. Here also is the mosque of Gohur Shah, considered one of the most beautiful and splendid in Persia. The chief manufactures are velvets, sword-blades, and some silk and cotton goods. A considerable number of the inhabitants are employed in cutting the turquoises obtained in the vicinity. The situation of Meshed on several great caravan routes makes it an important entrepôt for the produce of surrounding countries. Pop. est. 61,500.

Mesmer, Friedrich (or Franz) Anton, fréd'rih än'tôn mës'mër, German physician: b. Itzmang, near Constance, Baden, 23 May 1733; d. Meersburg, Baden, 5 March 1815. He was educated in medicine by Van Swieten and De Haen of the University of Vienna, made some study of astrology, came to believe in the influence of the stars, and attributed this supposed influence to magnetism. Having at first believed in the cure of diseased bodies by the use of magnets, he came wholly to discard the magnets and declared that an occult force, which he called animal magnetism, pervading the universe, resided in himself and afforded him an influence over others. In 1778 he went to Paris and set the town astir. He had undoubtedly an honest belief in the efficacy of his discoveries and the reality of the phenomena displayed; but he took advantage of popular interest to enshroud his methods with mystery. Finally the government appointed a committee of noted physicians and members of the Academy of Sciences, including Benjamin Franklin, to investigate the matter; and the committee in a report admitting many facts but attributing them to physiological causes and not to any such supposed agency as animal magnetism, so discredited Mesmer that he went to London, and later to Germany. The name mesmerism was formerly applied to the entire class of phenomena now known as Hypnotism (q.v.). Among his writings are 'Mémoires sur la Découverte du Magnétisme Animal' (1779); 'Histoire Abrégée du Magnétisme Animal' (1783); and the 'Mémoire de F. A. Mesmer sur ses Découvertes' (1799). See MESMERISM; HYPNOTISM.

Mesmerism. See ANIMAL MAGNETISM.

Mesne (mën) Process, in law, an intermediate process which issues pending the suit upon some collateral interlocutory matter. Sometimes it is put in contradistinction to primary and final process, or process of execution, and then it signifies all such processes as intervene between the beginning and end of a suit.

Mes'oderm. See ANATOMY, COMPARATIVE; EMBRYOLOGY.

Mesohip'pus. See HORSE, EVOLUTION OF.

Mes'onyx, a primitive carnivorous animal of the group called *Creadonta* (q.v.), which must have resembled in external aspects, when alive, the modern Tasmanian wolf of Australia. Its remains are found fossil in the fresh-water formations of Eocene Age along the eastern base of

the Rocky Mountains, and a complete skeleton is mounted in the museum of Princeton University. This specimen (*Mesonyx obtusidens*) indicates an animal as large as a St. Bernard dog, with its hindquarters drooped somewhat, like those of a hyena. Consult Woodward, 'Vertebrate Palæontology' (1898).

Mes'ophyte (Gr. "mid-grower"), in botany and forestry, a term used of plants which grow naturally in soil of moderate moisture. Thus the term is contrasted on the one hand with xerophyte, "dry-grower," and hydrophyte, "wet-grower," these latter terms being applied to plants requiring very little or very much moisture. Since soil of moderate moisture varies from moist to dry, whereas both the dryer and wetter soils are comparatively invariable in this respect, it naturally follows that Mesophytic plants show more adaptability to conditions of moisture than either hydrophytes or xerophytes. For the same reason, no doubt, the mesophytic flora, being comparatively stronger, is denser and marked by much wider variations of species, than the scanty and monotonous growths of poorer, because wetter or dryer, soils.

Mesopotamia, mës'ô-pô-tà'mi-ä (Gr. *mesos*, middle, and *potamos*, river, signifying the land between the rivers, and called by the Arabians *Al Jezireh*, or the island), Turkey. The Greeks called by this name the extensive region enclosed by the Tigris and Euphrates, and bounded on the north by the Taurus and Masius; but the name is generally applied to the northern part of this region, which is mountainous, and rich in grain, wine, and pasturage; the southern part being flat, dry, and unfruitful. Its Old Testament name is *Aram Naharaim*, or Syria of the Two Waters; and also *Padan Aram*, or Syria of the Plain. It is mentioned in the Old Testament in connection with Isaac and Jacob (Gen. 24 and 27). The Greek title was probably not in use till after Alexander the Great invaded the East. This country has always been inhabited by husbandmen, who live a settled life, and by shepherds, who wander from place to place. The Mesopotamians sprang from the Chaldeans, the primitive inhabitants; from the Cushites, who in the reign of Nimrod built the cities of Edessa and Nisibis; and from the descendants of Shem, of the tribe of Thara. It was originally a part of Nimrod's dominion. After an interval of more than 700 years (2000 B.C.) Cushan Rishathaim reigned in Mesopotamia, who extended his dominion over the Euphrates. The Israelites, who then possessed Palestine, were compelled to pay him tribute for the space of eight years. In the golden age of the Assyrian power (790 B.C.) Mesopotamia was entirely subjected to that empire, and suffered the fate of its subsequent conquerors. Trajan subjected it to the dominion of Rome 106 A.D., but the Persians did not suffer the Romans to remain long in undisturbed possession of it. It was a constant cause of war between the Persian and Roman empires, and at last Jovian surrendered it to the Persians, 363 A.D. When the Arabs in 651 established a new empire upon the ruins of the kingdom of the Sassanids, Mesopotamia was also obliged to submit to the storm. In the year 1040 it fell into the hands of the Seljuks. From that time it had many rulers in rapid succession. Genghis Khan made himself master of it in 1218, but in the year 1360 it fell

MESOZOIC ERA — MESSENIA

into the hands of Tur Ali Bey. Forty years afterward Mesopotamia was conquered by Timur, and in 1514 Ismael Sophi incorporated it with the Persian empire. The Persians were, however, in 1554 compelled to cede more than half of it to the Turks; and though they again in 1613 recovered the lost portion, they were unable to withstand the attacks of Amurath IV., who united this in 1637, with many other provinces, to his empire. The people are mostly Arabs, a few Kurds in the north, and some Syrian Christians and Armenians. The people are nearly independent of the Turkish government, although the country is a part of Turkey.

Mesozoic Era, in geology, the mid-period of life in geologic time, also called the Secondary Period. Palæozoic precedes and Cænozoic follows this era, these two terms referring respectively to "older" and "newer," or "earlier" and "later," forms of prehistoric life. The mid-period is marked by the great development of reptilian life, and is sometimes styled the Age of Reptiles. The subdivisions of the Mesozoic are Triassic, Jurassic, and Cretaceous (qq.v.).

Mesquita, mäs-kê'tä, Salvador d., Brazilian poet: b. Rio de Janeiro 1646; d. Rome, in the early 18th century. He went to Rome, where he entered holy orders, and was well known for his Latin scholarship. His 'Sacrificium Jephthæ' (1680), a sacred drama, established his poetic fame among contemporaries. His tragedies from profane history, 'Demetrius,' 'Perseus,' and 'Prasias Bithyni,' all appearing at Rome between 1690 and 1700, also had once high rank.

Mesquite (mēs kēt') Tree, Algaroba, Honey Pod, Honey Locust, or Cashaw, a shrub or tree (*Prosopis juliflora*) of the natural order *Leguminosæ*. It is a native of the arid southwestern United States, extends southward to Argentine Republic and Chile, and is found in the Hawaiian Islands, where it was introduced by the missionaries. When well supplied with water it often becomes a widespread tree of sixty feet in height and three feet in diameter, but ordinarily it is a straggling shrub only a few feet tall. It is usually spiny, bears pinnate leaves, small flowers in cylindrical spikes, and numerous straight or sickle-shaped pods about six inches long. The wood is used for fuel, and when large enough, for building purposes, posts, etc., for which, being very durable, it is well adapted. The leaves and tender shoots are valued stock food, resembling alfalfa hay in composition. The pods, which are very saccharine, are also greedily eaten. They should be dried and ground to obtain the greatest value, since the highly nitrogenous seeds are likely to resist the digestive process. A clear or light yellow gum, which oozes from the trunk and branches in tear-like drops, is used in confectionery and in laundries; and a black gum, probably the same mixed with some coloring matter, is obtained from wounds. Being rich in tannin (sometimes containing 20 per cent) it is used with iron compounds for dyeing. In California, the tree is often planted for hedges. A closely related species (*P. pubescens*) known as tornillo, curly mesquite, and screw bean, is a smaller growing tree or shrub ranging from Texas and Mexico to California. It is characterized by its twisted pods only a couple of inches long. Both species are important sources of honey; the flowers being plentiful for about ten weeks.

Mess, in the army and navy, and particularly the latter, a company of officers, or crew of a ship, who eat, drink, and associate together; in military language, a sort of military ordinary, established and regulated by the rules of the service, for all the officers in a regiment, and supported by their joint subscriptions, supplemented by a small government allowance. Similar institutions are extended to the non-commissioned officers of a regiment.

Messala (mē-sā'la) Corvinus, Marcus Valerius, Roman soldier, orator, and writer: b. about 65 B.C.; d. about 2 B.C. He received a part of his education in Athens, returned to Rome before the second triumvirate, and joined the Senatorial party. He fought with Brutus and Cassius at Philippi, 42 B.C., and afterward attached himself successively to Antony and Octavius, served at the battle of Actium, 31 B.C., and the same year was chosen consul. He subdued Aquitania, of which he was made proconsul, and was honored with a triumph. For a time he was a prefect of Rome, and held the office of augur. Messala was the friend of Horace and other distinguished men of the age, a zealous patron of literature and art, notably of the poet Tibullus, and one of the most eminent of Roman orators.

Messalina, mēs-a-lī'na, Valeria, Roman empress. She married Claudius (later emperor) in 38 A.D.; bore him a daughter, Octavia, and a son, Britannicus; proved herself vicious, licentious and vulgar by her many open amours; and in her husband's absence formally married Gaius Silius, whom she attempted to make emperor. Claudius refused or delayed to punish her, and Narcissus, the emperor's favorite, had her put to death (whether with Claudius' knowledge or not is not known) in 48 A.D. Her reputation was whitewashed in Stahr's 'Agrippina, die Mutter Neros' (1880).

Messene, mē-sē'nē, the capital of Messenia in Peloponnesus, founded by Epaminondas (369 B.C.) after his victory of Leuctra over the Lacedæmonians, and situated at the foot of the hill of Ithome, the fortress of which formed the acropolis of the new capital. The latter was surrounded by massive stone walls, flanked with towers, of which there are still considerable remains at the modern village of Mavromati. The Greek Archæological Society, in 1895, excavated a colonnade and other parts of the ancient agora. Messene with its acropolis was, next to Corinth, the strongest city of Peloponnesus. It was supplied with water from a fountain called Clepsydra, the spring of which still exists.

Messenia, mē-sē'nī-a, Greece, a nomarchy in the western part of Morea (Peloponnesus), bounded on the north by Elis and Achaia and Arcadia, on the east by Arcadia and Laconia, on the south and west by the Ionian Sea. The greater part of the surface is a fertile plain, but there are mountainous lands in the east and northeast. Kalamata, the capital, is in the southeast on the Gulf of Koron (Messinian Gulf). When Messenia was a state of ancient Greece its chief cities were Methone and Pylos (Navarino). Later Messene (Mavromati) was the capital, and the strong mountain fortress was Ithome. A ridge of Mount Taygetus separated Messenia from Sparta. Messenia is celebrated for the long struggle of the inhabitants with the Lacedæmonians in defense of their liberty. In the

first Messenian war (743-723 B.C.) the Lacedæmonians, with the Athenians, invaded Messenia. For twenty years the Messenians defended themselves valiantly under their king Aristodemus, who in consequence of an answer of the Delphic oracle which promised them the victory on condition of the sacrifice of a virgin of the royal family, offered his own daughter as the victim. Her lover, to save her life, declared her to be pregnant by himself; and Aristodemus, to prove her innocence, stabbed her with his own hand, and caused her to be opened and sacrificed. The Messenians, though for some time successful, were finally obliged to submit by the loss of Ithome. About forty years after, they again rose, and thus commenced the second Messenian war (685 B.C.), which ended in their entire subjugation. A part of the Messenians emigrated to Sicily, and there founded Messana (see *MESSINA*) on the site of the ancient Zancle (668 B.C.). Those who remained were reduced to the state of helots. After 200 years of servitude they again took up arms. This third Messenian war lasted ten years (465-455 B.C.), and resulted in the expulsion of the Messenians from the Peloponnesus. Epaminondas restored them, gathering together the exiles from the various lands in which they were scattered. Within the space of 85 days, they completed and fortified Messene (369 B.C.), and maintained their independence till the country was conquered by the Romans (146 B.C.). The Messenians remained true to their customs, manners, and language through all changes of fortune.

Messhed. See *MESSED*.

Messiah, The, is a term which is, in John i. 41, and in John iv. 25, but without the article, applied to Jesus of Nazareth, as the appointed king of the Kingdom of God. The Greek word which is the translation of the Aramaic term meaning Messiah, namely *χριστός*, in English Christ, is used of Jesus in this same sense throughout the New Testament. The word Messiah itself is a modified transcription of the Greek word *Messias*. The exact transcription would be *Messias*, as the word appears in the Authorized Version in both the passages cited above, and the form Messiah is due to the influence of the form of the original Aramaic and Hebrew word. For the word which appears in Greek as *Messias*, was, in Aramaic and Hebrew, *מָשִׁיחַ* (*Māsi'ah*). All the forms of the term Messiah, as well as the Greek equivalent, *χριστός*, and the English Christ, mean Anointed One, and refer to Jesus, when applied to him, as God's Anointed King.

In the Old Testament, *מָשִׁיחַ* (*Māsi'ah*) (English Messiah) is used, in a few cases, without the article, and as an adjective, of priests, who were anointed to their office (Lev. iv. 5 and 16, vi. 22). But, in the definite sense of the Anointed One, or the Messiah of Jehovah (the Lord's Anointed), it is used, with a very few possible exceptions, only of kings. Thus, in 1 Sam. ii. 35, it is used of the kings of Israel in general. In 1 Sam. xii. 3 and 5, xxiv. 6 and 10, it is used of Saul; and, in 2 Sam. xiv. 21, xxiii. 1, it is applied to David. In Lam. iv. 20, it denotes Zedekiah, King of Judah; and, in Isa. xlv. 1, it is applied to Cyrus, King of Persia. Two possible exceptions to its use to denote kings may be found in Psa. cv. 15

(quoted in 1 Chron. xvi. 22) and Hab. iii. 13, where it seems to be used to mean the nation of Israel as the priest people of Jehovah, although, even in these cases, it may refer only to the king. In Daniel ix. 25 and 26, it is very difficult to decide the true meaning of this word, because of the great uncertainty in relation to the correct interpretation of these verses. According to the various interpretations which have been given to them this word would mean a high priest, a royal ruler, or that great king of the Kingdom of God known to us as Jesus of Nazareth. It is not certain, however, that both times it is used in these verses it has the same meaning. In Psalm ii. 2, the best and most probable interpretation would make the term denote the great coming king known to us as Jesus the Christ. This is the only passage in the Old Testament in which this term can be taken with any reasonable degree of probability to refer to our Saviour.

In the post-canonical literature, the first clear application of the term Messiah to the great coming king of Israel is found in the Psalter of Solomon, dating from about 63 B.C. In this poetical collection we have a full and clear description of this king and his work under this title. There are, indeed, in the Sibylline Oracles and the Book of Enoch, expressions and terms which must be supposed to refer to the coming and expected king of Israel, but the name Messiah is not used in these writings.

While the pre-Christian use of the term Messiah to denote the divinely appointed and eternal king of the Kingdom of God is thus limited, the Old Testament abounds in statements and teachings relating to this king, and that form of the Kingdom of God in which he is to be ruler and sovereign. In some of the passages relating to this final form of the Kingdom of God it is said that Jehovah himself will be the king, as he was, in reality, in all the history of the kingdom of Israel. See, as examples of passages of this kind, Isa. ii. 2-4, Isa. xxxiii. 22, Ezek. xx. 33, Ezek. xxxiv. 15, Zeph. iii. 15, Zech. xiv. 16. In other passages, in harmony with the idea that, while Jehovah was always the real king of Israel, he was represented in the government by a vicegerent king, his anointed on the throne of David at Jerusalem, it is declared that a great and eternal coming king, who, in some of the passages, is stated to be of the line of David, shall reign as king in the final form of the Kingdom of God. Among the passages of this kind may be cited Psa. cx., Isa. ix. 6 and 7, Jer. xxiii. 5-8, Jer. xxx. 8 and 9, Ezek. xxxv. 23 and 24, Ezek. xxxvii. 24, Hosea iii. 4, Micah v. 2-5, Zech. ix. 9. Just what will be the relation, in person and in nature, between Jehovah and this Davidic king, is not made clear, or even asserted, in the Old Testament.

Independently, therefore, of the use of the term Messiah, there was a natural and sufficient basis in the Old Testament for the widespread belief in regard to the coming of a future Davidic king called the Messiah, which appears to have existed in the time of Jesus. In this belief Jesus himself shared, and this king Messiah, or Christ, he both virtually and formally claimed that he himself was. A virtual claim of this kind is found in Matt. xvi. 17-20, and in the parallel passages, Mark viii. 27-30, and Luke ix. 18-21, and also in the act

done by Jesus, of which we have the record in Matt. xxi. 1-11, and the parallel passages, Mark xi. 1-10, and Luke xix. 29-40. A formal claim of Jesus to be the Messiah is found in John iv. 25 and 26.

The rejection of the claims of Jesus by the Jewish nation, and the continuation in that nation of the belief in a coming Messiah, were the occasion of the appearance in Jewish history of several who claimed to be the Messiah after the time of Jesus. Of all these the one who was most generally received as the Messiah by the nation, and who accomplished the most for his people, was Simon bar Cochba (or bar Kozeba), who flourished 130-5 A.D., in the reign of the Emperor Hadrian. For two years and a half, bar Cochba reigned as king, and, at the head of an army of 200,000 men, defied the might of Rome. But, in the end, he and his nation were both crushed beneath the power of Rome.

The Jews of the present day are not all of the same opinion in regard to the Messianic hope. The conservative, or Orthodox, Jews are still looking for the coming of the Messiah, the great king of the line of David. With the liberal, or Reformed, Jews, so far as the term Messiah is used at all, it is made to stand for a personification of a system of ideas and doctrines, and the coming of the Messiah will be the universal acceptance and the world-wide domination of Jewish ideas and the Jewish religion.

SYLVESTER BURNHAM, D.D.,
Dean of the Theological Seminary, Colgate University.

Messina, mēs-sē'nā, Sicily, town and seaport, capital of the province and on the strait of the same name. Messina is walled, flanked by bastions, and defended by a citadel on the south, and several forts both on the east and west. The harbor is one of the best in the Mediterranean, and so much resembles a sickle that the town took its original Greek name from that implement, called *zancle*. Fronting the harbor is a broad quay called the Marina, adorned with statues and fountains and forming a favorite promenade. The streets of the old town are narrow and dirty, but the modern town, built since the earthquake of 1783, is generally composed of houses of two stories, and has spacious streets, well paved with blocks of lava. Among the public edifices are included nearly fifty churches, many of them of great beauty, and adorned with fine sculptures and paintings. The cathedral is a Gothic structure, with a somewhat heavy exterior, but supported within by vast pillars of granite, supposed to have belonged to a temple of Neptune. The viceroy's palace, the archiepiscopal palace, the senate house, grand seminary, college, large and well-endowed hospital, numerous convents, two theatres, lazaretto, and arsenals, are some of the other buildings worthy of notice. The manufactures consist

chiefly of silk goods. The trade, both transit and general, is extensive. The principal exports are silks, olive oil, linseed and other seeds, oranges, lemons, and other fruits; corn, wine, and spirits; salted fish, licorice, lemon-juice, shumac, essences, rags, brimstone, etc. The tunny and other fisheries are carried on to a considerable extent. In 1901 the exports were \$10,852,164, and the imports were \$4,122,600. Messina has a government university, founded in 1549, which had 692 students in 1901. It has departments of law, medicine, science, and classics. It has also a naval seminary, and a number of elementary schools.

Messina, under the name of Zancle, is said to have been founded 1004 B.C. The Messenians obtained possession 668 B.C. Pop. (1901) 149,823.

Messina, Strait of (Italian, *Faro di Messina*; Latin, *Fretum Siculum*), a channel which separates Sicily from Italy, and connects the Tyrrhenian and the Ionian Sea. It has a length of about 20 miles, and gradually widening toward the south, attains, on the parallel of 38°, a width of 11 miles; but in the north, where it is narrowest, does not exceed two miles. The depth is great, in some parts over 4,000 feet, and a strong current continually running with the tide makes the navigation somewhat difficult, but by no means so formidable as was fabled by the ancients, to whom the rock of Scylla, and the whirlpool of Charybdis, on the opposite side, but at some distance to the south, seemed so dangerous that it was generally believed to be almost impossible to avoid the one without being dashed upon the other.

Mess'mates, Animal. See COMMENSALISM.

Messmer, Sebastian Gebhard, American Roman Catholic prelate: b. Goldach, Switzerland, 29 Aug. 1847. He attended the high school at Rorschach and later the College of Saint George near Saint Gall, afterward entering the University at Innsbruck, Austria. Ordained a priest 23 July 1871, he landed in New York the following October and was appointed professor of theology in Seton Hall College, retaining the position until 1889, in which year he became professor of canon law at the Catholic University, Washington, D. C. On 14 Dec. 1891 he was preconized bishop of Green Bay, Wis., being consecrated 27 March 1892, and assuming charge of his diocese 7 April 1892. He was elevated to the archbishopric of Milwaukee, Wis., 10 Dec. 1903, and on 10 Feb. 1904 took possession of his new see. Archbishop Messmer has been actively interested in the Western Summer School, and recently has devoted much time to the study of socialism, upon which subject he has delivered public lectures. He is the author of 'Praxis Synodalis' (1883), and 'Spinago's Method' (1901), etc. In November 1904, Pope Pius X. sent the pallium to Archbishop Messmer. His diocese (1905) has a Catholic population of about 290,000; 349 priests; 293 churches; 4 seminaries; 149 parochial schools; 7 hospitals; 4 orphanages; 1 infant asylum, and other charitable and educational institutions.

Mestizos, mēs-tē'zōs, or **Metis** (Spanish, mixed). In countries where Spanish Europeans have settled and intermingled with the natives, the descendants are called *Mestizos*. In Mexico the European Spaniards were called *Chapetones*

or *Gachupines*. The pure descendants of Europeans are called *Creoles* (see CREOLES) in similar countries.

Mészáros, Lazar, Hungarian revolutionary soldier and patriot: b. Baja, County of Bács, 20 Feb. 1796; d. Eywood, Herefordshire, England, 16 Nov. 1858. He was first educated for the Church, but subsequently studied law at Pesth. In 1813 he was summoned to join the Hungarian army by the emperor Francis I.; later entered the Austrian army, talking part in the campaigns of 1814-15 against Napoleon, and subsequently in Italy; and several years later was appointed colonel. He was in Italy in 1848, serving as a colonel in an Hussar regiment, when he was chosen by Count Batthyány, who had formed a new Cabinet, for the portfolio of minister of war. Acting in this capacity he was largely instrumental in bringing the Hungarian army to a high degree of efficiency. In September of that year, having gone to the scene of war in the south, he was defeated before the Rascian ramparts of Szent Tamás. When Austria purposed the subjugation of Hungary, Mészáros took command of the Hungarian forces in the north, but on 4 January his army was routed at Kaschu. In April 1849 after the declaration of independence he again took command of the Hungarian forces, but after the defeats at Szöreg and Temesvár in August he fled to Turkey. He subsequently lived in England, France, the island of Jersey, and in 1853 came to the United States.

Meta, mǎ'tā, a river of South America, which has its rise on the eastern slope of the Andes Mountains near Bogota in Colombia. It is formed by the junction of two small mountain streams, which unite about 40 miles southeast of Bogota; then flows east-northeast into the Orinoco; a course of about 500 miles.

Metabetchouan, mět't'a-bět-choo-än', Canada, a river of Quebec flowing into Lake St. John from the south. It is a broad stream, 90 miles long, and navigable for a considerable distance. The celebrated Falls of Metabetchouan over 230 feet high are near its mouth.

Metab'olism (Greek μεταβολή, a change), the whole series of physico-chemical processes connected with the manufacture of protoplasm and with nutrition and growth. It has been divided into constructive metabolism (anabolism), and destructive metabolism (katabolism). The former comprises the processes by which the substances taken as food are converted into protoplasm, while katabolism is the means by which the protoplasm breaks down into simpler products, such as the excretory or waste matters. Metabolism thus comprises the elementary vital phenomena of plant and animal life. These are the occurrences associated with changes of substance, of form, and of energy. All organisms undergo continual changes of their substance or protoplasm, etc., alterations of their form, and transformations of their energy. Thus as regards food, since all living matter is continually undergoing decomposition, it must take in substances that contain all the chemical elements of which it is constructed, but the food differs with every form of cell. Plants live on inorganic substances and animals on organic, that is, material already prepared; no animal being able to live on simple inorganic compounds. Among

animals there is a remarkable adaptation to a single kind of food. For example the larva of the fur-moth lives exclusively upon the hairs of fur, which consist of pure keratin; this substance, which is closely allied to proteid, is therefore capable of furnishing all the elements necessary for the formation of the protoplasm of this caterpillar. Dogs when worked hard have been found to be able to live on pure proteid food. On the other hand, according to Verworm, it is impossible for an animal to live solely on carbohydrates or fats, or even on the two together, since there is no nitrogen in these substances.

Vital motion or metabolism is a complex sharply characterizing living organisms, and the taking in of food and the excretion of waste products give to the organism the material with which to regenerate itself and to grow. Metabolism is increased by heat, the consumption of oxygen being increased in cold-blooded animals, but warm-blooded animals undergo a decrease under heat. Thus man in winter has a much more active metabolism than in summer, since he consumes more food at low temperatures.

It is claimed by Verworm that every species of animal possesses a specific metabolism, and that under certain conditions products of metabolism may stimulate an animal to increased growth, while under other circumstances they may retard growth. Thus the usually deadly uric acid in moderate amounts exerts a favorable influence on the size of larvæ of sea-urchins. Illustrations are afforded by experiments in raising snails and water-fleas (*Daphnia*) in small volumes of water; besides the diminished volume, the water fouled by their excretions may not only dwarf but gradually kill them, or produce changes of form.

Consult Verworm, 'General Physiology' (New York, 1899); Vernon, 'Variation in Animals and Plants' (New York, 1903).

Metacentre, in mathematics, the point of intersection of the vertical line passing through the centre of gravity of a floating body in *equilibrio*, and a vertical line through the centre of gravity of the fluid displaced, if the body be turned through a small angle, so that the axis takes a position inclined to the vertical. If the metacentre is above the centre of gravity, the position of the body is stable; if below it, it is unstable.

Metachro'sis, the change of color brought about in the surface of certain animals, either voluntarily or involuntarily, to make them conform to their surroundings. It is exhibited in many of the lower animals as a protective device, especially in cuttlefishes, caterpillars, various amphibians, especially frogs, and certain lizards, notably the chameleons. The dark pigment to which the brown or gray colors of metachroic caterpillars are due is deposited in the cells of the outer skin, while the green coloring matter is found in the underlying fat; and, as Carpenter says, experiments have shown that the presence or absence of both kinds of pigment is determined by the surrounding objects through the quality of the light reflected from them, the suppression of the superficial dark pigment allowing the deeper green to show through the skin, and thus give its hue to the caterpillar. It has been shown that the formation of the dark pigment is hindered by the action of certain yellow rays which are absorbed

METACINNABARITE — METAL

by dark objects, but reflected from green leaves and shoots.

The process of change in squids, frogs, etc., through nervous and muscular control of pigment sacs, called chromatophores, is somewhat different, and is explained in the article CHAMELEON. The power possessed by these animals of adapting their color to their surroundings must be of great value in ensuring preservation from enemies. Consult Beddard, 'Animal Coloration' (1892).

Metacin'nabarite, a native sulphid of mercury, occurring amorphously, when it is black or dark gray, or in tetrahedral crystals. To its black color it owes its early popular name, *Æthiops mineral*. Metacinnabarite is found in California.

Metagen'esis, or **Heterogony**, a term proposed by Owen for a form of parthenogenesis. It is that form of alternation of generations (q.v.) of which one generation reproduces only asexually, by division or budding, the other exclusively by laying eggs. A good example is the mode of reproduction of hydromedusæ in which the hydra-like stage gives rise to medusæ, the latter laying eggs. Another case is that of the aphides, whose asexual individuals produce multitudes of young by budding, the next generation consisting of males and females, the latter laying fertilized eggs. An individual of the first generation is called the nurse; one of the second generation the sexual animal.

Another term for this phase of reproduction is heterogony (or heterogenesis), which Hertwig defines as "regressive alternation of generations." He mentions another form of heterogony where two generations with different forms and structure alternate. For example, a hermaphroditic thread-worm (*Ascanis nigrovenosa*) lives in the lungs of frogs; it produces a form (*Rhabdonema nigrovenosum*) which lives in mud, and which lays eggs giving rise to the ascaris of the frog.

Metal. The elements are usually divided by chemists into two classes, metals and non-metals. Formerly the classification was based on physical properties, and the metals were then elements which were opaque, had a metallic lustre and were good conductors of heat; now the division is made on chemical properties, and a metal is defined as an element which has the power to replace hydrogen of acids and form salts, in other words it is a base-forming element. However, no sharp line can be drawn between the metals and non-metals, since some of the elements belong to both classes. Some metals have a high specific gravity, but lithium, sodium, potassium, etc., float on water, and in general the metals of highest specific gravity are least active chemically. Some 45 elements are usually classified as metals.

A mass of any metal is believed to be composed of atoms arranged in molecules, and any change in the arrangement of the molecule means a change in physical characteristics. Thus crystalline structure may be obliterated by rolling or hammering a metal and by the same means the specific gravity may be increased, since the molecules are forced nearer together.

All metals with exception of bismuth are lighter when molten than when cold. Bismuth, like water, reaches its greatest density just before solidifying. The relative specific

gravities of some common metals in the solid and in the liquid state are shown by the following table, compiled by Sir Roberts-Austen:

METAL	Sp. g. of solid	Sp. g. of liquid
Iron (pig)	6.95	6.880
Zinc	7.20	6.480
Tin	7.50	7.025
Copper	8.80	8.217
Bismuth	9.82	10.55
Silver	10.57	9.510
Lead	11.40	10.370

The fracture of metals is not a property, but a feature which gives much information, about the manner in which it cooled, the presence of impurities, etc., and is of great practical value. Thus foundry iron is graded and sold by its fracture, and in smelting copper and refining lead the decisive points in the processes are determined by the fracture of test samples. Slow cooling, as with chemical solutions, helps the formation of large crystals, giving a coarse fracture, while a sudden cooling may prevent the formation of crystals and thus give a fine fracture. Crystalline structure, which determines fracture, may be affected by repeated shocks or vibrations. In this way the wrought-iron chains on railroad cars to prevent accident in case of a coupler breaking may by the jolting of ordinary service become so crystalline as to break when needed. Very low temperatures, as shown by the experiments of Dewar, also affect in a marked manner the crystalline structure of some metals. Any metal is fusible, though arsenic sublimates at 180° C.; it may be fused under the pressure of its own vapor. When heated, metals give a red and finally a clear white color. The temperatures corresponding to these colors are approximately: incipient red, 525° C.; dark red, 700°; incipient cherry red, 800°; clear cherry red, 1000°; white, 1300°; dazzling white, 1500°.

Certain physical constants of some of the metals are shown in the following table, the figures being from Roberts-Austen's 'Introduction to the Study of Metallurgy.'

METAL	Symbol	Atomic Weight	Specific Gravity	Melting Point °C
Aluminum	Al	27.00	2.56	649°
Antimony	Sb	120.00	6.71	632°
Arsenic	As	74.90	5.67	
Bismuth	Bi	207.50	9.80	268°
Cadmium	Cd	111.70	8.60	320°
Chromium	Cr	52.40	6.80	higher than platinum
Cobalt	Co	58.60	8.50	1500°
Copper	Cu	63.20	8.82	1083°
Gold	Au	197.20	19.32	1063°
Iron	Fe	55.90	7.86	1600°
Lead	Pb	206.40	11.37	326°
Magnesium ...	Mg	24.36	1.74	750°
Manganese	Mn	54.80	8.00	1900°
Mercury	Hg	199.80	13.59	—39°
Nickel	Ni	58.60	8.80	1600°
Platinum	Pt	194.30	21.50	1775°
Silver	Ag	107.93	10.53	961°
Tin	Su	119.00	7.29	232°
Tungsten	W	184.00	19.10	higher than manganese
Zinc	Zu	64.90	7.15	418°

The color of a metal depends on its selective absorption of light waves of different wave lengths. Unless the light penetrates the metal, it is reflected and the metal looks white. The

METAL TRADES ASSOCIATION—METAL WORKING MACHINERY

selection of light rays may be from several parts of the spectrum; this is the case with copper which has a reddish hue. Anything which increases the absorption deepens the color. This can be done by reflecting a ray of light many times from two or more surfaces made of a given metal. Silversmiths and goldsmiths accomplish the same result by finely grooving a metal surface. Owing to this absorption of light by a metal the color of the light reflected differs from that transmitted. Thus gold can be made so thin that some light will get through. This light is bluish green, while as we all know, gold looks yellow. Silver is white by reflected light, while the transmitted light is blue.

Malleability is the property that permits a metal to be hammered or rolled into sheets. Ductility that which permits it to be drawn into wire. Both are dependent on the tenacity of the metal, the latter more than the former. The relative malleability and ductility of the principal metals is as follows:

Order	Malleability	Ductility
1	Gold	Gold
2	Silver	Silver
3	Copper	Platinum
4	Tin	Iron
5	Platinum	Nickel
6	Lead	Copper
7	Zinc	Zinc
8	Iron	Tin
9	Nickel	Lead

The mobility of the molecules of a metal is increased by temperature. Thus a coiled nickel wire may be made absolutely straight by suspending a weight from one end and heating the wire to white heat by the flame from an alcohol lamp or Bunsen burner. Zinc at its melting point is brittle, but at a temperature of 150° is quite malleable.

Metals can occlude gases. Thus a given volume of palladium cooled from red heat in hydrogen absorbs 900 times its volume of that gas. Hydrogen passes through red hot iron or platinum, and nascent hydrogen, assisted by atmospheric pressure will pass through a thin plate of cold iron as shown by Deville. A liquid metal can penetrate a solid; a bar of tin rubbed with mercury absorbs enough in a very short time to become brittle. A solid metal may penetrate another when both are cold. This can be shown with plates of gold and lead rolled together and allowed to stand.

For further information about the different metals, see ALUMINUM; ANTIMONY; IRON; LEAD; SILVER; etc.

SAMUEL SANFORD,
Assoc. Editor (Eng. & Min. Journal.)

Metal Trades Association, The National, an association of 220 firms in the metal trade, organized in 1899, for the purpose of resisting excessive demands of labor. The association will not arbitrate any question after a body of employees have declared a strike.

Metal Work, a form of decorative art in which the materials are metal and the methods casting and repoussé. The term includes jewelry (q.v.) and goldsmith's work; hence its materials are often the precious metals and its end, personal adornment. The more intensive use of the word makes it apply to larger work and especially to metal decoration in architecture, apparently a later development in the arts than was the jeweler's trade, which flourished in

classical antiquity, and everywhere seems to have quickly followed the most primary knowledge of metallurgy in industrial evolution. The Middle Ages was the great period of metal work, notably in connection with Gothic art. Even the more valuable metals were lavishly used in this epoch, as before in the Byzantine period, and since in the architecture of the Greek Church, above all in Russia. One of the foremost instances of Italian metal work is to be found in the altars of St. James at Pistoria and of the baptistry of St. John in Florence. Each of these was the work of a line of great artists, whose elaborate work upon them covered more than a century. Cellini (q.v.) was the greatest metal worker of the 16th century. Even more important than this work in silver and gold are the great bronze doors in the Florence baptistry, one by Ghiberti, and another by Pisano, each the product of a score of years of labor and both dating from the 15th century. Wrought iron work began to be used in the 12th century; between the 13th and the 18th centuries in the shape of gates, grilles and screens in ecclesiastical art, and in German locks and hinges of great beauty, it came to its most perfect form. The sepulchral brasses of German, French, and English churches should also be mentioned; see BRASSES, MONUMENTAL.

Metal Working Machinery, a term including practically all machines by which metals are converted into shapes required by modern structural work and the industrial trades. They may be conveniently arranged under the following named classes: Lathes; borers or drills; punches; shears; milling-machines; riveters; drop hammers; bending rolls; rolling machines; presses; planers; saws and special machines.

Lathes are turning machines used to obtain cylindrical surfaces by rotating a bar of metal against a cutting tool. The principal parts are the head stock holding the driving cone and revolving spindle; the tail stock supporting the back centre, and capable of being clamped at any point on the centre line of the bed or frame, and the rest or carriage bearing the tool head. The bar of metal to be worked is fastened to the head and tail stocks and rotated or turned by belts from shafting, or by electric motors, while the rest carrying the cutting tool is moved parallel with the axis of the bar from the surface of which a spiral shaving is removed. These machines are made in a great number of sizes, of which the principal forms may be designated as follows: (1) The Hand Lathe; without self-acting feeding devices for regulating the cutting tool, and in which the operation of turning is performed by hand tools; (2) The Foot Lathe; small and light, worked by the operator's foot and adaptable to work as delicate as that of the watchmaker and jeweler; (3) The Self Acting Lathe; in which the cutting tool is held by mechanical means causing it to move automatically over the object being turned; (4) The Chucking or Face Lathe; for turning cylinders several feet in diameter and many feet in length, such as engine cylinders and the tubing and jackets of large ordnance; (5) The Boring Lathe, used for working on internal cylindrical surfaces. Any lathe may belong to the single geared or back geared type. In the former the machine is not provided with gear wheel attachments to the revolving cone or stepped pulley

METAL WORKING MACHINERY.

1. Shearing Machine.

2. Seventy-two Inch Lathe.

for regulating the speed of the spindle; while in the latter such attachments are provided

150-Ton Fixed Riveter.

Borers or Drills.—Boring machines are of two types, the horizontal and the vertical. The cutting tool is an axially rotating spindle designed to bore or drill cylindrical holes. They vary greatly in size and form; in the number of spindles employed and the manner of their arrangement. In boring large holes, either horizontal, vertical or inclined, such as engine cylinders, tubing for ordnance, and hollow shafting, the machines usually have two or more separate spindles clamped in a cylindrical tool head. They are especially useful as reamers to finish holes made by punches, and also to give exact cylindrical forms to the internal surfaces of hollow castings of any kind.

Punches.—Punching machines are of the single or multiple type, capable of punching one or several holes at a time. They are used for punching rivet holes in boiler and armor plates, plates for girders and other structural metal work. The perforation is accomplished by the thrust of a cylindrical punch under great pressure instead of a rotating spindle. The power employed is steam or hydraulic, generated by individual engines for large and belt-driven machinery for small work.

Shears.—Shearing machines and punches are similar in general construction and operation, excepting that in the former cutting edges which pass each other like the blades of a pair of scissors take the place of the punching tool. Their name and action sufficiently describe the purposes for which they are used.

Milling Machines.—Are of great importance in the manufacture of iron work of small dimensions such as the small parts of sewing machines, rifles and pistols. In general construction, a frame-work carries a spindle actuated by a pulley, and a table upon which chucks or holding devices are arranged. Gear-wheel attachments to the cone pulley provide for changes of speed or greater driving power at the cutters. The advantages gained by their use are as follows: The rotary cutters insure a continuous cutting operation; the outlines of the work and the form of the cutting edges are exactly similar; once adjusted, all work is turned out uniform in size and shape, and any unlimited variety of shapes may be obtained by simply vary-

ing the form of the cutters, while the only special operating skill required is to maintain the form of the cutters, and set the work.

Riveters.—Riveting machines are made in two forms, stationary and portable; the former used in heavy work are operated by steam and hydraulic power, while in the portable form the moving die is actuated by steam or compressed air. They are employed to drive and head hot rivets in boiler work, bridge building and other structural work with results far superior to hand work in rapidity and efficiency. The usual form of construction is a U-shaped frame or yoke. The ends of the arms are provided with dies projecting inwardly, one being fixed while the other has a reciprocating motion. The rivet being placed in the hole is compressed endwise between the dies; the pressure forces the metal of the rivet into the irregular edge of the hole, clamps the plates together and forms the rivet head.

Drop Hammers.—Heavy drop hammers are used for forging purposes and are operated by hydraulic and steam power. They consist of an anvil fixed upon a solid base of steel blocks laid over oak timbers to give elasticity to the machine. Above the anvil vertical housings capped by steel arches support the hammering

Light Drop-Hammer.

ram and the platforms upon which the piston cylinder and other actuating machinery is placed. The largest hammer of this kind was erected in 1891 at Bethlehem (Pa.) Steel Works. Its general dimensions and weight are as follows: Height 90 feet; width 42 feet; weight of anvil and foundation 1,800 tons; weight of housings, steam chests, pressure cylinders and piston about 1,000 tons. Ram 19 feet long, 10 feet wide and 4 feet thick, weighing 100 tons. Lighter forms of drop hammers are actuated by compressed air and are called pneumatic hammers. They are used principally as cornice bending machines.

METALLOID — METALLURGY

Bending Rolls and Benders are used generally in boiler and tank work; the metal plates being drawn by rotation between three rolls arranged in the form of a triangle, their relative adjustment determining the curve to which the plate is bent.

Rolling Machines are used to flatten out metal bars into plates and shapes. As designed at present they accomplish in a short space of time a great variety of work which in times past was turned out by the more laborious and expensive processes of lathe turning and forging. One class is used to manufacture boiler and armor plate, and the general run of heavy sheet metal; while another class produces the thin sheet metal down to the finest grades such as tin-foil.

Tin-foil Rolling Mill.

Presses.—By the use of presses sheet metal is converted into utensils of any desired form. Their action depends on the principle that fluids exert an equal pressure in all directions, and that, if the pressure applied to the plunger of the force pump be multiplied by the square of the diameters of the plunger and the ram, the product will be the pressure applied to the ram. They are operated by steam, hydraulic or other power; are provided with dies between which the sheet metal is pressed into the required form, and are capable of being constructed to exert an unlimited amount of pressure. Forging presses are made in all sizes adapted for uses ranging from the pressing of watch-cases to the forging of steamship shafts, and of armor plates weighing 14,000 tons. They are designed for both hot and cold working metals.

Planers.—Planing machines are used to obtain flat surfaces on metal. There are two types; those in which the motion of the table relative to the cutting tool is rectilinear, and those in which that motion is rotary. In general construction a planer consists of a traversing table on which the work is fastened; a bed to receive the table and guide it in a right line; a cross slide to support the slide rest carrying the tool; standards bolted to the bed and supporting the cross slide, and the mechanical devices for feeding and regulating purposes. The power supplied from shafting by belts is transformed by gear wheel attachments into the reciprocating motion of the table, causing it to slide back and forth between the vertical guides, thus bringing the work against the cutting tool which shaves off successively, side by side, narrow thin strips of metal until a perfectly flat surface is produced. Planers are built in various sizes, the

larger machines being equipped with tables 7 to 8 feet in width and 20 feet long.

Saws.—In metal working, saws belong to the class commonly termed finishing machinery. For cutting plates and bars into shorter lengths they are in extensive use, affording a great economy of time. They are built in a great many sizes and forms, both stationary and portable, equipped with single cutters or cutters arranged in gangs. For cutting off large bars such as steel beams, rails and similar shapes, saws with single cutters are generally used, the object being fastened to a carriage and moved into contact with the edge of the circular cutter. Some machines used for lighter work are so arranged that the circular saws are moved into contact with the bars. The cutters are of two kinds. The friction disks made of soft mild steel, without teeth, measuring about 44 inches in diameter and 3-16 of an inch in thickness, are used for cutting off either hot or cold metal. They are run at a high rate of speed, about 15,000 feet per minute, rim velocity. The toothed cutters vary greatly in diameter and thickness; are made of highly tempered steel, and are used for clean cutting in cold metal. They are usually run at a low rate of speed the rim velocity varying from 130 to 150 feet per minute. Friction disks run at rim velocities between 20,000 and 25,000 feet per minute are called fusion disks, from the fact that the intense heat generated by the friction actually melts the metallic dust ground off by the cutter.

Special Machines.—This term includes an almost endless variety of metal working machinery, capable of enumeration only in a very general way. They are used for special purposes such as making pins, nails, rivets, and pens; the tapping of nuts and the threading of bolts. Although often of very complex construction they turn out work with great rapidity and precision. In its special field metal working machinery has not only replaced hand labor in all countries, and especially in the United States, but by its use, accomplishments have been achieved in structural work such as the building of magnificent buildings and bridges, powerful engines, and mammoth ships, far beyond the capabilities of that which is known industrially as hand labor.

W. MOREY, Jr.,

Consulting Engineer, New York.

Metalloid (Gr. "metal-like"), in chemistry, any non-metallic element. These are 13, namely, sulphur, phosphorus, fluorine, chlorine, iodine, bromine, silicon, boron, carbon, nitrogen, hydrogen, oxygen, and selenium. The distinction between the metalloids and the metals is slight. The former, excepting selenium and phosphorus, do not have a "metallic" lustre; they are poorer conductors of heat and electricity, are generally not reflectors of light and not electropositive; that is, no metalloid fails of all these tests. The term seems to have been introduced into modern usage instead of non-metals for the very reason that there is no hard and fast line between metals and non-metals, so that "metal-like" or "resembling metals" is a better description of the class than the purely negative "non-metals." Originally it was applied to the non-metals which are solid at ordinary temperatures.

Metallurgy. Metallurgy deals with methods of separating metals from their ores and of

METAL WORKING MACHINERY.

1. Planer.

2. Boring and Turning Machine.

METALLURGY

adapting metals to their commercial uses. It had its beginnings when men first wrought the metals; but was long an art rather than a science, in fact only within comparatively recent years has metallurgy had anything like a scientific basis, but to-day it covers a wide range of facts, and the trained metallurgist has a sound understanding of inorganic chemistry, physics and mechanics.

Of all metallurgical processes that of the separation of lead from its ores is one of the oldest. Lead smelting was known to the ancient Hebrews, and Schliemann found silver ornaments on the site of ancient Troy that were so pure as to show that the Trojans knew how to separate silver from lead by cupellation. Lead ores were wrought by the ancient Egyptians perhaps 3,000 years B.C. The ancient Greeks and Romans extracted gold, silver, iron, lead, copper, and tin, and the Romans made brass although they did not extract zinc from its ores. The alchemists of the Middle Ages did a vast amount of experimental work and made important discoveries. Thus Geber in 707 found that a given volume of metallic lead changed to lead oxide shows an increase in weight, but apparently he made little or no attempt to determine the reason for this increase, and like the later alchemists, passed by discoveries that might have been of high scientific value in the search for the fantastic and impossible. It is of interest to note that the study of the action of oxygen and the effects of heat have, more than anything else, extended our knowledge of the metals, that lead has furnished more experiments than any other metal and that the action of oxygen on lead has been more studied by chemists and metallurgists than any other in the whole realm of chemistry.

Metallurgy is the mother of chemistry, but there is to-day no sharp dividing line between the two. Both deal with reactions between elements, and these reactions can be expressed by symbols. Most chemical reactions take place at comparatively low temperatures, generally at or below the boiling point of water, while most metallurgical reactions have to do with much higher temperatures. It is difficult to govern conditions exactly in experiments at temperatures above a red heat, and as a difference of less than 50° in temperature will determine whether or not a given reaction takes place, metallurgical processes have not been developed with the exactness of chemical. Again the brilliant results achieved in organic chemistry during the past 50 years and the attention given that branch of science by investigators have tended to keep down the interest in metallurgy. Recently, however, there has been a change, and men of high skill and great knowledge have been investigating metallurgical problems, and much has been accomplished within the past 20 years. The names of Howe, Roberts-Austen, Mathiessen, and Le Chatelier may be mentioned in this connection. Metallurgy like chemistry has benefited by the applications of electricity, and in particular the electric furnace which permits of high temperatures and a fairly close control of conditions has vastly increased the range of experimental investigation. The study of metals and alloys by the microscope has also given a clearer idea of the constitution of metals, their behavior when cooling from fusion, when sub-

jected to stresses, cold, and particularly of the relations of the metals to each other in alloys.

Metallurgy thus covers the separation of ore and gangue, by mechanical methods (concentration or ore-dressing), the reduction of the ore to the metallic state by heat (smelting), or by methods which use electricity (electrometallurgy), the purification of metals (refining), and the study of the composition of alloys by the microscope (metallography). The methods used for the separation of commercially valuable minerals from the waste rock or gangue, and for the reduction of the ores of the various metals, differ and will not be taken up in detail here. Mention is made of them under the metals. (See ALUMINUM; COPPER; GOLD; LEAD.)

In general it may be said that the metallurgy of an ore depends on the physical character of the minerals and of the rocks in which they occur as well as on the chemical composition of the minerals. Metallurgical processes may be divided into mechanical and chemical. Under mechanical are included the various processes of ore dressing or concentration, the object of which is to separate nearly pure mineral (heads) from what is of little or no value (tailings). In this separation a third product (middlings) is often obtained which may be subjected to further concentration. This separation of mineral from gangue depends on the physical properties of the mineral, generally on its specific gravity, but in certain cases on its magnetism or even on the readiness with which oil adheres to it (Elmore process). The processes which depend on the differences in specific gravity between minerals are divided into two general classes, wet and dry. All the many devices and machines used in wet concentration cannot be mentioned here. In gold mining they include the miner's pan, one of the oldest of concentrating devices; the sluice with cross-pieces or riffles to stop heavy particles of gold, while the lighter clay, sand and gravel are washed over by the water.

In what is called a jig a mixture of heavy and lighter ore and minerals is fed to one compartment of a large box filled with water; by means of a piston a pulsating motion is given the water in the box and thus the minerals in the compartment are stratified, the lighter rise to the top and are removed while the heavier collect at the bottom and are also removed by some mechanical device. Jigs are for separating particles of some size. For the separation of smaller particles (sands or slimes) concentrating tables, or belts of various types are used, the principle common to all being the use of a thin sheet of water which washes off the lighter particles, while by rapid shocks given the belt or table the heavier particles are made to travel against or transversely to the flow of the water, and fall off the table at some distance from the waste rock. Particles of mineral too fine to be caught on tables are separated by running the water holding the fine mineral and waste in suspension through tanks so proportioned that the speed of flow is checked long enough to permit the heavier particles to settle.

Electro-magnetic methods, formerly used only for strongly magnetic minerals such as magnetite, are now, by employing powerful magnets, applied with much success to the separation of minerals differing but slightly in magnetism,

METAMERISM — METAMORPHIC ROCKS

In particular have magnetic methods proved valuable in the concentration of zinc ores, making rich concentrates out of ores that a few years ago could not be worked at a profit. Magnetic concentration is a dry process. Other dry processes depend on differences in specific gravity, a current of air instead of water being the medium used to sort the mineral particles.

The methods of extracting metals directly from the crude ore or from the mechanically separated concentrates fall into three classes: (1) extraction of the metal from oxides, carbonates, etc., by the reducing action of carbon, and the treatment of sulphides by the oxidization of the contained sulphur; (2) the extraction of a metal by getting it in solution and replacing it by another; (3) amalgamation. In the first class come the smelting of all iron, tin, gold, silver, and lead ores. Of replacement methods may be mentioned the precipitation of copper from a solution of copper sulphate by the use of iron, and the precipitation of gold from a solution of its cyanide by the use of metallic zinc. Amalgamation, used in the treatment of an ore containing free gold and silver, consists in bringing a finely crushed ore in contact with quicksilver, when the gold and silver particles form an amalgam with the quicksilver. The progress of electrometallurgy is developing wet processes which aim to separate the metal from the ore by a direct transfer of the metallic atoms or ions.

Most metals are obtained ultimately by the use of heat, either by treating the crude ore or by treating the concentrates obtained by some method of ore dressing. This application of heat may be either for roasting or for smelting an ore. The object of roasting is generally to prepare an ore for smelting by removing sulphur, though it may be the preliminary step, making the ore more porous, to the use of a leaching or lixivation process, such as the leaching of copper ores by a solution of sulphurous acid or the leaching of gold ores by a solution of potassium cyanide. Roasting is done either by piling the ore in heaps with enough wood to start and maintain combustion of the sulphur (heap roasting) or in roasting furnaces. These are of a variety of types but are alike in having means for applying and regulating heat, regulating the supply of air to combine with the sulphur in the ore, and means for mixing and keeping the ore in motion that the reaction may proceed evenly. A perfect dead roast, that is, the complete oxidation of the sulphur in a sulphur-bearing mineral, is seldom obtained. In what is known as chloridizing roasting, the mineral to be extracted is changed to a chloride by adding common salt to the furnace charge.

Smelting is done in furnaces either of the hearth, shaft, reverberatory or closed-vessel types. The commonest type of shaft furnace is the blast furnace used in smelting iron ores. Ore, limestone, and fuel are fed in at the top while hot air is forced through openings near the bottom, the molten iron being led off below. In reverberatory furnaces the fuel is burned in a separate fire-box and its flame is made to play over a horizontal hearth on which the ore lies. Some roasting furnaces give a reverberatory effect and do not smelt simply because a high temperature is not used. Reverberatory furnaces are used in smelting lead and

copper ores. In closed-vessel furnaces the ore is contained in a pot or similar receptacle made of a silicious clay or other infusible material and the heat applied externally. Furnaces of this sort are used in smelting zinc ores.

To the ore put in a smelting furnace is often added a certain calculated amount of limestone, iron ore or other material, to act as a flux, that is, to combine with the silica, alumina, etc., forming a readily fusible mixture or slag. This is lighter than the molten metal and floats upon it. Hence the slag and metal can be tapped separately from the furnace.

For the metallurgical processes used with the different metals see ALUMINUM, ANTIMONY, ELECTRO-CHEMICAL INDUSTRIES, etc. Consult also Percy's 'Metallurgy' (1875), and Roberts-Austen's 'Introduction to the Study of Metallurgy' (1902).

SAMUEL SANFORD,
Assoc. Editor 'Eng. & Min. Journal.'

Metamerism. When two or more chemical compounds have the same empirical formula, but consist of different radicals united by an element (or a radical) that is common to them all, the compounds are said to be "metameric," and the property itself is called "metamerism." The common element that unites the radicals is usually oxygen or nitrogen. Good examples of metamerism are afforded by the compound ethers and amines. Dipropyl ether, methyl-amy! ether, and ethyl-butyl ether, for example, all have the empirical formula $C_6H_{14}O$; but dipropyl ether contains two propyl radicals (C_3H_7), methyl-amy! ether contains one radical of methyl (CH_3), and one of amy! (C_4H_9), and ethyl-butyl ether contains one radical of ethyl (C_2H_5) and one of butyl (C_4H_9); the two radicals being connected, in each case, by an oxygen atom. The structural formulæ of these respective compounds are therefore as follows:

Dipropyl ether. $\begin{array}{c} C_3H_7 \\ \\ C_6H_{14} > O \\ \\ C_3H_7 \end{array}$	Methyl-amy! ether. $\begin{array}{c} CH_3 \\ \\ C_6H_{14} > O \\ \\ C_4H_9 \end{array}$	Ethyl-butyl ether. $\begin{array}{c} C_2H_5 \\ \\ C_6H_{14} > O \\ \\ C_4H_9 \end{array}$
---	--	--

The following amines, which all have the empirical formula $C_6H_{15}N$, illustrate metamerism in which nitrogen is the connecting element:

Propylamine. Methyl-ethylamine. Trimethylamine.

N $\begin{Bmatrix} C_3H_7 \\ H \\ H \end{Bmatrix}$	N $\begin{Bmatrix} CH_3 \\ C_2H_5 \\ H \end{Bmatrix}$	N $\begin{Bmatrix} CH_3 \\ CH_3 \\ CH_3 \end{Bmatrix}$
--	---	--

Metamerism may be regarded as a species of accidental isomerism. When metameric compounds are treated with reagents which destroy the bonds between the constituent radicals and the atoms (of oxygen or nitrogen) by which they are united, the several members of the metameric group that is so treated yield totally different products, because they contain totally different radicals.

Metamorphic Rocks, in geology, those rocks whose present form is the result of far-reaching and extreme change, the most frequent metamorphosis being an increase in hardness and in crystalline formation. Thus, both volcanic and sedimentary rocks have been greatly altered. Metamorphic igneous rocks have the original textures characteristic of igneous rocks partially obscured by fissile planes. Metamorphic sedimentary rocks have more clearly the character of the unaltered original in composition; and they furnish the commonest examples

METAMORPHISM—METAMORPHOSIS IN ANIMALS

of metamorphism, namely slate, an altered form of argillaceous rocks, and marble, a metamorphosed limestone. The third class of metamorphic rocks is that whose origin is not clearly traced. See METAMORPHISM.

Metamorphism (Gr. "alteration"), a lithological change, especially chemical alteration and rearrangement, exclusive of the chemical change due to atmospheric action, the product of which is styled residual and not metamorphic. Metamorphism is a more profound change than that effected by decomposition or weathering. Its nature is uncertain, but its result is in general an increase in hardness and in crystallization. See METAMORPHIC ROCKS.

Metamorphism is "contact" or "regional." Contact alteration is due to the near presence of intrusive rock, usually igneous; in this way it is supposed that shales and slates were metamorphosed from argillaceous matter. Regional alteration is the result of movements of the rocks changed and of the areas they occupy; hence it is frequently styled dynamical metamorphism. Under this influence the rock passes through various stages, first hardening, and then becoming crystallized (or re-crystallized), usually with increased schistosity. See GEOLOGY.

Metamorphosis in Animals, the changes which in many animals take place between the time of birth and maturity. The causes are most probably changes of habitat, of seasons, of food, and the acceleration in growth resulting from the approach of sexual maturity. Familiar examples are the change of the caterpillar into the butterfly, of the tadpole into the toad or frog.

In the frog and toad, metamorphosis is complete and thoroughgoing. The embryo on hatching from the egg has a large head and body, but no tail; in a few days its tail grows out and it becomes a tadpole, when it is fish-like, but without fins or limbs. With the growth of the tail, the external gills appear, and the mouth is formed, while the intestine becomes very long and closely coiled. The mouth is armed with horny, comb-like plates, on which develop great numbers of microscopic teeth, which are shed continuously. In changing from the tadpole to the toad or frog, the body, including the skull and rest of the skeleton, and the viscera are made over anew; the external gills disappear as the lungs develop, the true teeth appear in the jaw, the intestine becomes short and straight, and the creature instead of nibbling decaying leaves or dead animals, feeds on living snails and insects. Soon the front legs bud out, the tail becomes absorbed, finally the hind legs grow out, the gills disappear and the adult form is attained. While most amphibians pass through such a metamorphosis, in a few forms, owing to the absence of water or other changes in the environment, development is direct, the metamorphosis being suppressed. Metamorphosis may be retarded by cold, and shortened by hunger, and in the amphibians or in insects the changes are greatest in modern and specialized forms, as frogs and toads.

The metamorphosis of the butterfly is the most complete of those of all insects. The life of the insects is divided into four stages, that is, the egg, larva, pupa, and imago or adult. During the larval and pupal periods the insect is, so to speak, a different animal from the adult.

The caterpillar is provided with big jaws and eats voraciously; in shape and structure it differs widely from the winged adult. The pupa or chrysalis is also different from the larva, and also from the imago; it takes no food and rests almost motionless. On the other hand, the butterfly has no jaws, while its maxillæ form a long coiled up tongue beautifully adapted for probing the corollas of flowers. Though these changes appear to be sudden, the internal alterations of cells and tissue which lead to them are gradual. From one to three days before assuming the pupa state the caterpillar becomes restless and stops eating. If a spinner it spins a cocoon, or if not it enters the earth to undergo its transformation into a chrysalis, or if a larval butterfly it attaches itself to some fixed object as a tree or fence. Profound changes now take place in the mouth-parts as well as the nervous, muscular and other systems of internal organs.

But the changes are most marked in the flesh flies and their allies. At the end of the maggot-stage, the internal organs are destroyed, breaking up and forming a creamy mass, and the appendages and wings arise from minute internal masses of cells called "imaginal buds" which are present in the maggot. The body is thus entirely made over anew. But while the process of destruction of the larval organs and appendages goes on, there is also a constructive process, during which the organs of the adult state are being built up. It is thus evident that the sharp division of the life-history of the insect into larval, pupal and imaginal stages only applies to the external surface of the body. The internal processes of development, on the other hand, form a continuous series of transformations between which is no sharp line of demarcation. Yet as a whole the forms of the larva, pupa, and imago are kept distinct in adaptation to their separate environments and habits.

Hypermetamorphosis.—This name is applied to the changes undergone by certain beetles (*Meloe*, *Stylops*, etc.), in which there are more than the usual number of larval and resting or pupal stages. Thus in the common oil-beetle (*Meloe*) and in the blister-beetles (*Epicauta*) the larva hatches as a minute, active, triungulin creature which is a parasite in bees' nests, feeding on their eggs; it passes into a second larval stage, when it is grub-like, inactive, the body being thick, cylindrical, soft and fleshy; this passes into a motionless semipupa, and thus after molting assumes a footless larval form; it then transforms into a true pupa like that of other beetles. There are thus four distinct larval stages, besides the pupa and beetle. Now these stages correspond to the habits and food of the young beetle, and these supernumerary stages and marked changes of form are evidently due to changes of environment, of habits, and of food, resulting in the atrophy of limbs in certain stages. This throws light on the causes of metamorphism in general.

No Distinct Metamorphosis in the Primitive Insects.—The wingless insects (*Synaptera*) do not pass through a metamorphosis. And it appears, as first suggested by Fritz Müller, that the habit of metamorphosing is an acquired one. Thus in the more primitive winged insects, such as the cockroach, grasshopper, bugs, etc., metamorphosis is incomplete, the young differing mainly from the adult in not having wings. Also the most primitive arthropod animals such as

METAPHOSPHORIC ACID — METAPHYSICS

the horse foot crab (q.v.), the spiders and myriapods, pass through no metamorphosis.

Metamorphosis in the Lower Animals.—The more specialized coelenterates (*Medusa*), the echinoderms, mollusks and crustaceans, as well as many worms, undergo remarkable changes of form. (See *LARVA*.) The larva of the marine annelids is a top-shaped ciliated creature (*trochosphere*) entirely different from its parent. The marine mollusks pass through a larval condition (*veliges*). The young of the sea-urchin, starfish and holothurians differ remarkably from their parents in being bilaterally symmetrical, transparent, and free-swimming; they serve as scaffolds from which the body of the adult is developed. The shrimps, etc., are hatched in a nauplius or six-legged form, and crabs in a zoëa form.

ALPHEUS S. PACKARD,
Late Professor of Zoology, Brown University.

Met²aphosphoric Acid. See **PHOSPHORIC ACID**.

Metaphysics. Metaphysical reflection began with Parmenides of Elea, who, not finding the phenomenalism of the Ionians, or the more formal reflection of the Pythagorean School, satisfactory, was led to deny the reality of the whole world of appearance and to penetrate deeper in his search for the real. In doing so he observed that while the objects of sense are always changing, it is the very essence of thought that it should seize its object as a place of rest and deal with it as a fixity. Τὸ ὄν then, or being, is the permanent and the one. Metaphysically, the world is static and unitary, and the vision which the senses give of it as a plurality of phenomena in a state of incessant motion and change, is illusion. Zeno, another member of the school, developed his dialectic in order to prove the self-contradictoriness of plurality and motion. Plato is at one with Parmenides in regarding being as the object of thought, and as therefore fixed and static in its character. But Plato has also learned the lesson of "becoming" from Heracleitus, and meets the destructive dilemmas of the latter by affirming that being is not one but many, and that the world-process to which Plato ascribes a degree of reality arises from the introduction of the stable or determinate world-elements or ideas into a formless matter, or *ἕλη*, which stubbornly resists the form-giving principle and thus gives rise to the movement or process of the world. But Plato is still so far in bondage to the Eleatic tradition that he regards the ideas, or metaphysical reals, as eternal archetypes prior to the individual beings of the world, and only entering into these beings under the pressure of some *Deus ex machina*. Thus, in the "Timæus," he represents his Demiurge as compounding things out of the ideas as patterns, and the resisting and formless matter. Aristotle overcomes the Platonic dualism by an act that completely emancipates him from the Eleatic tradition. He translates Plato's ideas into forms, endows them with dynamic quality and conceives them to be the immanent principles of the world's order and movement. He is then able to translate the notion of being into terms of becoming, without depriving it of its fixed and stable character. The world of Aristotle is just as much a flux as that of Heracleitus, but Aristotle has an intuition which the older thinker lacked. He sees that the flux itself is

not lawless, but in a sense predetermined, as a passage from the potential to the actual. There is an inner nature of things which constitutes their immanent destiny, and this going on to realize itself determines the whole constitution and process of the world. From this point of view all the terms of Aristotle's metaphysics are to be construed. Matter is simply the world-system regarded as a possibility; form is the same system as actual. Δύναμις, potentiality, expresses the material aspect and the material elements of things; ἐνέργεια, potentiality realized, their actuality, life and movement. The four causes are simply the sum total of conditions material and formal which determine the passage of things from mere potency to actuality. God is the immanent nature, the spring of self-activity, that mediates and determines the world-evolution from the potential to the actual. He is the completely actualized world.

It may be very truly said that the metaphysical intuition of the ancients completed itself in Aristotle. Neo-Platonism contains no real advance on old Platonism, and the mediæval metaphysics that culminated in the system of Saint Thomas does not in any important sense transcend that of Aristotle. In modern times the first real effort toward metaphysical advance is found in the thought of Spinoza. This celebrated thinker is the first to effectually call in question the metaphysical presumption of the ancients that the real is the immediate object of thought. Spinoza rebels against the dualism that represents the real as composed of thoughts and things corresponding to them. He proposes that there shall be only thought and its content. For Spinoza does not identify his two terms in the sense that he regards thinking and being as identical. The world of Spinoza is static, non-dynamic; and the two aspects of it, as he sees it, are (1) thought, regarded as a form of intellection; (2) being, regarded as the immanent object, that is, the content of intellection. God or *Natura naturans* is the world viewed from the standpoint of intellection; Nature or *Natura naturata* is the world viewed objectively as the content of intellection. As objective content, it is manifestation or outer phenomenon; as subjective thought or intellection, it is inner nature or God. If we add to this the fact that the thought of Spinoza is universal rather than individual, we will have noted all the essential terms of his metaphysics which may be characterized as a species of Pantheistic Monism. What is most distinctive in the thought of Kant is his definite and final occupation of the standpoint of epistemology, as the true ground for the determination of the problems of metaphysics. Now in so doing, Kant is making thought the measure of reality, and this seems to be only repeating the judgment of Spinoza. But there is a great difference. Kant declines to accept Spinoza's doctrine of thought and reality. The real is more than the content of thought. In fact Kant returns to the ancient intuition of thought as formal, and the real as in some sense its correspondent. This was also the tradition of Locke and his school, from which Hume departed, and fell, as a result, into skepticism. Now the history of Kant's thought shows that, while he clung to the belief in the mere formal character of thought, his tendency was also strongly in the direction of skepticism. More-

METAPHYSICS

over it was on account of his failure to completely achieve what he calls his Copernican revolution, and which was in fact a reaction toward a constitutive doctrine of thought, that he was never able, during the whole of his critical period, to reach a satisfactory conception of the relation of thought to reality. Had Kant completely achieved the mental revolution he proposed, the result would have been, that in epistemology he would have reasserted the doctrine of Spinoza, the identity of the real with the content of thought. The knowable world would thus have been identical with the real world and Kant would have escaped the dualism between knowledge and reality into which he actually fell. Kant also denies the universality of thought; at least in the ontological sense. The thought that functions epistemologically is my human relative thought which can only pronounce judgments that are subjectively valid for me, but have no ontological value for reality. The Kantian metaphysics is a corollary from his epistemology. What Kant calls critical idealism is first an epistemology, secondly a metaphysic. As an epistemology it teaches that my thought is constitutive for me; that is, that its content is valid for my subjective connotation. It gives me a world, in other words, in which I can work out the practical issues of my life, but it does not give me the world of real things in themselves with respect to which my attitude must be one of renunciation. As a metaphysic critical idealism simply carries its programme out in the field of ontology. The presumption of the identity of what is thought with the real cannot be carried out objectively. Kant's metaphysics is therefore necessarily negative. Thought is able to complete itself ontologically, it is true, but the ideals it reaches have no other than subjective value. Their hypothetical content can never be identified with the real, and the Kantian is per force obliged to represent the whole ontological region as an indeterminate X and to look for the satisfaction of his wants to extra-metaphysical forces. In Hegel we have also an example of a thinker who approaches metaphysics along the epistemological way. But Hegel is a much more thorough-going thinker than Kant. He starts no doubt with the Kantian traditions in mind and his first great task, the development of his logic, is formal. But Hegel is not a formal thinker, in the sense that he divorces content and form. Thought is formal. This Hegel is not afraid to confess, but it is also ontological. At the same time there are no outlying realities, like the Kantian things in themselves. How is this? Are we to have the spectacle of a lapse into Spinoza? Our apprehensions are ungrounded, for Hegel asserts calmly that the form creates the content. Hegel asserts the identity of thought and reality in the sense that the real is, and is only, what the thought thinks it to be. It is the real by virtue of the thought thinking it to be. This sounds like a dangerous kind of subjectivity, till we learn that by thought Hegel means, not my thought or yours, as simply my or your intellectual function, but the thought that is universal and that thinks the universal. So much for Hegel's epistemology. In Hegel's system epistemology and metaphysics are simply two aspects of the same thing. In epistemology we have the system logically conceived; that is

in view of the process which the finite thought of the individual must pass through in order to apprehend it; whereas in the metaphysics we have the system presented in its unity as a self-completing whole. Epistemologically the dialectic is the movement by which results are achieved; metaphysically it is the Divine Spirit of the system as a whole. After Hegel there is no other thinker of great metaphysical significance, except Lotze, in whom we have a reversion to the Kantian tradition in regard to the formal character of thought. Like Kant, Lotze is primarily an epistemologist, and he adheres to the formal character of thought in the Kantian sense; that is, in the sense of Kant's actual achievement in which the Copernican revolution is left incomplete. Lotze not only asserts the formal character of thinking, but also more distinctively than did Kant, the distinctness of the order of thought from the order of things. The great question in epistemology for Lotze is, how the order of thought is to be made valid for the order of things. Now we are directly concerned with epistemology here, and can only stop to indicate that this is to be achieved by a kind of breaking in of the real order on the order of thought at various points; in short by the working of an epistemological miracle. It is true that Lotze attempts to buttress his miraculous intervention with the *a priori* necessities of thought itself; an attempt which supplies an interesting topic for criticism. The nexus between the Lotzean epistemology and metaphysics is to be found in the conclusion of the former; namely, that the order of thought may be taken as valid for the order of reality and consequently thought may be employed as an agent of metaphysical judgments. From this point the Lotzean metaphysics may be summarized as follows: Starting with Kant's doctrine of things in themselves, Lotze is dissatisfied with their negative and indeterminate character. This leads him back of Kant to Leibnitz in whose monads he finds conceptions of reals which have a determinate nature and which are, therefore, to some extent knowable. Fundamentally, however, this monadology is a system of pure pluralism. The reals are independent and relationless. Leibnitz is nowhere able to overcome the atomism of his system. Now Lotze, in adopting the Leibnitzian real, modifies it by conceiving it, after the analogy of sociality, as internally susceptible to modification from its fellow reals. The form which this susceptibility takes is the dynamic one of interaction. Out of the mutual and reciprocal interactions of the metaphysical reals emerge all the movements and changes that make up the phenomenal world. Lotze also qualifies the pluralism of Leibnitz by postulating, as the necessary ground of the existence and unity of things, a universal substance or unitary being, which supplies the absolute term in the metaphysical conception of the world. This absolute is open to two criticisms that may be simply indicated here. Ontologically it threatens a return to the Pantheism of Spinoza, while epistemologically it is in danger of succumbing to the pluralism for which it was postulated as a cure.

II. All metaphysics arises out of the question whether thought is adequate to the apprehension of reality. This question may be answered

METAPHYSICS

either negatively or affirmatively, and each of these answers will have two generic forms. The negative answer will take the form either of skepticism or agnosticism, while the positive answers may be characterized as materialism or spiritualism. The first form of negation, skepticism, will arise either directly out of a dogmatic denial by reason of its own powers, or, as is more often the case, from the standpoint of sensationalism. In general, it may be said, that ancient skepticism was dogmatic; while modern forms are as a rule sensational. Thus, the earliest form of skepticism on record, that of Heraclitus, arose immediately out of the perception that a system of perpetual flux supplies no points of sufficient stability for the judgment, so that while being pronounced it loses its ground. Could Heraclitus have discovered a single point of rest in his world he would have been in a position to become a positive thinker. The early Sophists became skeptical because they had lost faith in reason. The first proposition of Gorgias was that nothing exists; meaning, that our thought or reason supplies us with no rational data for asserting anything to exist. The other propositions of his negative creed depend on this ontological pronouncement and have little relevancy apart from it. Coming down to Pyrrho and the later skeptics of the Academic School, we find that their skepticism, while differing in degrees, has this one point of agreement that the object of its denial is the ontological value of thought or reason. Thus, while Pyrrho seems more radical in his negations than the Academic of Cicero's time, the reason is psychological rather than metaphysical and is to be found in the development of the category of probability which came gradually into vicarious service for reason. The judgment of probability thus gradually asserts itself as an organ of certitude, and we find Cicero restating all the Platonic proofs of immortality in order to establish its probability. Modern skepticism, of which that of Hume may be taken as representative, springs directly out of sensational soil. Hume asserts that all real data of knowledge are sensible; consequently reason, which professes to go beyond sense and assert the metaphysical, is a faculty of illusion. Metaphysics is therefore a science of illusion and the judgment of reason is valueless; except so far as it can find its guarantee in the data of sense. The Humian, as a rule, becomes sceptical of reason for its own sake; but the ground of his denial of the value of his ontological judgments will be to seek in his already adopted sensational criteria of reality. There are modern forms of metaphysical skepticism that do not spring directly out of sensational soil, as for example that of Kant which finds its immediate motive in the inevitable self-contradictions into which reason is said to become involved in dealing with metaphysical issues. Kant, however, is not to be ranked as a skeptic, but rather as an agnostic. The term Agnosticism, as well as the thing it signifies, is a distinctive product of the modern mind. It could arise only after a critique of recognition had shown that dogmatic negations of an ontological character are without value; in other words, that no *a priori* limits to existence can be determined. Having reached this insight the agnostic is the one who finds, in this inability of reason to determine the negative limits of

existence, evidence of its inability on the positive side to determine the nature of existence. The starting point of agnosticism is thus epistemological; it is primarily a question of knowledge, but in the last analysis its motive is metaphysical. Agnosticism is a name for the denial that metaphysical reality can be satisfactorily asserted. In modern thought it has taken two forms; the one, which has allied itself with Positivism, taking the radically phenomenistic ground that neither the existence nor the nature of what Mr. Lewes has styled the *suprasensible* can be affirmed; the other form being that of Herbert Spencer and his school, in which the existence of the metaphysical is asserted, but the possibility of intelligently defining its nature is denied. Of this species of negation Kant is the progenitor in the general position which he develops in the third section of his great work, the 'Critique of Pure Reason.' Here he maintains the necessity of postulating in thought the existence of the metaphysical objects, while denying to such postulates ontological validity.

On its positive side metaphysics has tended to be either materialistic or spiritualistic. Metaphysical materialism is a theory that admits the competence of reason to determine the ultimate nature of the real. Its distinctive feature is its assertion that the original type of being to which the world is to be reduced is to be found in the object rather than in the subject, in matter rather in mind. Such a doctrine may be crudely phenomenal, like the *hylozoic* theories of the Ionians. It may be ontological and mechanical, like ancient atomism and its modern counterparts, in which the attempt is made to conceive the mechanical evolution of the world out of the movements of the pure material elements. Or it may find its objective term in the nervous system and its metaphysics be a postulate of brain psychology. On whatever data it essays to build, matter rather than mind will supply it with its ontological categories and types of being. Thought, wherever it may show itself, will not be regarded as a *vera causa* but rather as a phenomenon or even an *epi-phenomenon* of the material. The modern forms of materialism are more subtle than the ancient, and they are less dogmatic in their tone; this result arising partly no doubt from the confessed inability of a materialistic metaphysics to deal rationally with many of the vital concerns of humanity.

Materialism stands, on the whole, defeated before the bar of modern thought. The insight of the modern mind is one that owes more to Plato and Aristotle than to Democritus. Its metaphysical systems have for the most part been spiritualistic, if we use that term in the broad philosophical sense. Now we have defined materialism in the light of its ontological character, and spiritualism may be defined in the same way as a metaphysical construction of the world that seeks its ultimate categories and types of being in mind rather than in matter. The first genuine spiritualistic insight which the history of philosophy records is that of Anaxagoras, who finds in thought or intelligence the only principle that can supply an adequate explanation of the order and unity of the world. This germ is developed by Socrates, Plato, and Aristotle into a system of thought that may be called spiritual idealism. Modern spiritualism has embodied itself in both realistic and idealis-

METAPHYSICS

tic forms. Under the former we may note, first, Scottish realism, in which on an intuitional epistemology, a spiritualistic metaphysics of a pronounced theistic type is built; secondly, the German school of transcendental realists beginning with Herbart and completing itself in Lotze. This school, as we saw in another connection, rests on a Kantian epistemology, but through the mediation of the Leibnitzian monad achieves a thoroughly spiritualistic metaphysics of reality. The idealistic forms have played, on the whole, a more important role in modern thought than have the realistic. Space will permit only a brief mention of three of these forms. First, Berkeleyanism, which proceeds from the empirical epistemology of Locke to a spiritualistic and distinctively theistic metaphysics; secondly, the movement called transcendental idealism starting with Fichte's moral egoism and culminating in the absolute idealism of Hegel, a system in which epistemology and metaphysics are related to each other as thought and content. Later developments of Hegelism have received the name of speculative idealism, a rubric under which it is possible to include such diverse thinkers as Edward Caird, F. H. Bradley, and Josiah Royce. The third form is that of Schopenhauer and may be called voluntarism. This form finding its types and analogies in will, rather than in thought, leads to a metaphysical doctrine of the world, in which the will holds a central place. The voluntaristic type of idealism is one that tends either toward the metaphysical ideal indicated; or setting aside the distinctively metaphysical motive, it may under the name of Pragmatism seek to construct a theory that will combine the purely phenomenalistic with the practical.

III. Attention has been called above to the widespread negative attitude that has been taken, in modern times especially, toward metaphysics. This has been caused partly by the despair of philosophers of ever arriving at results on which men could come to definite agreement. This despair has been reinforced from the outside by the wholesale denial of the value of metaphysics that has been indulged in by men of science. We are not concerned with this situation further than to call attention to it, and to infer from it the possible necessity of developing a concept of metaphysics that will make the connection of the metaphysical enterprise with experience, and with the investigations of science, more obvious than they have been made by the older conceptions. Let us start with the presumption that neither science nor metaphysics exists by any divine right, but are instruments which man employs in order to satisfy his demands and interpret his experience. Man finds himself related through his experience to a world which he seeks to penetrate by his intelligence and overcome by his will, in order that it may become the means of the realization of the ends of his existence. This struggle antedates both science and metaphysics. And as the physical needs are most clamorous, the first efforts will be devoted largely to their satisfaction; and it will be only through the physical struggle for existence that man will begin to recognize himself as a subject of spiritual experiences and needs. Naturally, then, the first need of man in order to supplement his ordinary experience will be science that will enable him to increase

his command over the forces and resources of nature. But just as the physical struggle awakes the spiritual in man, so the effort of science to penetrate the physical secrets of nature will lead to points where the physical will be transcended and the necessity of the spiritual interpretation will assert itself. In order to show how normal the demand for the metaphysical is, it is only necessary for us to realize clearly the standpoint and method of its rise. To this end, let us consider briefly the points of view, categories and methods employed respectively by science and metaphysics. Reverting to our representation of man as a being who seeks through his experiences to penetrate and overcome his world, we find, by considering his situation, that there are at least two points of departure from which he sets out to actively overcome his world. The first and most obvious is the external and objective in which, taking the position of an observer or spectator, he observes the movements of his world, with a view to generalizing them and, through these generalizations, getting command of the underlying forces or agencies of which the movements are the phenomena. Now this standpoint is the identical one occupied by science, and the presumption with which it sets out is that of non-community of nature between the investigating subject and the object investigated. In other words, the consciousness that observes the object must be careful to abstain from any and every assumption that the nature of its object may be conscious like itself. The investigator must, in short, restrict his activity to observing the conduct or movements of things in their pure externality, uncolored by any presumption as to what the things they manifest may be in themselves. The most obvious categories in this stage will be those of space, time, and motion and the method will be physical and mechanical. As the scientific construction advances the necessity for something deeper than this will, of course, arise. The motions of things, of themselves, are mere phenomena until they have been connected by the notion of cause, to the persistent but hidden agencies to which science applies the term forces; or in their aggregate, matter. In short, science, in order to justify its own procedure, must at a certain point rationalize its world by connecting the outer movements, with which it deals directly as symbols or phenomena, with a system of underlying grounds or forces. These forces themselves will be construed, however, by science as physical, therefore as spatial, and their relations will be quantitatively, that is, purely externally and mechanically, conceived. Science will thus end as she began, an instrument for the interpretation of the world in the terms of the physical. And this character will be maintained even when the object investigated is mind itself, for then the psycho-physical parallelism will be introduced as a means of translating all mental phenomena into physical equivalents.

In all this effort to explain its world, however, the subject has abstained conspicuously from the employment of its own analogies in the interpretation of its world. We are led naturally to ask, is there not a legitimate and necessary function somewhere for these analogies to perform? and our question leads to the discovery that there is another point of view in experience, beside that from which man spec-

METAPHYSICS

tates his world, and that is the central standpoint in consciousness, from which his consciousness goes out in its volitional effort to overcome and realize its world. The effort here takes the form of the agency of a conscious self and this agency embodies itself in teleological rather than mechanical form; that is, in a process that is motivated by an ideally formed interest, which, through the mediation of purpose, passes on to the realization of an end. This end is the ideal embodied in the purpose, and conceived in the ideally formed interest. A man has only to study his self-activity, as involved in his volitional agency, in order to realize the truth of this description. Now, just as we saw that science seizes upon the standpoint of outer observation, and translates it into an organ for the physical interpretation of the world; so here metaphysics lays hold of this inner movement of realization and translates it into an organ of spiritual interpretation. And, as science employs the analogies of the physical alone, on the assumption that the object is alien to the nature of the consciousness, so here metaphysics employs the analogies of the spiritual, on the presumption of a community of nature between its object and consciousness. The standpoint of metaphysics is, then, that of the inner conscious effort that springs directly out of our self-hood. The categories of metaphysics are those of ideal-purpose, and end-realization, and it is of teleological rather than mechanical interpretation.

Having indicated as briefly as possible the most characteristic features of what we call the metaphysical interpretation of things we are in a position to consider two questions: (1) the real connection of science and metaphysics; and (2) the relation of metaphysics to general philosophy. As to the first question, the relation of the two disciplines is so obviously not one of conflict or mutual exclusion, but rather of complement and mutual completion, as to give to the persistent blindness that reigns in some quarters a certain air of absurdity. The foes that are being girded exist only in imagination. But seriously speaking, the motive of metaphysics is that and that alone which animates any serious-minded man when finding the physical world too narrow and cramping, in his effort to achieve an interpretation of things that will leave more scope and freedom for the realization of that which he cannot but deem highest, uses as a key to this interpretation the categories of a nature that lives and consciously aspires in his own breast. Man needs the metaphysical interpretation, whether he be consciously a metaphysician or not; and the man of science, if he be gifted with reflective powers and some insight into experience, will be the last to cast a stone at a discipline for which he so clearly prepares the way. (2) The relation of metaphysics to general philosophy may be expressed in various ways. In the first place by way of inclusion; philosophy embraces epistemology as well as metaphysics. Or if we have regard to the disciplines ordinarily included under philosophy, then metaphysics will find itself in company with psychology, ethics, logic, aesthetics, and the philosophy of religion. Here, however, the vital category is not inclusion but synthesis. The comparison of the aims and methods of science and metaphysics teaches us that neither alone is adequate to meet the demands of man,

or to completely interpret the world. The demand of knowledge, as well as the demand of our practical interests, is for a synthesis of the insights, methods, and results of science and metaphysics. This synthesis, in which the unity of knowledge and life is realized, is the function of philosophy. True philosophy conserves the needs both of science and metaphysics.

In view of the skepticism with which they are often met, the central task of metaphysics becomes that of enforcing the legitimacy of its own interpretation. So long as the claims of metaphysics are debated in connection with the abstract questions of existence and reality or universality and individuality, there may be difficulty in maintaining them against the objections of either science or common sense. Let us, however, set out by understanding the demand for the metaphysical interpretation of things arises in the experience of both the plain man and the man of science, and that it takes the form of a refusal to be satisfied with a world in which the first as well as the last issues are strictly and fatalistically determined by material forces and agencies; in short, with a world from which forethought and will are rigidly excluded. This refusal rests on man's conviction that it is in this field of conscious thought and will-determination that the most vital interests and most fundamental issues of his being arise, and that to those a mechanically-determined world would be indifferent, if not inimical. Once convinced of this, the mind of the most determined foe of the traditional metaphysics will be prepared to admit that a very natural and legitimate interest attaches to the question whether the scheme of world-interpretation may not be so enlarged as to include the problem of the co-ordination of the two spheres of experience: that of material and mechanical agencies on the one hand, and that of the agency of forethought and purpose on the other. If the legitimacy of such a consideration be conceded, the whole problem of metaphysics is on our hands, for the claim of metaphysics is simply that an adequate conception of things is one in which forethought and purpose are to be regarded as necessary pre-suppositions of the material and mechanical. In view of this we may add to Mr. Bradley's definition of metaphysics as "an unusually stubborn effort to think clearly," this other that metaphysics is an unusually stubborn refusal to admit the adequacy of a world-theory that does not refer the world in the last analysis to forethought and purpose.

METARGON — METEORITES

Metar'gon, a gaseous substance obtained, apparently from the atmosphere, in the experiments of Ramsay and Travers upon argon and krypton (qq.v.). It was for a time believed to be a new element, but was later shown to be merely carbon monoxid, which had been introduced by the unsuspected presence of carbon in the phosphorus that they had used for depriving the air of its oxygen.

Metastasio, **Pietro**, pē-ā'rō mā-tās-tā'zē-ō (properly PIETRO TRAPASSI), Italian poet: b. Rome 6 Jan. 1698; d. Vienna 12 April 1782. His poetical talents were early displayed in improvisations, and often he drew about him a crowd to listen to some versified narrative. The jurist Gravina, who thus accidentally became acquainted with his talents, took him under his protection, called him (by an Italianized translation of his name into Greek) *Metastasio*, paid great attention to his education, and on dying in 1717, left him an estate of \$20,000. On 15 April 1718 he was received into the Arcadian Academy with the name of Artino Corasio, and in 1720 entered at Naples the office of the attorney Castagnola, who discountenanced literary work, and kept him severely to the law. He wrote anonymously 'Gli Orti Esperidi' (1722), but the authorship was soon revealed, and Metastasio left the lawyer's office, studied further, and wrote a series of musical dramas, or melodramas in the true sense, which were set by leading composers and given with great success. In 1730 he settled in Vienna as court poet, and there in 1730-40 wrote his best works, 'Demetrio,' 'Issipile,' 'Demofoonte,' 'La Clemenza di Tito,' 'Attilio Regolo.' In the consideration of Metastasio's rank as a poet, his work must be viewed not absolutely, but with regard to its original environment, as done in collaboration with a composer, and rendered by great artists. He wrote, too, for the predominantly vocal system of Italian musical drama; and with this his poetry fell into comparative neglect. His writings have been praised by so good a critic as Symonds for excellent versification, ease of diction, effective simplicity of construction, and frequent imagery of the highest rank. His lyrical verse and criticisms are also of value. The best collected edition of his works is that of 1780-2 (Paris). Consult: Massafa, 'Pietro Metastasio' (1882); also Lee, 'Studies of the 18th Century in Italy' (1880).

Metastasis, (1) in medicine, a change in the seat of a disease, attributed to the translation of morbid matter to a part different from that which it had previously occupied, or to the displacement of the irritation. (2) In botany, a change produced upon a substance designed for the nutriment of a plant, to make its assimilation more easy. Thus, when the starch formed in the leaf of a potato has to be transferred to the tubers as a depot of nutritive material, it is first changed into a soluble substance — glucose.

Metathē'ria, a group-name, not now used, applied to the *Didelphia*, or marsupials, indicating their distinction as a medium subclass between the *Prototheria*, or monotremes, and the *Eutheria*, or higher mammals; but such distinction does not exist in the latter case. See MAR-SUPALIA.

Metaurus, mē-tā'rūs, or **Metauro**, mā-tow'-rō, Italy, a river in the Marches: which flows

northeast past St. Angelo in Vado, and falls into the Adriatic, southeast of Fano; total course, about 50 miles. It is noted for the victory gained by the Romans under the consuls Claudius Nero and Livius Salinator near its banks over the Carthaginians under Hasdrubal 207 B.C.

Metavoltine. A sulphur-yellow mineral occurring in aggregates of hexagonal scales at Madeni Zakh, Persia. Dichroic. Hardness, 2.5; specific gravity, 2.53; composition: Sulphuric acid, 46.90; sesquioxide of iron, 21.20; protoxide of iron, 2.92; potash, 9.87; soda, 4.65; water, 14.58. Much of the mineral called misy belongs to this species.

Matayer, mē-tā'yēr, Fr. mā-tā-yā. (L. Latin, *medietarius*), a name given in France to the cultivator of a *metairie* or farm who reserves for himself one portion of the produce as the price of his labor and gives the proprietor the other, which represents the rent of the land after deducting what is necessary to keep up the stock. The greater part of the centre and south of France, and almost the whole of Italy, is cultivated by matayers, who are in general upright, economical, and industrious, but ignorant, poor, unenterprising, and not disposed to adopt those systems of agricultural improvement which alone can fully develop the productive powers of the soil. It has, therefore, been keenly debated whether or not the suppression of this class of cultivators would be a national benefit.

Metazo'a, one of the two great sections into which Huxley divides the animal kingdom, the other being the Protozoa. The Metazoa embrace all animals composed of more than a single cell. See ANATOMY, COMPARATIVE.

Metelli, mē-tē'l'i, a Roman family of the gens *Cæcilia*. QUINTUS CÆCILIUS METELLUS MACEDONICUS defeated the Achæans, took Thebes, and invaded Macedonia, etc., and received a triumph 146 B.C. QUINTUS CÆCILIUS METELLUS NUMIDICUS rendered himself illustrious by his successes against Jugurtha, the Numidian king. He took, in this expedition, the celebrated Marius (q.v.) as his lieutenant; was soon recalled to Rome, and accused of extortion and ill-management, but was acquitted of these charges. He celebrated a triumph at Rome 107 B.C. His son, QUINTUS CÆCILIUS METELLUS received the surname of PRUS on account of the love which he displayed for his father when he besought the people to recall him from banishment in 99 B.C. In 83 B.C. he joined Sulla, with whom, three years later, he was united in the consulship. QUINTUS CÆCILIUS METELLUS CRÆTICUS conquered Crete, and reduced it to a Roman province in 67 B.C. QUINTUS CÆCILIUS METELLUS PRUS SCIPIO, the adopted son of Metellus Pius, in 52 B.C. was colleague in the consulship with Pompey, who had married his daughter Cornelia. Hence he exerted himself to the utmost to destroy the power of Cæsar and strengthen that of his son-in-law. He commanded the centre of Pompey's army at the battle of Pharsalia, and thereafter fleeing to Africa was defeated by Cæsar at Thapsus 46 B.C. He died by his own hand.

Metempsycho'sis. See TRANSMIGRATION.

Meteorites. It is not certain that the distinction commonly made between the smaller meteors, called shooting stars, and meteorites

METEOROLOGICAL SOCIETY—METEOROLOGY

rests upon any essential difference in their physical nature. It has been suggested that while meteorites are solid compact bodies, often of great size and weight, shooting stars may be mere puffs of dust or gas. Both, however, move before encountering the earth with great velocity, in orbits controlled by the gravitation of the sun. The fall of a meteorite is a sporadic occurrence, and no connection has been proved to exist between such falls and the recognized showers of shooting stars, although a small meteorite did fall at Mazapil in Mexico during the display of the Andromedes in 1885. This meteorite, which weighs about ten pounds and is composed of iron alloyed with nickel, is now in the Vienna Museum.

Meteorites are of two classes—the stony meteorites and the iron meteorites. The former are about ten times more numerous than the latter. In the iron meteorites iron usually forms more than 90 per cent of the entire mass, but it is almost invariably alloyed with nickel. In the stony meteorites mineral combinations occur which are peculiar to these bodies, and serve as one of the ear marks by which they may be recognized when they were not seen at the time of their fall.

Other distinguishing marks of meteorites are found in their physical appearance and structure. They are covered with a blackish crust formed by surface melting during their passage through the air. This crust consists mainly of oxide of iron, and is magnetic. Pits and hollows scooped in the surface of a meteorite by the fusing of the less refractory minerals also form a characteristic feature.

When a portion of the surface of an iron meteorite is polished and then etched with acid peculiar markings, called from the name of their discoverer Widmannstätten figures, make their appearance. These are among the most trustworthy criteria of the meteoric origin of suspected masses of native iron.

About one third of the chemical elements known in the laboratory have been found in meteorites. But no new element has ever yet been discovered in them. The following elements occur, in greatly varying quantity, sometimes a mere trace being present:

Iron	Carbon	Oxygen
Nickel	Sulphur	Hydrogen
Cobalt	Phosphorus	Nitrogen
Copper	Silicon	Chlorine
Aluminum	Sodium	Chromium
Tin	Calcium	Titanium
Magnesium	Potassium	Lithium
Arsenic	Manganese	Helium

As the true nature of shooting stars was not understood until after the investigation that followed the great shower of 1833, so the true nature of meteorites was recognized only after a remarkable fall of those bodies which occurred at L'Aigle in France about noon on 26 April 1803. Nine years before, in 1794, Chladni, a German physicist, had formulated the theory that meteorites before encountering the earth traveled in independent orbits in space, but his conclusions were not generally accepted until the occurrence at L'Aigle had focused the attention of men of science. On that occasion between 2,000 and 3,000 meteoric stones were scattered over an area about nine miles long by three miles wide. The French astronomer, J. B. Biot, visited L'Aigle, carefully examined

the fallen stones, and collected and discussed the evidence of eye witnesses. Thereafter the old idea that meteors and meteorites were simply atmospheric phenomena was abandoned, and the fact of their extra-terrestrial origin was generally recognized.

Many records of the fall of meteorites have been found in ancient annals, and in modern times, with so many observers continually watching the sky, the number of meteorites seen in flight is annually quite large, although the actual falls observed are always comparatively rare. The number entering the earth's atmosphere in a year has been estimated all the way from 70 up to 3,000 or 4,000. In 1879, on 10 May, there was a shower of meteoric stones in Iowa, the largest mass weighing more than 400 pounds.

Perhaps the most famous meteorite of antiquity was the so-called stone of Egos-Potamos, which fell in Thrace in 466 B.C., and which was described as equaling two millstones in size. Plutarch speaks of it in his life of Lysander. In the Middle Ages the Stone of Eusisheim was very celebrated and became the object of superstitious reverence. It fell at Eusisheim in Alsace on 7 Nov. 1492, when the Emperor Maximilian was at that place. Fragments of this body were taken to Paris and to London, but the principal mass, weighing more than 200 pounds, was suspended in the choir of the church of Eusisheim.

Almost every large meteorological museum contains specimens of meteoric stones and meteoric irons. There are some remarkable examples in the National Museum at Washington. An iron mass, supposed to be of meteoric iron, discovered at Cañon Diablo, Arizona, proved, on examination a few years ago, to contain minute black crystals resembling the diamond, and a meteorite which fell in Russia contained similar black crystals of carbon.

It is yet a disputed question whether the huge masses of iron, weighing many tons, which were brought from Greenland to Stockholm by Baron Nordenskjöld, are really of meteoric origin. The same question attaches to a similar mass which Lieut. Peary transported from Greenland to New York. Other masses of this kind exist in various parts of the world. There is no record of their having fallen from the sky.

GARRETT P. SERVISS,
Author of 'Other Worlds.'

Meteorological Society, The Royal, a scientific body with headquarters in London. Its organization dates from 1850, and in 1866 it was incorporated. All theories and facts pertaining to meteorology are sought for its records, the development of that science in all departments being the object of the association. Besides fellows, the society consists of honorary members, this membership being bestowed upon distinguished persons of other than English nationality. The society publishes the 'Meteorological Record' and the 'Quarterly Journal.'

Meteorology (τὰ μετέωρα+λόγος) literally, the science of the things in the air. Meteorology originally included all the phenomena of the air, but many of them are now brought into the realm of astronomy. Meteorology, as the term is understood at the present day, may properly be considered under two heads:—theoretical

METEOROLOGY

meteorology and applied meteorology. Theoretical meteorology will be treated in this article as briefly as is compatible with an intelligent understanding of the subject, and special prominence will be given to applied meteorology in its practical aspects in the United States, particularly in its relations to the manifold and all-important interests of commerce and agriculture.

Theoretical meteorology aims to explain all the various atmospheric phenomena by physical laws, and to reduce them to an accurate and scientific basis. It must then include a discussion of the control of temperatures by the sun and their distribution over the globe, together with the different winds resulting from temperature differences; the moisture of the air in its various forms of invisible vapor, cloud, dew, frost, rain, and snow; and finally, an investigation of storms (or cyclones as they may properly be termed), of varying degrees of intensity, that from time to time pass over the land and the sea; their causes and growth, together with their concomitants of destructive winds and heavy precipitation. The study of these phenomena is the province of the meteorologist and physicist, and a successful solution of the problems that they offer is a goal worthy of man's highest ambition and most earnest endeavor.

History.—From remotest antiquity men's minds have been occupied with the ever-varying changes of the weather. The kaleidoscope of the sky, the seasonal changes, and all the elements that affected his comfort and the necessities of his life, arrested the attention of primitive man. Living for the most part in the open air, with imperfect protection from the inclemency of the weather, he was quick to note all appearances that experience had taught him heralded future weather changes. Thus there naturally and insensibly came into existence a mass of weather proverbs that were eagerly remembered and handed down from generation to generation, so that to-day there is no science that is so thoroughly incorporated in the language and folk-lore of the past. The name science is hardly applicable, however, to meteorology as it then existed, as there was no definite knowledge of its phenomena or of the laws that governed them, prognostics being based solely upon the shifting of the wind, the actions of birds and animals, and other local signs of impending changes.

Naturally, there was but little progress made until there were some suitable means of measuring the fluctuations of the different elements. The invention of the thermometer previous to 1597 and the barometer in 1643 marked a new era, and with the use of these instruments careful and continuous observations were begun, and an impetus given to systematic study and research, that has resulted in a fairly good understanding of the subject to-day.

In the United States.—The history of meteorology in the United States may well be divided into two periods:—the first ending with the inauguration of a national weather service under the control of the government, the second extending from that date to the present. In the second period the history of the weather service is virtually the history of meteorological progress, the conditions being such that the work of investigation could, in the main, be carried

on more successfully under its control than by individuals or by private enterprise. From the time of the first settlement in America records of temperature and precipitation, of various degrees of accuracy and usefulness, were kept in different parts of the country. The first movement toward bringing any sort of order out of the chaos that reigned was by Benj. Franklin (q.v.), who from correspondence with friends, found that some storms moved in a northeasterly direction over Philadelphia, their force being felt in Boston some 12 hours later. Simultaneous observations in Virginia by Thomas Jefferson and Mr. (afterward Bishop) Madison also showed that some definite law governed the progress of storms, with their accompaniments of precipitation and wind.

In England, Hadley had in 1735 published an article promulgating a theory explanatory of the trade-winds, but unfortunately it was comparatively unnoticed for 50 years. An essay by Dalton, also an Englishman, in 1793, marked an epoch in meteorology, as it was the first instance of an attempt to apply the principles of philosophy to an explanation of the phenomena of the atmosphere. From time to time charts of different kinds were constructed and various views were put forth regarding storms, the consensus of opinion being that they were straight line gales. In 1831 Redfield, in America, published his first essay, which contained the important suggestion that storms were great revolving whirlwinds turning counter clock-wise, with a progressive movement toward the northeast. Later he described the warm southerly winds on the easterly side of storms and the cold northerly winds in the western quadrants, maintaining that these winds neither flowed radially inward to the storm centre nor in circles about it, but spirally inward. In 1841, at about the time that the laws of thermo-dynamics were being formulated, Espy showed that ascending air expands and cools its vapor to the point of saturation, thereby causing rainfall; also that descending air is warmed by compression and clouds are thus dissipated; and that the daily heating of the lower strata of the atmosphere causes convectional currents and the formation of cumulus clouds.

A long controversy ensued as to the respective merits of these two theories of storm formation, it being at the present generally conceded that both causes are effective to a certain extent.
